The Oxford University Press will pub shortly another volume by Mr. Francis B in the "English Church Art" series entit "The English Chancel." A detailed hist is given of the English altar and its succes the Communion table; also of the seventeen century controversies by which altar rails w introduced and placed sometimes on all f sides of the table, sometimes on three sides, a finally on the west side only; with this incorporated an account of the various for of the English reredos and other accesso of the altar. Then follows a description the piscina in both its forms, the crede shelf, and the sedilia. The existing examp of the Easter sepulchres are illustrated, ritual of Passiontide described, and the sed and piscina and other contents of the Engl chancel are fully illustrated.

Portland Cement Production in the U.S.A., 19

H.M. Consul-General at Chicago (Mr. H. Nugent) reports that according to an estim of the output of Portland cement in the Uni States in 1915, made by the United Sta Geological Survey, the production was ab 85,732,000 barrels (of 380 lb. net), as compa with 88,230,170 barrels in 1914, a decrease 2·8 per cent. The stocks of finished cem at the mills amounted to about 11,583, barrels as compared with 12,893,863 barrels 1914, a decrease of 10·2 per cent. The sli decrease in production and the considera decrease in stock indicate greater caution in industry, which in the preceding few ye showed a tendency towards over-producti The general prices averaged a few cents lo per barrel in 1915 than in 1914, althou towards the end of the year they were c siderably higher. The statistics show t the general volume of business was about same as in 1914. The outlook for 1916 stated to be brighter than for several years.

BOOKS.

Arts in Early England. By PROFESSOR
LDWIN BROWN. Vols. III. and IV.
Saxon Art and Industry in the Pagan
riod."

E two volumes comprise a peculiarly
ugh and searching analysis of the subject,
have been prepared with a keen regard
accuracy and clear exposition. In his
tory note the author explains the plan
which the work has been constructed
his methods of reference, and he may be
atulated on having presented an immense
of information in a convenient form for
tudent, who will not fail to recognise the
of the book as a complete and exhaustive
of reference.

e art of the Anglo-Saxons is probably
tle studied and understood as any of the
ds and phases of artistic expression, and
ssor Baldwin Brown has done a great
e in illustrating its scope and peculiarities
such thoroughness and minute description.
illustrations are prolific and are photo-
ic, and are not only very clear but in
cases the scale is indicated, an important
l where ornament is concerned.

e author, in the Preface, alludes to the
lar estimation of the Anglo-Saxon as of
lid and inartistic race, but even a cursory
ination of the evidence in these volumes
serve to expose the fallacy of such a view.
the whole, while the art of the Anglo-
ns might in a degree be described as
aric, it compares with the general mass of
ish ornament of the present day to the
ment of the latter; there is a directness
urpose and a logical simplicity of design
craftsmanship displayed in many of the
ts illustrated in this work which seem
e generally lacking to-day. This is par-
arly noticeable in the fibulæ and similar
les of dress or jewellery. The author has
careful in tracing the origins of the orna-
al forms and motives characteristic of
work of the Anglo-Saxons, and while it is
itted and obvious that most of these
ves have a precedent or parallel in the
of the Romans, the Celts, etc., he very
y claims a definite degree of originality and
l characteristic for the Saxons.

very large proportion of the objects illus-
d consist of fibulæ or brooches, and other
s fastenings, and coins, and those whose
aintance with the art of this period is
rficial and whose interest has been only
al will be astonished at the degree of
nical skill and artistic ingenuity displayed
the Anglo-Saxon craftsmen. In some of
borrowed motives, notably those derived
Roman sources, there is a certain tendency
rds coarsening, but on the whole the
rtures from precedent are marked by a
ur and purpose which entitle them to
ideration as genuine works of art.

s the author remarks, nearly all the objects
red to and illustrated in these volumes
been discovered in Anglo-Saxon burial
nds, hence the preponderance of brooches
articles of personal adornment. Some
ters are devoted to these burial grounds,
to the history and locality of the migration
settlement of the races in question, and,
ough of more interest to the antiquary
the art student, these considerations are
tial to the right understanding of the
ect and throw considerable light upon it.

x chapters come under the heading of
b Furniture, and deal successively and
etail with the classes of objects found in
tombs and graves. A valuable analysis of
technical processes employed is given in
pter VI., and is especially instructive and
ul in forming an estimation of the artistic
e and significance of the objects under
ussion.

ith regard to questions of design and
stic motive, in his desire to trace origins,
ses, and precedents the author is perhaps
ned to give too little credit to spontaneous
inality. Take, for example, the spiral, a
mon natural form which may in many
s as well owe its origin to the mind and
y of individual craftsmen as to a deliberate adaptation from precedents in artistic expression.

Amongst the profuse collection of illustrations of these English works of long ago there are too many examples of excellence to make individual reference desirable, but mention may be made of the Kingston Brooch, admirably shown in colour on the frontispiece, and the cruciform fibula illustrated on Plate XLIV., both of which in themselves are sufficient to command our respect and excite interest in the period, and the people who produced them.

Some Sketches in France.

BEAUVAIS.

THE cathedral was begun in 1225, but in 1284 the choir vaults fell in and completely ruined the building, which had to be rebuilt. Work on the transepts was only commenced in 1500. They were finished in 1548. Not content with so vast an achievement, the erection was commenced of a great tower over the crossing, 153 metres high. To attempt this before having even started the nave proved a costly blunder, as the piers of the crossing, lacking the necessary abutment, yielded, and the tower and all came crashing down in 1573. The nave never was commenced, and the building as it now stands ends with the transepts.

All views, all recollections of Beauvais are dominated by this building, so vast even in its incompleteness, so singularly satisfactory, though flamboyant, achieving an immense height without the lean and spiky appearance that so often accompanies it, and skilfully preserving everywhere the scale set by the entrance doors and the great flight of steps, so unusual a feature in a Gothic church. Nowhere does one lose consciousness of its immensity. The great transepts are splendid examples of flamboyant architecture at its best. In general appearance they are the same, but the south one is the richer and finer of the two, skilfully designed in receding planes. The great window forms the chief feature, its flowing tracery properly filling the circle without creating awkward shapes and angles, as at Amiens and Rouen. The depth of the two planes of tracery and the huge covering arch have more than a little to do with its splendid appearance.

The transept is flanked by octagonal turrets, which only slightly diminish until they reach the gable, where they terminate in little pavilions, Renaissance in detail and outline, but perfectly harmonious and appropriate in appearance. The whole composition evidences an extraordinary agility in design, and represents one of the most truly impressive and great achievements of any time. Whether regarded as architecture or engineering, it is a never-ceasing wonder, a triumph in each field, an everlasting glory to the town that built it.

EU.

Eu, locally known as La Ville d'Eu, is near Dieppe, and, although little known, possesses much of real interest. Our illustration shows the apsidal termination to the fine church, the nave of which is one of the earliest Gothic monuments in Normandy. It was probably commenced about 1186, after the death here of St. Lawrence, Archbishop of Dublin, while travelling in France. It was probably finished about 1227. The exterior of the nave, eleven bays long, is severely simple. The interior is an unusually pure example of early Gothic, with a nave arcade of a design only found in one other church in France, viz., Rouen Cathedral. It has two rows of superposed arches opening into the aisle.

The choir and chevet are later additions in the flamboyant style.

PICQUIGNY.

Picquigny, a few miles from Amiens, has a church which is a medley of architectural fragments of the thirteenth, fourteenth, fifteenth, and sixteenth centuries. It has a slated spire and fine tower, with angle buttresses treated in a bold and interesting manner. On the north the tower is well led up to by a low transept and turret. The exterior of the nave is very plain; on its north side is a pretty little Renaissance doorway, with circular pediment and sloping tiled roof over, which gives it an oddly humble appearance. The west door has also pilasters and a cornice. The interior is of little interest. There is an unvaulted twelfth-century transept.

There is also a ruined castle of great interest at Picquigny.

Wren's Churches.

WE give reproductions of plates from "The Churches of Sir Christopher Wren," by J. Clayton, published by Messrs. Longmans, Green, Brown, & Longmans, which we give by the courtesy of Messrs. Longmans, Green, & Co. They illustrate St. Mary Abchurch, which we described in our New Year's number, St. Margaret Pattens, notes on which will be found on page 211, and St. George, Botolph-lane, one of the smallest of Wren's churches, now demolished.

The Work of the Modern Indian Master Builder.

WE illustrate two examples of the modern Indian master builder, reproduced from "Indian Architecture," by Mr. E. B. Havell, by permission of Messrs. John Murray. We allude to them in our leading article.

Indian Official Architecture.

THESE four illustrations of buildings recently erected by the Public Works Department are taken from the annual Report of Architectural Work in India for 1914–15. We allude to them in our leading article.

◆

MEETINGS.

FRIDAY, MARCH 17.

Institution of Mechanical Engineers.—General meeting. 8 p.m.

MONDAY, MARCH 20.

University Extension Lecture (*at the Victoria and Albert Museum*).—Mr. Banister Fletcher on "Georgian Town and Country Houses." 4.30 p.m.

TUESDAY, MARCH 21.

Institution of Civil Engineers.—Sir George Cunningham Buchanan, C.I.E., M.Inst.C.E., on "The Rangoon River—Training Works." 5.30 p.m.

WEDNESDAY, MARCH 22.

Carpenters' Company.—Mr. H. Hughes-Stanton on "Landscape Painting." 7.45 p.m.

Royal Society of Arts.—Rev. P. H. Ditchfield, M.A., F.S.A., on "The England of Shakespeare." 4.30 p.m.

THURSDAY, MARCH 23.

University Extension Lecture (*at the British Museum*).—Mr. Banister Fletcher on "S. Sophia, Constantinople." 4.30 p.m.

FIFTY YEARS AGO.

Sanitary Matters.

Sunderland.—The Sanitary Committee c the Corporation, dissatisfied with the Repo of the guardians' medical deputation, as t the prevalence of fever in the parish, hav themselves appointed another deputation c medical men, as well as a Committee, t examine fully, and report upon the causes.

Gateshead.—Typhus still lingers in Gate head, not merely confining itself to th houses of the poorer classes, but sometim making its appearance in the houses of th more wealthy of the population. A corre spondent of the *Gateshead Observer* stat that he heard numerous complaints again the Corporation for not emptying ashpits an middens when requested.

Manchester.—Fever is on the increa here, the weekly number of new cas having risen from 122 to 135, of whic fifteen terminated fatally.

[*** From the *Builder* of March 1 1866.—ED.]

CORRESPONDENCE.

Employment of Discharged Sailors and Soldier

SIR,—In view of the urgent nation importance of the employment of the discharg sailor and soldier, may I ask you to dra special attention to the meeting to consid their settlement upon the land ?

This Association has prepared a speci Report on the Departmental Committe Report on the subject, and this will be d cussed at the meeting at the Mansion Hou on March 22 at 3 p.m., the Lord Mayor presidin Lord Selborne, the President of the Board Agriculture, will speak, and most of the societi interested, both in the welfare of sailors a soldiers and in the development of ru England, will be represented.

I shall be pleased to send cards of invitati to any of your readers applying for them.

EWART G. CULPIN,
Secretary.
The Garden Cities
and Town Planning Association,
3, *Gray's Inn-place,*
Gray's Inn, London, W.C

◆

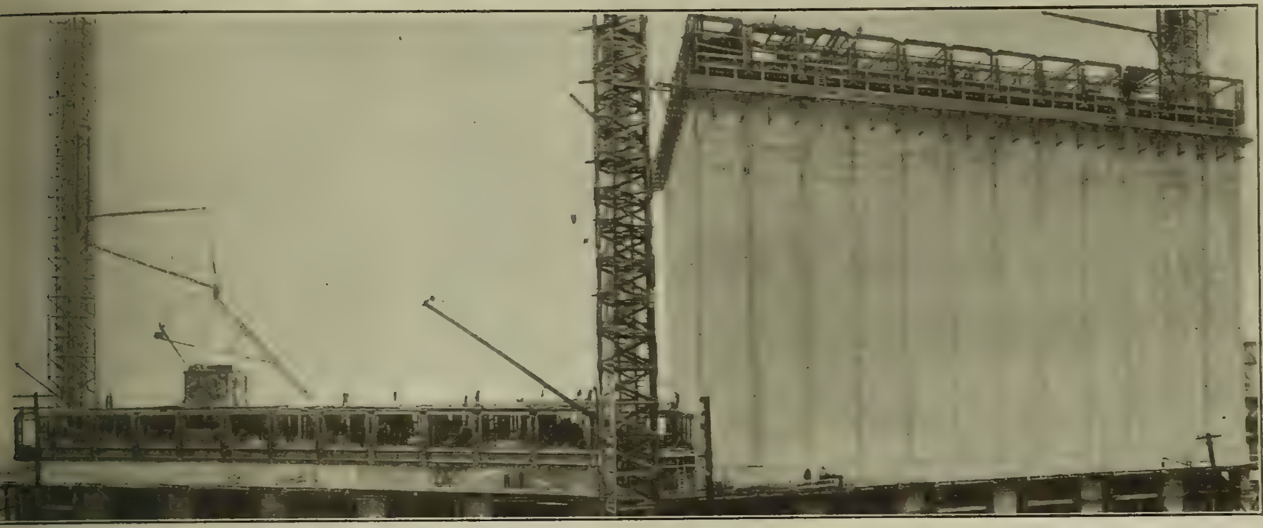
PRIMITIVE METHODIST CHURCH AND SCHOO SALISBURY.

The foundation-stones of the church w laid on March 8. The church will accommoda over 400 persons, and is of late Gothic desi freely treated. Externally the buildings a faced with Southwater red facing bricks, t dressings being of Bath stone. The contract for the first section—church, tower, and spi and vestries—is let to Mr. J. Nichol, Southampton, and the amount is £3,4 exclusive of seating, and the buildings a being carried out from the designs and unc the superintendence of Messrs. George Baines Son, architects, 5, Clement's Inn, Stra London, W.C., and Leeds.

TECHNICAL COLLEGE, CARDIFF.

The new Technical College in Cathays Pa Cardiff, has just been opened. The total c of the College will be nearly £62,000 when is fully complete. The building is in the fo of three sides of a square, the fourth bei reserved for future extension when necessa Two rows of workshops, top-lighted, ha been erected in the area between the north a south wings and parallel to them, while t assembly and examination hall, which centrally situated and has a seating capaci of 400, connect them. Large workshop acco modation has been set apart for the buildi and engineering trades. Altogether fifty lectu rooms, workshops, and laboratories have be provided. The architects are Messrs. I Jones & Percy Thomas, Mr. J. E. Turner, Messrs. E. Turner & Sons, the contractor.

CONSTRUCTION SECTION.



Harbour Elevator, Montreal, Quebec, showing forms in first and final positions.

INFORCED CONCRETE GRAIN ELEVATORS FOR AUSTRALIA.

STRALIA has for many years considered
the possibility of handling its grain
from the farmer to the seaboard
at is known as the Bulk System. It
nated that by this system the farmer
ve from £250,000 to £300,000 per
upon his sacks alone. The South
ian Royal Commission on the question
Marketing of Wheat, in their Progress
dated 1908, and their final Report,
909, dealt exhaustively with the question
dling the grain in bulk, which would
ate the erection of a number of grain
s under Government control.

Government of New South Wales has
cided to proceed with a scheme, which
or an expenditure of £2,000,000, and
ave entrusted the designing of these
rs to the John S. Metcalf Company, Ltd.,
ll also, by the terms of their agreement,
superintending engineers. The prepara-
plans and specifications is already in
s, and the actual building is expected
t about July this year. The scheme
only to New South Wales, but it is
d that similar schemes will be carried
South Australia, Victoria, and Western
ia.

South Australian Government, before
a contract for the actual designing
n elevators, decided to have a report
on the possibilities of handling the
y the Bulk System, and engaged the
Company to draw up this Report. The
as started early in 1915, and completed
January, 1916, when it was submitted to
vernment.

Report calls for :—

-four Country Elevators, capacity 40,000
, at £3,205 each.
y-four Country Elevators, capacity
bushels, at £3,720 each.
ty-two Country Elevators, capacity
bushels, at £4,105 each.
Terminal Elevators :—
rt Lincoln, 420,000 bushels, at £108,320.
rt Pirie, 620,000 bushels, at £121,580.
allaroo, 620,000 bushels, at £143,460.
uter Harbour, 820,000 bushels, at
5.

cost of the elevators will be decided by
; the costs given are the approximations
ed in the Report. The elevators will be
cted in reinforced concrete.

The same company, we may add, designed, in 1915, the grain elevator now in course of construction for the Armour Grain Company of Chicago, and the accompanying illustrations will give an idea of a modern grain elevator with a capacity of 10,000,000 bushels. It comprises a working house of one million bushels capacity, with facilities for receiving grain at the rate of 360 cars in ten hours, and shipping to cars at the same rate. At the same time, it will be arranged to dry 9,000 bushels of grain and bleach 24,000 bushels of oats in ten hours, besides large clipping and cleaning capacities. There will be a marine tower for receiving from vessels at the rate of 20,000 bushels per hour, and a river house equipped to ship to boats at the rate of 120,000 bushels of grain per hour, and with a shipping gallery to carry grain out along the wharf for trimming the vessels after they have received the bulk of their load at the river house. Between the working house and the river house there will be a storage house, which will bring the ultimate storage capacity of the plant to approximately 10,000,000 bushels.

All the machinery will be electrically driven, deriving power from a complete independent power plant of 4,700 h.p. Water tube boilers and turbo generators will be used. Complete facilities will be provided for collecting the dust caused by the handling and cleaning of the grain, and for sacking this dust or handling in bulk. An independent office building for convenience of the operators, a welfare building for employees, a shop building, and 1,200 ft. of wharf are also included in the work.

An interesting feature from a construction point of view is the moving forms used in the erection of bin walls in Canada and the U.S., although practically unknown in this country. These moving forms have many advantages over the usual forms of shuttering in concrete work. The success attained in the construction of the harbour elevator No. 1 for the Harbour Commissioners of Montreal will illustrate the speed of erection which can be obtained by this method. The storage bin walls were each 81 ft. to 96 ft. high, or 7,536 yds. of concrete, and took only the equivalent of 232,000 sq. ft. of timber, 1 in. thick, including the scaffolding.

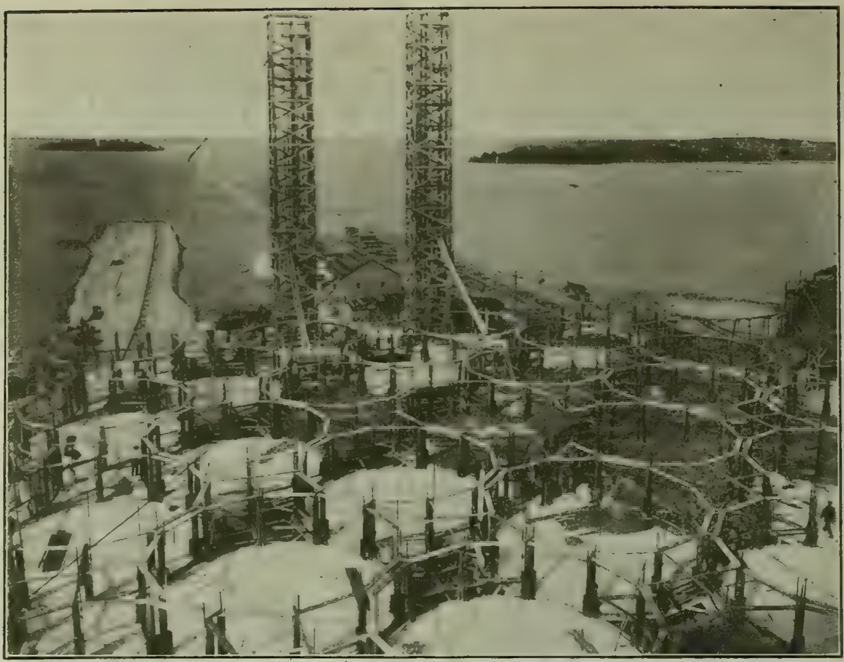
The pouring of the concrete was started on September 3, and on September 10 the walls were 42 ft. 6 in. high, a total of 2,946 yds. of concrete having been placed in these walls in seven days. A further advantage to be claimed for the moving forms is in the finish of the walls; both sides are quite smooth, and the usual unsightly timber marks on shuttered concrete are eliminated. The total wall, 96 ft. 7 in. high, was completed in seventeen days, with an average of 5 ft. 8½ in. per day—this being considered only ordinary progress.

The forms are built of wood, and are like parallel fences 4 ft. high, held apart by yokes to give the thickness of wall required. These 4-ft. fence forms are made and erected for the whole area occupied by the bin walls before any concrete is poured, and the separate form units are yoked and fastened to act as one unit, sometimes as much as an acre in area. As concrete is poured in between the parallel fences the forms themselves are gradually and continuously raised. The space between the forms is covered over to give a level runway for the concrete buggies, so that from above the moving forms look like a big level platform with open slots left where the concrete for the walls is to be poured. Concrete buggies are wheeled about over this platform with as much safety as if they were on the ground.

Amongst the plants designed and in some cases erected by this firm recently are those for the Grand Trunk Railway and the Canadian Pacific Railway on the Georgian Bay, and that for the Port of Montreal are perhaps the most interesting. The company also designed and constructed the first Manchester Ship Canal Elevator, and the No. 2 elevator just completed at No. 9 Dock was also designed by them and erected under their supervision. They are engaged at the present time upon the designs for the silos and grain handling plant for Messrs. Guinness's new brewery at Trafford Park, Manchester.

EXTENSION OF ANCOATS HOSPITAL.

The extensions of the out-patient department of this hospital consist in the erection of two examination-rooms for surgical and medical cases, measuring respectively 20 ft. by 15 ft. and 18 ft. by 15 ft.; a pathological laboratory, and a room in which is installed the cardiographic apparatus recently presented to the institution. There is also a "dark-room." All these rooms are approached by means of a corridor leading from the patients' waiting hall. The five smaller examination-rooms have been remodelled, the roofs reconstructed, and lantern lights inserted. The architect is Mr. W. Cecil Hardisty, F.R.I.B.A., of Manchester.



Reinforced Concrete Grain Elevators: Canadian Pacific Railway Elevator, Port McNicoll, Ontario, showing moving bin forms in position. (*See page* 217.)

THE CONCRETE INSTITUTE.

AT a meeting of the Concrete Institute on the 16th ult. Mr. C. F. Marsh, M.Inst.C.E., Vice-President, read a paper on "Reinforced Concrete as Applied to Waterworks Construction," in the course of which he said:—

"In the construction of works specially required for the purpose of the conveyance and storage of water reinforced concrete can be usefully employed for many purposes. The chief uses for this material are the construction of dams for impounding water, of aqueducts and pipes for its conveyance, and reservoirs and tanks for its storage. There are also many works of an incidental nature for which reinforced concrete may be employed, amongst which are retaining walls, bridges, slope coverings, buildings, fencing, and sundry other structures of various descriptions essential for the completion of any large system of water supply. In this paper only the main uses of the material will be dealt with, as the incidental uses entail its general application to engineering works.

The concrete used for structures, which must resist the pressure of water, should be richer in cement than that used for the generality of structures. For reservoirs, tanks, and dams, where there is sufficient thickness, the concrete should be mixed in the proportions of 1 : 1½ to 3, or 810 lb. of cement to 13½ cubic ft. of sand and 27 cubic ft. of broken stone or shingle, which mixture is sufficiently watertight for any but very considerable heads, but for pipes and structures of small thickness, say, less than 3 in., a mortar mixed in the proportions of 1 to 1½, or 1,620 lb. of cement to 27 cubic ft. of sand, should be used. This mixture is, of course, no more resistant to water pressure than a 1 : 1½ to 3 concrete, but in a thin structure there is a danger in the use of stone or shingle, since two pieces may possibly come together, and any failure in the proper consolidation of the concrete may leave a plane of leakage through the concrete. The size of the broken stone or shingle should not exceed such as will pass through a ¾-in. square-meshed sieve, and may with advantage be ½-in. gauge. It is not advisable to use a richer mixture, as rich mixtures shrink more when drying and expand more when wet than leaner mixtures, and consequently cracks are more likely to be induced; while it has been proved conclusively that with proper care in mixing and placing a mixture in the proportions of 1 to 1½ to 3 is practically impervious under considerable heads. For pipes under pressures exceeding about 40 ft. special linings should be used, such as the sheet-steel tubing in a Bonna pipe or other suitable layer of impervious material.

For any structure which has to resist the percolation of liquids it is advisable, in my opinion, to mix some waterproofing compound with the concrete, or to otherwise provide against leakage by the use of a soap and alum wash, paraffin wax, or other protective coating.

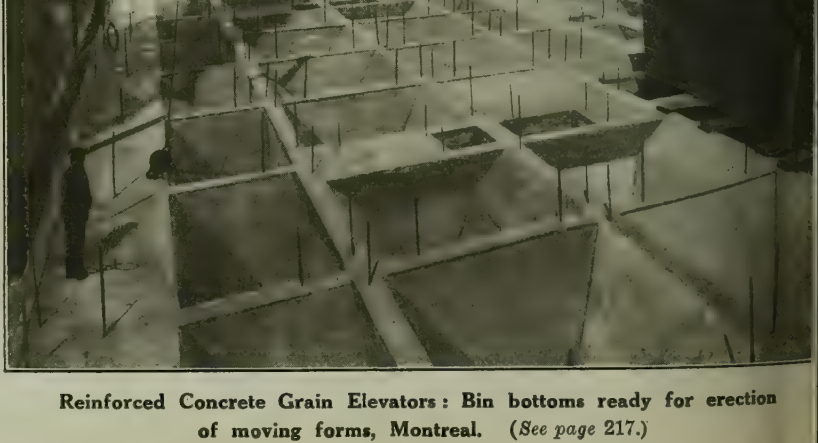
For increasing the imperviousness of concrete or mortar ordinary hydrated lime has been used very successfully and appears just as effective as any of the patent compounds on the market. It can be used in proportions up to 10 per cent. of the weight of cement without injuriously affecting the strength of the mixture, but 5 per cent. is sufficient for any ordinary purpose. The concrete should always be kept damp for some time after moulding, depending on the richness of the mixture. The period in the case of a 1 : 1½ : 3 mixture should be about four weeks.

In structures of considerable length, which may be alternately wet and dry and are exp
to the variations of temperature, it is advis
to provide against cracking, which is al
certain to occur. Such structure should
specially constructed contraction joints
more thant 30 ft. apart, leakage being preve
at the joints by the insertion of sheet lea
copper baffles extending well into the con
on each side of the joint and bent over at
extremities to form a good key. In the
struction of all structures to resist the pre
of liquids, special care is necessary to pro
adequate reinforcement against shrinkage
to the setting of the concrete, fall of tempera
and excessive dryness.

Dams for impounding water have not
constructed of reinforced concrete in
country to any extent up to the present
but there have been many cases in Am
where this material has been used for such d
When reinforced concrete is employed for
construction of dams they are usually of a h
form of construction, having up-stream
down-stream slabs, supported on cross
carried upon a foundation slab. From
foundation slab a core wall must be ca
down under the bottom of the up-stream
and extended well into a watertight stra
The provision of an adequate cut-off wa
most essential, as some of the dams alr
constructed of this material have failed o
to the neglect of this precaution. The
stream slab is generally constructed wi
flat slope not steeper than 1 to 1, since
flatter the slope the more uniform is the pre
on the base.

With a dam of this type, as the rese
fills, the line of resultant pressure on the
will at first become farther and farthe
stream from the centre of pressure on the
with the reservoir empty. When the rese
has filled for a certain proportion of its d
depending on the slope of the up-stream slab
line of resultant pressure on the base m
back towards the centre until under the lim
flood conditions it will generally be foun
be slightly on the down-stream side of
centre of pressure on the base with the rese
empty. The resultant pressure will in no
move very far from the centre of the base,
consequently the intensity of pressure
never vary greatly between the up-stream
down-stream extremities of the base.

Perhaps one of the most economical us
reinforced concrete is in the constructio
elevated tanks, of which there are n
examples in existence. With care and
in the design these structures may be
quite picturesque features of the lands
and are in any case less objectionable



Reinforced Concrete Grain Elevators: Bin bottoms ready for erection of moving forms, Montreal. (*See page* 217.)

ed steel tanks on framed supports. A rced concrete tank can be constructed eost of from 40 to 50 per cent. that of a formed of riveted steel plates, and they n general be less expensive than tanks ssed steel or cast-iron plates.

en designing circular reinforced concrete it is, in my opinion, advisable to limit orking resistance of the steel to 12,000 lb. quare inch, since, although the tensile nce of the concrete is neglected, the tion of the steel bars must induce elonga- the concrete, and a higher stress in the will in all probability cause the concrete ck. It is also, in my opinion, advisable rt two series of circular rings in the walls tank, one near each surface, in place of ries at the centre of the thickness. One as occurred to my knowledge, and there have been others, where the concrete e the central series of hoops broke away used the failure of the structure. It must membered that whereas the interior of nk is kept at a fairly constant state of re and temperature the outside is exposed variations in temperature and humidity, onsequently the two surfaces are under ifferent conditions affecting the expansion ntraction of the concrete.

the construction of reservoirs of this the question as to the economy or other- resulting from the use of reinforced te should receive careful consideration its employment is decided upon. The d of design, if this material is decided will also require careful consideration. ny cases it is not economical, in my n, to use reinforced concrete for the walls or, but it is almost universally an nical material for roof construction.

considerable portion of the depth is below the form of retaining wall construction, bottom slab at the back tied to the front y ribs, is not an economical form of uction, as the excavations have to be erably enlarged to accommodate the slab. A wall designed as a cantilever, ted from the floor of the reservoir, will the excavation, but great care is necessary vide ample support at the bottom to prevent failure between the base of the wall and the floor when the reservoir is empty.

If the reservoir is covered and the covering can be constructed before an excessive loading is brought upon the walls, the roof beams and similar beams formed in the floor can be constructed to support beams along the top and bottom of the wall; which in their turn support the ends of vertical beams between which the walls of the reservoir can be constructed as slabs with horizontal reinforcements.

The covering usually adopted for reservoirs is of the beam and slab type, similar to ordinary floors, and supported by columns, but small circular reservoirs may be covered with a flat dome in a similar manner to that frequently employed for elevated tanks.

Reinforced concrete is a suitable material for elevated aqueducts, a notable example being the aqueduct used to convey water from the Rhone to the Simplon Tunnel works, which was designed and constructed by M. Hennebique and is illustrated in "Reinforced Concrete" by Marsh and Dunn. This aqueduct was nearly two miles long with a fall of 1 in 830 It was of box section about 6 ft. 3 in. by 6 ft. 3 in., and the side walls were about 4 in. thick, the floor about 4 in. at the sides, increasing to about 6 in. at the centre, and the roof about 3½ in. at the sides and 4¾ in. at the centre. The aqueduct was supported on reinforced concrete columns varying from 13 ft. to 19½ ft. in height and placed about 16 ft. 6 in. centre to centre. Expansion joints were left over each support, with a sheet of flexible metal embedded near the outside. These joints were filled in after the first contraction of the concrete.

Open aqueducts built almost entirely above ground-level and those for carrying water over valleys may, with economy, be constructed of reinforced concrete, but for those constructed mainly below ground-level this material will not be so economical for the same reasons as given in the case of reservoirs.

Pipes under small heads, say, up to about 40 ft., may be constructed of reinforced concrete without any special impervious material being embedded in the thickness.

For heads over about 40 ft. some special impervious layer is, in my opinion, necessary. The well-known Bonna pipe is a good example of this type of construction. The impervious layer is formed by a thin sheet steel tube with longitudinal welds formed by the oxy-acetylene or electric processes. This tube is embedded in the thickness of the concrete with the reinforcement outside for smaller heads and inside and outside for greater heads."

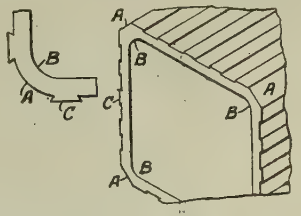
HOUSES IN NORTHUMBERLAND.

We illustrate three well-planned houses, designed by Mr. Edward Cratney, which show the increasing influence of axial planning applied to a type of work which has long been distinguished by the absence of symmetry. The house at Stocksfield for Mr. H. Dillon Bennett has been built; the building of the other houses is for the time in abeyance.

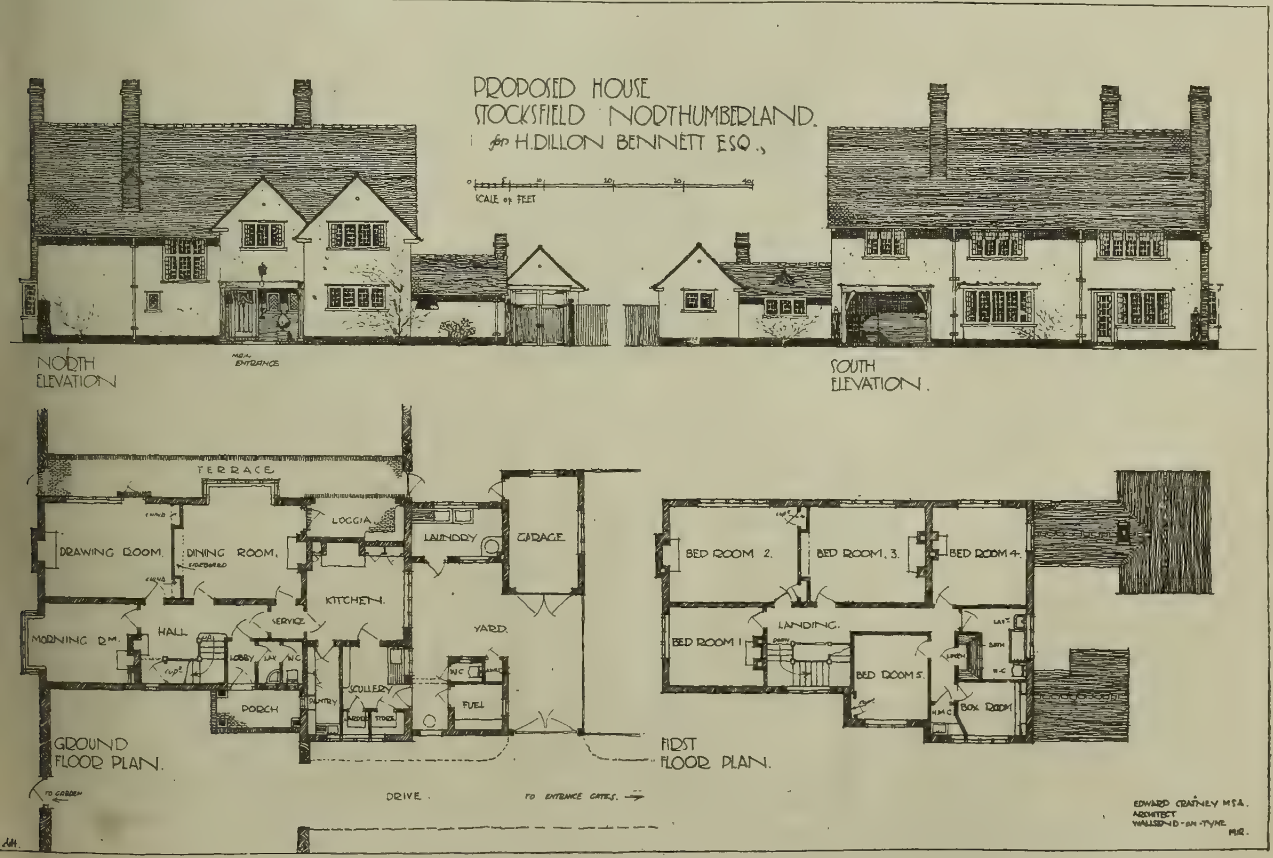
SELECTED PATENT.

☞ 20,745 of 1914.—George Leslie Allen: Blocks for floors.

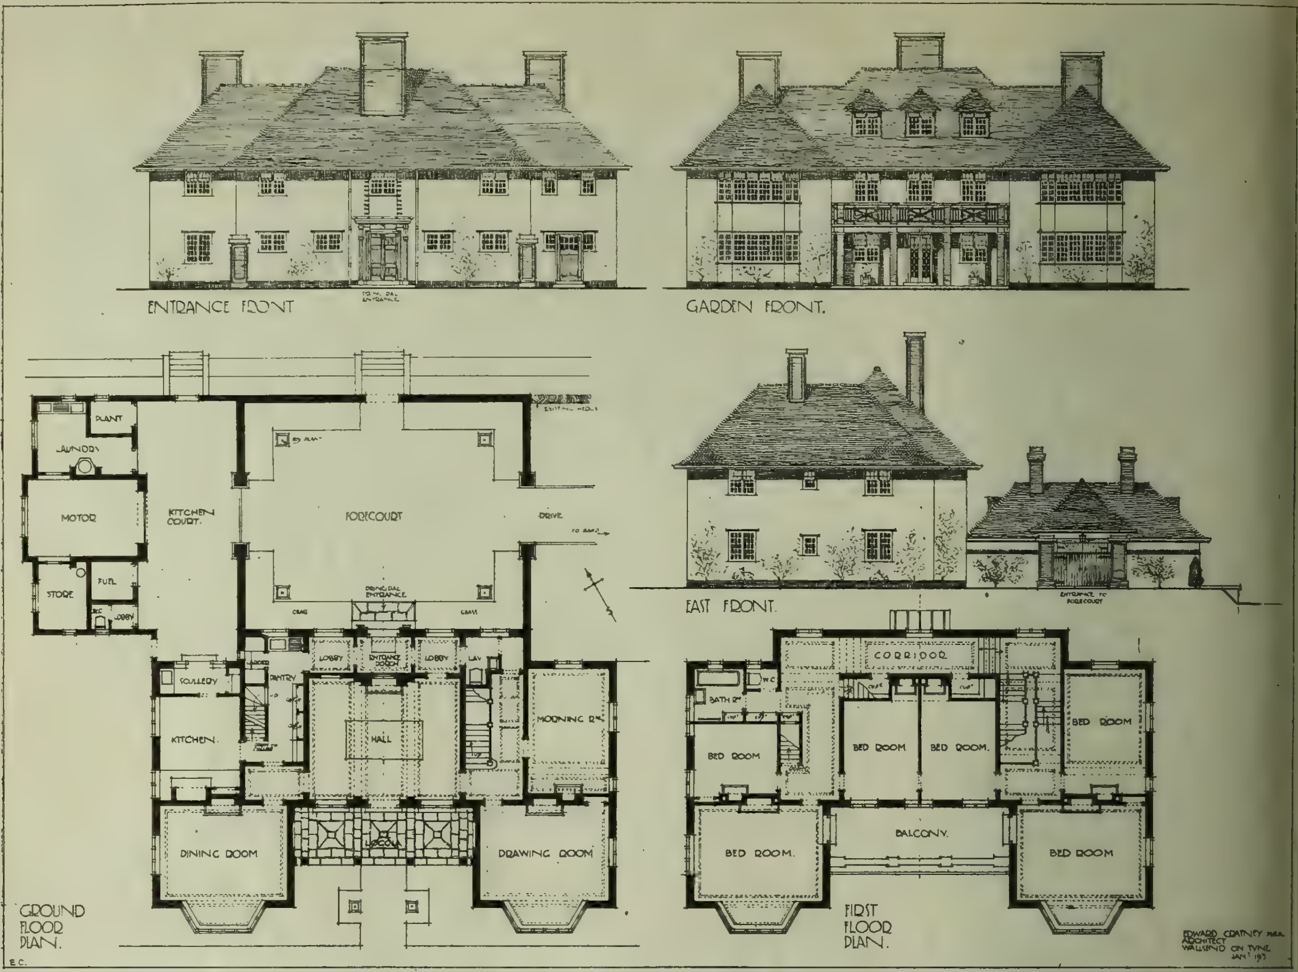
This relates to hollow filling blocks, for concrete and like floors, formed with bevelled corners A to provide an adequate bulk of material at the junctions of the vertical and horizontal layers of concrete and also to facilitate the attachment of electric or like fittings. The corners may be straight or rounded, and the interior corners B are curved. The external surfaces of the blocks are formed with longitudinal strips C with undercut edges.



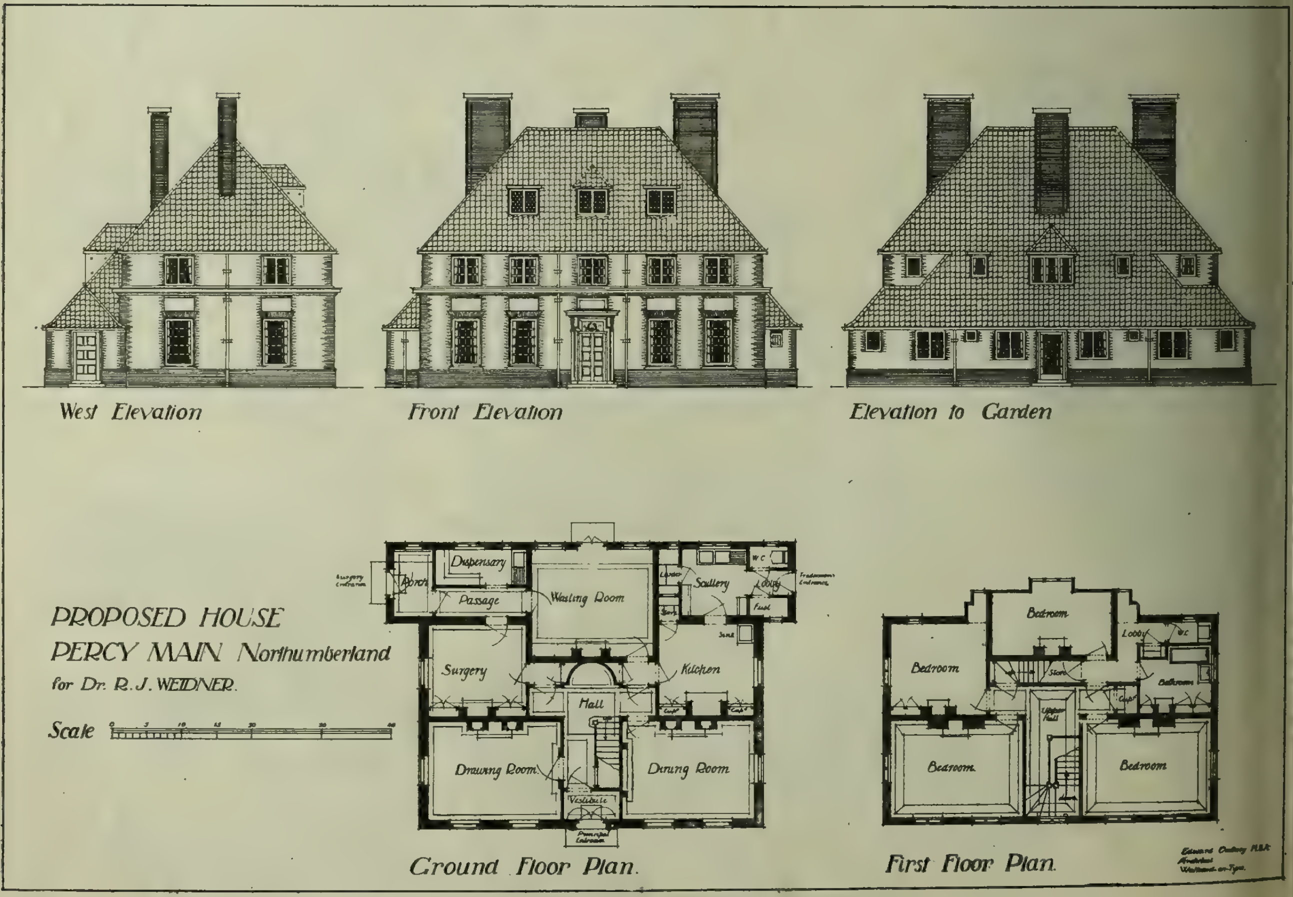
20,745 of 1914.



Mr. Edward Cratney, M.S.A., Architect.



Proposed House, Stocksfield, Northumberland.
Mr. Edward Cratney, M.S.A., Architect.



Mr. Edward Cratney, M.S.A., Architect. (*See page* 219.)

THE BUILDING TRADE.

LUMP SUM CONTRACTS.

T is satisfactory to have a decision of the Court of Appeal on a question which must be of everyday occurrence, but the law as hich has to be gleaned from a series of old . In the case of Dakin & Co., Ltd., *v.* Lee, ne Law Reports for March, but which reported some months ago in the *Builder*, the tiffs, builders, had undertaken to do certain rs to the defendant's house for a lump and they were suing for a balance of unt. The defendant's contention was that vork had not been completed, and therefore r the lump sum contract nothing was ble. Part of the plaintiff's claim related dditional work and extras, but it is not ssary to consider anything but the lump contract, as the appeal related only to aw in connection with that.

ne Official Referee had found that the work red to in the specification had not been ed out in three particulars:—(1) The rete to be placed under part of a side wall h was to be under-pinned was placed to a h of 2 ft. instead of 4 ft. It may here be d that the depth was not stated in the fication, but only in a letter, and the Court ppeal expressed some doubt as to whether was in fact an express contract as to but the case was treated on this basis; olumns to support a bay window were of w iron 5 in. in diameter instead of solid 4 in. in diameter; (3) the joints over the window had not been bolted together as fied, and the concrete was not properly ed.

may be said at once that the Court of eal considered these omissions to be due egligence and bad workmanship, probably g to the carelessness of some workman or foreman, and not a deliberate omission the specification. The Divisional Court carefully reviewed all the authorities, and Justice Sankey thus summarised the law:—here a builder has supplied work and labour the erection or repair of a house under a sum contract, but has departed from the s of the contract, he is entitled to recover his services unless (1) the work that he has has been of no benefit to the owner; the work he has done is entirely different the work which he has contracted to do; 3) he has abandoned the work and left it nished."

he Court of Appeal affirmed this decision ne Divisional Court, but apparently mainly essed itself to the point that there had been abandonment of the contract, and they ed the judgment in one particular; for reas the court below had arrived at the wance to be made to the building owner n informal manner, the Court of Appeal rred the case back to the Referee to ascertain t sum should be allowed in respect of the ctive work.

he principle to be applied was laid down Thornton *v.* Place (1 Moo. & R. 218), a case re work had not been done in accordance a specification, by Baron Parke as follows:—hen a party engages to do certain work on ain specified terms and in a specified ner, but in fact does not perform the work s to correspond with the specification, he is, course, not entitled to recover the price ed upon in the specification; nor can he ver according to the actual value of the k, as if there had been no special contract; at the plaintiff is entitled to recover is the e agreed upon in the specification subject deduction; and the measure of that deduc- is the sum which it would take to alter work so as to make it correspond with the ification."

he Court of Appeal referred the case back the Official Referee to be dealt with on the nciples laid down in this case. We do think it necessary to detail the cases which e reviewed by the courts, but we may point out that one case which is to be found in the text-books, Ellis *v.* Hamlen (3 Taunt. 52) was overruled as being inconsistent with the other cases and with the principles now laid down.

The reason for the adoption of some such principles in relation to building contracts is easy to explain, for where work has to be done on another man's property it is not like the case of a chattel which can be examined and rejected if it is not made as ordered, but by a gradual process becomes a part of the property and must be accepted in a sense by the owner of the property. Therefore in ordinary cases the first of the tests set out in this case covers the main point to be ascertained, viz., has the building owner derived benefit from the work done?

The second test, however, must qualify this, as the work must be of the nature of that contracted for, for a building owner might be said to derive benefit from work done to his house although it was not of the nature he had contemplated.

In the course of the argument the case was put of a builder who contracts to erect a wall 10 ft. high, but in fact only erected one 2 ft. high. The building owner might be said to derive some benefit in such a case, but Mr. Justice Sankey said that this would come under the third head mentioned, *i.e.*, an abandonment of the contract.

We think that the tests provided in the judgments in this case will be found to provide valuable guides to contractors and those contracting with them, and if careful consideration is given to them they will be found to apply to nearly every case likely to arise in practice.

NEW GOVERNMENT CONTRACTS.

War Office.

Barrows.—Baltic Saw Mills Company, Ltd., Goods Station-road, Tunbridge Wells; J. Christopher & Sons, Ltd., St. John's-lane, Clerkenwell, E.C.; C. R. PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The Plans Committee of the Aberdeen T.C. has passed the following plans:—Temporary shed, Justice Mill-lane, for the Town and County Motor Garage, per Mr. John Ellis, architect, Stonehaven; alterations on dwelling-house in East North-street, for Mr. R. A. Pressly, dentist, per Messrs. D. and J. R. M'Millan; alterations at factory at junction of North Esplanade West and Russell-road, for Messrs. George Mellis & Son, Ltd., per Mr. George B. Mitchell, architect; dwelling-house, Garthdee-road, for Messrs. Richards, Ltd., per Messrs. Wilson & Walker, architects; shed at Esplanade Saw Mills, North Esplanade West, for Messrs. John Bisset & Sons, Ltd., per Messrs. D. & J. R. M'Millan, architects; office and store, Commercial-road, for the Don Fishing Company, Ltd., per Mr. John Cameron, architect. The Street and Roads Committee of the T.C. has had before it a letter from Messrs. Wilson & Walker, architects, transmitting amended plans of the new warehouse proposed to be erected by Messrs. Richards, Ltd., in Kingsland-place.

Aldershot.—The D.C. has received plans for proposed buildings on a site acquired in the Avenue by the Army and Navy Stores.

Allendale.—The P.C. has approved plans of proposed semi-detached houses and shop to be built on the Allen View Estate.

Barcelona.—The *Gaceta* of February 27 notifies that tenders will be received by the Municipality of Barcelona, within a period of thirty days from that date, for the carrying out of street drainage and sewerage works in that city. The total estimated cost of the works is 131,651 pesetas (about £5,270).

Barrow.—The T.C. has agreed to a proposal of the General Purposes Committee to erect a number of houses for Corporation employees.

Belfast.—The Belfast Harbour Commissioners have accepted the tender of Messrs. H. & J. Martin, Ltd., for the erection of the proposed new shed at the Dufferin Dock.

Birmingham.—The Birmingham Tame and Rea District Drainage Board are making application to the L.G.B. for sanction to a loan of £1,200 for the extension of the Board's electric transmission installation at the sewage farm.

Bournemouth.—The L.G.B. has approved plans of the new pavilion to be erected at Bournemouth by the T.C. The scheme, estimated to cost over £50,000, will not be proceeded with until after the war.

Broadstairs and St. Peters.—The D.C. has approved plans of alterations to the Railway Hotel Stables, for Messrs. Tomson & Wotton.

Burnley.—The Improvement Committee of the T.C. has had before it a plan submitted by Messrs. John Knape & Son, Ltd., for the erection of a garage in Canning-street.

Buxton.—The U.D.C. has approved the following plans:—Addition at rear of Park Lodge; garage for Mrs. C. Swain, "Avenham," College-road; alterations at the Grove Hotel for Messrs. Allsopps, Ltd.

Chile.—Messrs. Gibbs & Co. have been granted permission to construct a wharf at the port of Mejillones for the loading and unloading of nitrate and coal. The *Diario* of December 22 last publishes a law authorising the Chilean Government to contract loans with banks in Santiago up to the amount of 1,500,000 pesos (about £51,500) for the execution of street paving works in that city.

Croydon.—Plans passed by the B.C.:—Mr. W. Darnell, 63, Fernside-road, Balham, fifteen houses, Headcorn-road; Messrs. Paish, Tyler, & Crump, 1, Addiscombe-road, four houses, Addiscombe-road; Mr H. G. Lumsden, 39, Crowther-road, five houses, Alfred-road.

Dewsbury.—The Electricity and Tramways Committee of the T.C. has accepted a contract for the erection of an engine-room. The National Electric Construction Company are to reinstate the buildings in the Market-place which were wrecked by a runaway tramcar some time ago.

Dundee.—Plans passed by the T.C.:—Brook-street, Broughty Ferry, alterations on dwelling-house for Mr. Robert Baxter; Byron-street, stables and temporary store for Messrs. Francis Stevenson & Sons; Meadow-street, alterations on and additions to offices for Messrs. Samson & Unna; South Baffin-street, store for Messrs. A. G. Kidd & Son, Ltd.; new streets, Maule-street and Navarre-street, Barnhill, extension of for the Earl of Dalhousie.

Dunfermline.—The Dunfermline Dean of Guild Court has passed plans by the Scottish National Council of the Y.M.C.A. for the extension of the Rosyth Hut. The extension is to consist of dressing and bathroom accommodation, hairdressing saloon, and lavatory provision.

Elgin.—Plans passed by the T.C.:—Motor garage proposed to be erected by Mr. Donald Mustard in Duff-avenue, and alterations of shop front proposed to be carried out by Miss Hay at 21, South-street.

Fylde.—Plans passed by the R.D.C.:—Mr. Popplestone, two houses, St. Anne's-road, Marton; Mr. W. Rigby, house and farm buildings at Higher-road, Freckleton; Fylde Industrial Cooperative Society, boiler house, Weeton-road, Wes am, Mr. John Kirkham; stable and piggeries, Bryning-lane, Wrea Green, Mr. A. Jackson; stable and piggeries, Preston Old-road, Marton.

Glasgow.—The Savoy Theatre, Glasgow, recently bought up by the Bicolor Syndicate, of London, is to be remodelled and made into a picture house. At a meeting of the Glasgow School Board it was moved that immediate steps be taken to provide classes for children of school age having defective sight and myopia, the school to be as centrally situated as possible. It was agreed to remit the motion to the joint consideration of the Special Schools and Medical Inspection Committees. The Shipowners' and Dock Labour Employers' Organisation has agreed to provide a dry canteen at Prince's Dock and one at Rothesay Dock.

Grantham.—The T.C. has approved plans of new workshop at Earlesfield Works, for Messrs. A. & J. Shaw, and additions to Nos. 29, 30, and 31, Manners-street, for Mr. T. M. Lawson.

Hammersmith.—The B.G. have been considering the question of structural alterations at the Infirmary.

Hartlepool.—The T.C. has approved the following plans:—Mr. J. T. Graham, rebuilding house, Victoria-place; Mr. R. Hopper, conversion of Ocean House, Moor-terrace, into two dwelling-houses.

Haywood.—The T.C. has passed the following plan:—Messrs. Wm. Wild, Ltd., new
Millers' Brook, Miller-street.

Lucan.—A fund is being raised to carry
extensions and repairs to the convent premi

Marsden.—The D.C. has passed plans
alterations at the Marsden Picture Palace.

Nelson.—The T.C. has approved the follo
plans:—For the Bridge Mill Company,
heald and reed store, Bridge Mill; for Mr
Aspin, bedroom, storeroom, etc., 7, Hendon-r

Newhaven.—At a recent meeting of the R.
the Surveyor submitted plans for the erectic
an estate office at New Anzac-on-Sea, and t
were passed. An estimate was received from
Petitt, of Rottingdean, of £18, for demolis
and clearing away Cliffe House, Rottingd
This was accepted.

Otley.—The L.G.B. held an inquiry into
town-planning scheme of the Otley Dis
Council.

Ramsgate.—The T.C. has approved plans
the erection of a bungalow in Pysons-r
owner, Mr. G. Griggs; and for the erectio
a private garage at Mr. Bryant's, in Shaftesb
street.

Rowley Regis.—It is proposed to convert
premises lately occupied by the Cable A
sories Company, Ltd., at Britannia-street,
dale, into a glue factory.

Selby.—The R.D.C. has appointed a com
tee to consider a town-planning scheme.

Spain.—A new road will shortly be constru
crossing the Sierra Nevada at an altitud
nearly 10,000 ft., and descending into the A
jarras district. The Government has gra
2,000,000 pesetas (about £80,000) for this ur
taking.

Stevenage.—Plans passed by the U.D.C
Plans submitted by Messrs. Shrouder
Matthews of proposed extension of drainag
29, Trinity-road, belonging to the Misses B
proposed additional room at Sishes for
Julius Bertram; plan submitted by Messrs.
Austin & Sons of proposed alterations at
Coach and Horses public-house, belongin
Messrs. E. K. & H. Fordham, Ltd.

Stokesley.—The R.D.C. has approved plans
the conversion of the old Bethel Chape
Stokesley into a farmhouse, and for a stone w
house at Great Ayton for Messrs. Dixon Br

Strood.—The Rochester T.C. has decided
purchase land at Steele-street, Strood, for
erection of workmen's dwellings to take the
of those recently demolished in other parts o
city.

Stroud.—The U.D.C. has approved a
presented by Mr. A. W. England for a c
gated-iron building at the back of his pren
in Lower-street.

West Lancashire.—The West Lancashire C
cil has approved the following plans:—Prop
wash-house, Titmouse Brow, Hesketh Bank,
Mr. T. Butcher; proposed extension of pren
in Coal Pit-lane, Bickerstaffe.

Wigan.—The T.C. has resolved to appr
the L.G.B. with a view to their sanction b
obtained to the immediate erection of par
the houses contained in the Melverley-s
scheme, and that the Town Clerk be autho
to make application for a grant towards
cost of erecting the houses in Melverley-s
and Coop-street.

Wokingham.—The T.C. has received plans
enlargement of the building belonging to
A. J. Priest at the corner of Langborough-
and Luckley-path.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3816. MARCH 24, 1916.

LIVING ART.

A REVIEW of the great architectural periods of history reveals a fact which we believe is frequently lost sight of now, and which partially accounts for the poverty of the architectural results which distinguish the work of the present day. In past the architect, whether in the form of a master son or master craftsman of mediæval times, or in that of the hitects of the early Renaissance period, trained in a *bottega* familiar with the allied arts, both in practice and theory, y be said to have held the view that art was one and ivisible. We cannot imagine the designers of the great rks of mediæval France employing sculpture as an accessory ture; they were rather working, in conjunction with the agers, to create a masterpiece by the means of the common d of skill, which was the heritage of the craftsmen of the day. The mediæval cathedral and the mediæval bridge were e the expression of the greatest engineering knowledge of age; in fact, it is very questionable whether, given stone ne as a means of structure, the most skilful modern engineer ld produce anything more scientific than the vaults and ports of Reims, Amiens, and Beauvais, or more intricate n Henry VII.'s Chapel. The mediæval builders at the mination of the Gothic period, whether we call them master sons, architects, imagers, or sculptors, put the whole owledge and skill of the times into the solution of the blems before them, with the result that the buildings erected pass those of later ages in unity of conception and the ression of power.

The Greeks consciously limited their constructive problems, ich were neither complicated nor difficult; but their architece, divorced from its sculptural accessories, would be incomplete npared with the results which were produced. The Greek nple without its sculptured pediment would never have ressed the world with the sense of matchless perfection ich we admire, nor can there be a doubt that the exponents the two arts worked side by side in absolute co-operation understanding of each other's objects.

In Egyptian architecture it is painting rather than sculpture ich was called to the aid of architecture, but the pages of ampollion show how much the Egyptian painters added to meaning of architecture, and how completely the two arts e interdependent on one another; and in the days of the naissance we see the added effect given to architecture by men who more thoroughly than any other understood the relation and interdependence of the arts. In the case of red Stevens, two of whose drawings we illustrate in this ie, we see how the systematic study of the three arts enabled nan who lived in a nadir of European artistic history to duce a work such as the Wellington Memorial, in which we e the expression of architectural and sculptural art as one ivisible unit, not as accessory additions to one another; ereas now architect and sculptor pursue their ways independently, calling upon each other's help when the essential es of structure are too far advanced to permit the combined ression of art as a whole. So in our bridge building the hitect is eliminated except in a subordinate capacity, in ich he is called in to tone down mistakes which are radicable and which absolutely mar a whole conception. is difficult in the complexity and specialisation of our modern to suggest an adequate remedy. Few of our architects ve the means or the enthusiasm and love for art which can place means to follow in the steps of Stevens and give the st years of their lives, not to gaining connection and clients, but to acquiring such a knowledge of art as a whole as will enable them to deal with its greater problems; nor, it must be added, could many achieve the results produced of a great genius like Stevens; though, on the other hand, we doubt not that if forty architectural students followed in his footsteps year by year the whole history of modern English architecture would be revolutionised.

The other alternative seems to require specialisation in the direction of effort and determination to seek fortune along certain considered lines, and involves the architect whose bent is to undertake the solution of great constructional problems like bridge building, factory and warehouse construction, and railway architecture, associating himself not with another architect but with an engineer. No man can call in and work in perfect harmony with an expert in another calling—which is what satisfactory design necessitates; but if he undertakes his life work in partnership with such a man the two will learn to understand each other's principles and will know exactly where and how they can best employ their joint efforts. In the same way the architect who seeks his fortune in the direction of the solution of monumental design would be immensely aided by working in partnership with a sculptor, a painter, or with both; it is, we feel, in some such manner alone that we can again produce living art. Mr. T. P. Bennett, A.R.I.B.A., has written a useful little book entitled "The Relation of Sculpture to Architecture"* which should serve a useful purpose in calling attention to a very important subject which is little understood. The greater architectural success of modern French work is due not alone to the better education acquired by the average French architect, but also to the recognition that architect and sculptor should understand the principles of each other's arts and work together for a common end. The design of the modern French monument is the result of the closeness of this co-operation, and in many cases they are worthy successors of the great works of the Renaissance; whereas in this country if all the monuments erected during last century could be swept away we should be gainers and not losers on a balance.

But no manuals for the architect can enable him to dispense with the personal co-operation of the sculptor, and it may be suggested that if our students spent a year or a year and a half studying side by side with sculptors in the schools they would fully understand this themselves. It is only the uninitiated and the ignorant who will ever underrate the complexity and intricacy of the problems of another art or imagine that in their own person they can ever be absolute arbiters in matters of æsthetics. The genius of Stevens, stimulated by years of training, enabled him to design and carry out a great monument which belongs to architectural and sculptural art alike; but the training he had would not have enabled him to cope with a practical problem without a further long period of apprenticeship. Our work must always be undertaken with a knowledge that we are handicapped by the short span of human life, that limitation which prevented the genius of Stevens from being of the service it might have been to humanity and art.

Only by co-operation and understanding can we emulate the work of the artists of the past, which was the result of the collective work of artists in different types; only in that way can living art be produced and the sum of beauty increased in spite of the eternal truth of the saying, *Ars longa, vita brevis est.*

---

* "The Relation of Sculpture to Architecture." By T. P. Bennett, A.R.I.B.A. [(Cambridge University Press.)

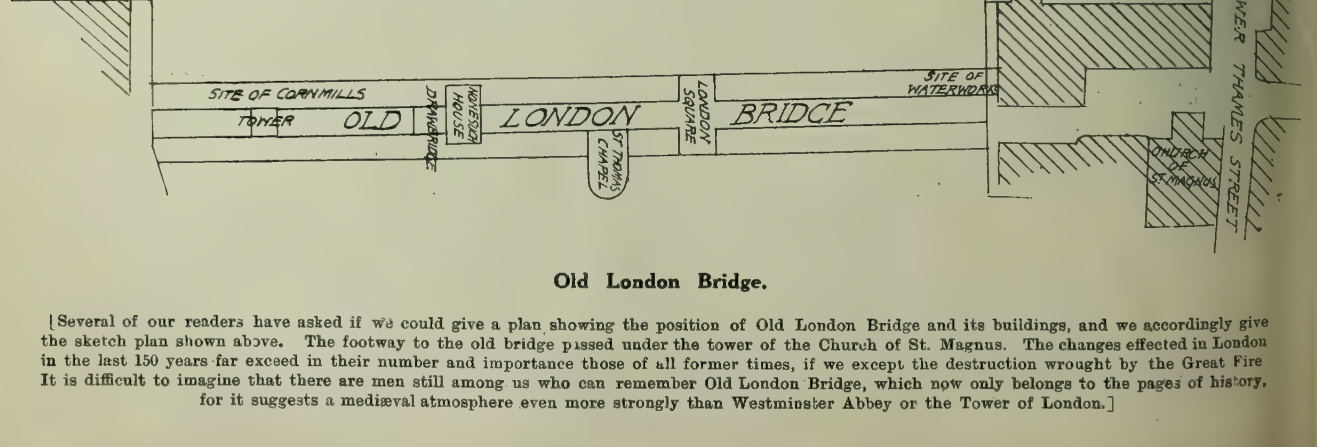
NOTES.

An Act of Justice. THE competition for new Government buildings at Ottawa which Mr. Collcutt assessed some time ago proved abortive, and the labour of the selected architects who have had to compete both in the preliminary and final competitions has been thrown away through the Government's determination not to proceed with the scheme. Seeing that the Canadian Houses of Parliament have been reduced to ashes and must presumably be rebuilt, and that one at least of the competitors must have proved his capacity to design a great scheme, it seems to us that the Canadian Government might in justice appoint the selected competitor for the abandoned Government Offices as architect for the new Parliament Offices. In this manner they would win the appreciation which all feel for fair-dealing and honourable recognition of the just claims of professional men, and we are convinced that the result would be one which would satisfy our kinsmen beyond the seas. The history of competitions in England has included many cases where injustice has been done to professional men, though these cases are, we are glad to record, becoming of rarer occurrence. In the Dominions the system is in an earlier stage of development, and the effect of fair and generous dealing would prove of even greater value.

War and Rent. THE National Housing and Town Planning Council are to consider a Memorandum prepared by their Secretary setting forth the difficulties arising out of the position of the married soldier under the Derby scheme. As we all know, the married man who is called up has in many cases to relinquish work which enables him to pay his way and in military service assume liabilities which his pay and separation allowance can in no way cover. Three cases are given to emphasise the serious nature of the problem—that of a skilled workman, earning 35s. a week, who has invested part of his wages in buying a house on the instalment principle; a young clerk who rents a small house at £22 a year and who finds his salary of £3 a week reduced to £1 1s.; and an architect who by his personal endeavours has been making £400 a year and will find himself in receipt of barely £60 in its place. It is pointed out that any measures taken must be equitable in securing that each case shall be treated on its merit and that the home of each soldier should be regarded as equally worthy of maintenance. It is urged that the term "slacker" will be most applicable to those who do not see that steps are taken to secure justice for those on whom the burden falls. The proposal that the men called up shall be simply relieved of the legal obligations they have incurred does not meet the case, nor does the moratorium proposal if interpreted simply as a close period during which claims cannot be pressed. It is urged that such claims should be paid not by the individual, but by the nation for whom the sacrifice is made, and that it is unfair to leave the question in suspense. The whole subject is a most important one, and the Council should be able to do much service if it can formulate a really workable proposal to obviate injustice.

The Royal Institute of Painters in Water-Colours. THE winter exhibition of the Royal Institute Painters in Water-Colours contains much wo which, though pleasing, is mediocre in quality a commonplace in conception; but, as usual, the are a few pictures of marked and outstandi quality. The finest figure subject is the pictu by Mr. J. Hassall, R.I., entitled "The Red Cushions (No. 464), showing a woman in mediæval costume seated amo cushions. It is a magnificent study of colour, forceful and effecti and at the same time peculiarly soft and liquid in rendering a treatment. Mr. John E. Aitken sends "Veere, Holland," which giv a very clever effect of atmosphere and chiaroscuro, suggestive the old Dutch masters. Another fine picture is the same artist's "O Amsterdam" (No. 433). No. 533, "Kismet," by Mr. Dudley Hard R.I., is a delightful example of strong clear colouring which no o should miss seeing. The exhibition contains a large number of go pictures of architectural subjects, but we should be glad to see so of the commonplace and sentimental renderings of hackneyed subje eliminated from this and other exhibitions; they are a wearine to the flesh and eye, and tend to spoil our enjoyment of the pictu of exceptional merit. It is certain that if four-fifths of the pictu could be weeded out of many of our galleries we should obtain more pleasure and profit from those which remained; but until t few exceptional pictures become "old masters" we shall not s them in favourable environment.

The Friday Club's Exhibition. AT the present time we should be grateful f anything which gives us a little temporary relaxati from depression, and therefore we owe a gre debt of gratitude to those who have brought togeth the amazing collection of artistic eccentriciti which are now on view at the Gallery of the Alpine Club. T perverted ingenuity of a clever child recovering from the effects a severe nightmare, a superb indifference to established cano and to the opinion of normal human beings, must be needed befo any of the painters whose works are exhibited could consent allow them to be shown at all. We can imagine the artists—bo Cubists and Futurists—pleasantly discussing among themselves t extent to which the public can be impressed by their matchle effrontery. Where all is so amusing it is difficult to pick out th which is supremely so; but we may mention Miss Mary Creighton "Bird Tree" (No. 82), in which every bough of what appears to a badly-drawn "monkey-puzzle" is occupied by a brightly-colour bird of no known variety. No. 58, "Dives and Lazarus," by the sa artist, is almost equally quaint, and never, we believe, has a mo poverty-struck Dives been presented; it may serve as an allego to represent that wealth is in reality mere dross. We have a Futuri representation of the "Tomb of Napoleon" by Miss D. E. Bre (No. 98), two delightfully quaint Cubist war pictures by Mr. C. R. Nivenson, a charming study of "Still Life" by the inimitab Mark Gertler (No. 17), and a number of other notable works. W have never seen a farce or read an extravaganza which is mo entertaining, and no one who needs amusement should miss th opportunity of obtaining it by omitting to visit the exhibition.



Old London Bridge.

[Several of our readers have asked if we could give a plan showing the position of Old London Bridge and its buildings, and we accordingly give the sketch plan shown above. The footway to the old bridge passed under the tower of the Church of St. Magnus. The changes effected in London in the last 150 years far exceed in their number and importance those of all former times, if we except the destruction wrought by the Great Fire It is difficult to imagine that there are men still among us who can remember Old London Bridge, which now only belongs to the pages of history, for it suggests a mediæval atmosphere even more strongly than Westminster Abbey or the Tower of London.]

E LONDON CHURCHES)F WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

XXII.—The Pseudo-Gothic Works of Wren.

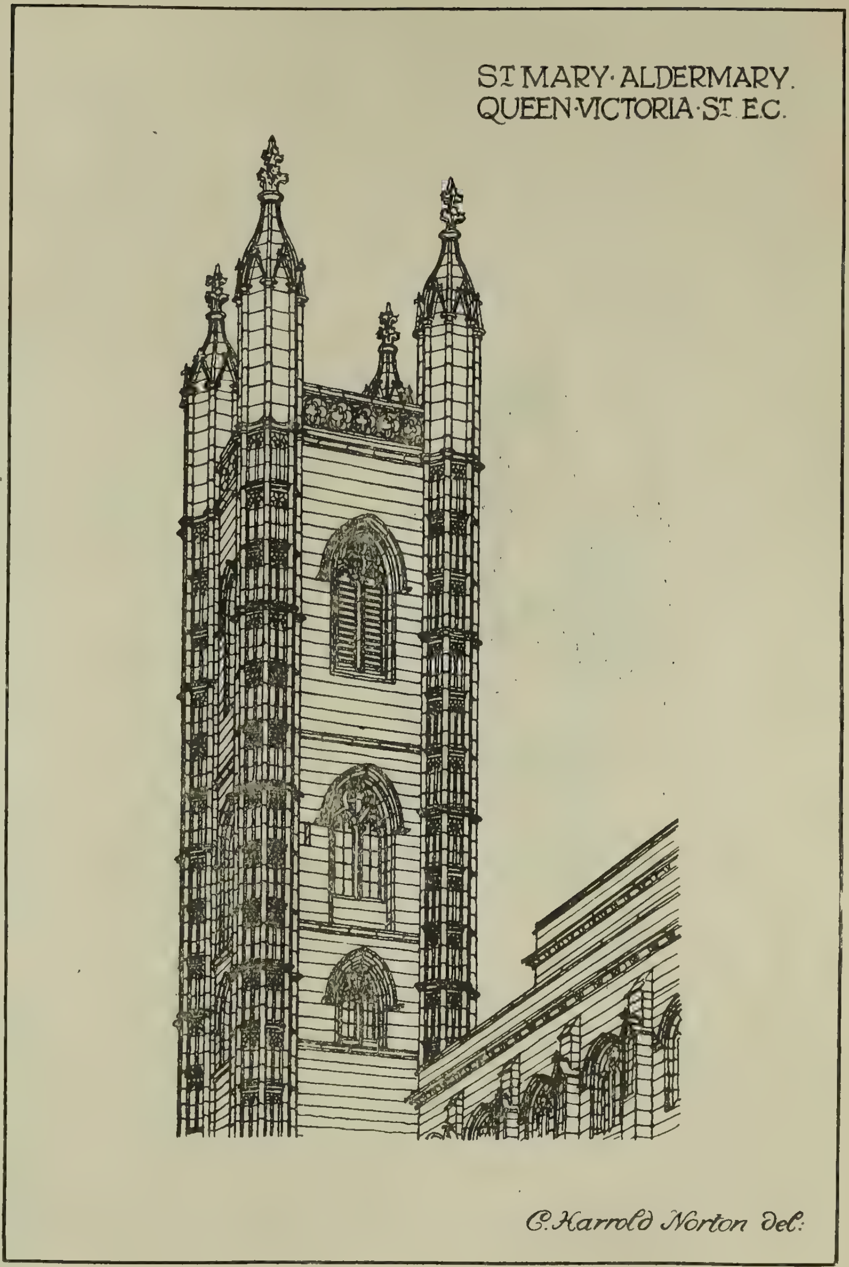
ESIDES the two western towers of West- ter Abbey Wren abandoned a Renaissance ment in three of his churches, completely t. Mary Aldermary, in St. Dunstan-in-the- , and in St. Michael, Cornhill, in respect ne towers of those buildings.

ren's reason for working in a despised has been variously put down to caprice, desire to experiment, and other causes, in the case of St. Mary Aldermary, which rebuilt in 1681–82, a legacy of £5,000 had left by Mr. Henry Rogers for the rebuilding church, and his widow and executrix ented to its being employed on the con- n that the new church should be a copy ne former one. This would amply account he entire church being of a Gothic character. St. Dunstan-in-the-East it seems possible Wren's mechanical and engineering bent interested in the ingenious construc- of the Gothic spires of St. Nicholas, castle, St. Giles, Edinburgh, or King's ge, Old Aberdeen, and determined to n a similar spire. There is also the that he adopted the form of design eference to the wish of his daughter Jane, icturesque if unauthentic legend. This was not completed till 1699, though the of the church, now demolished and replaced he new church built in 1817, was built ty-eight years earlier.

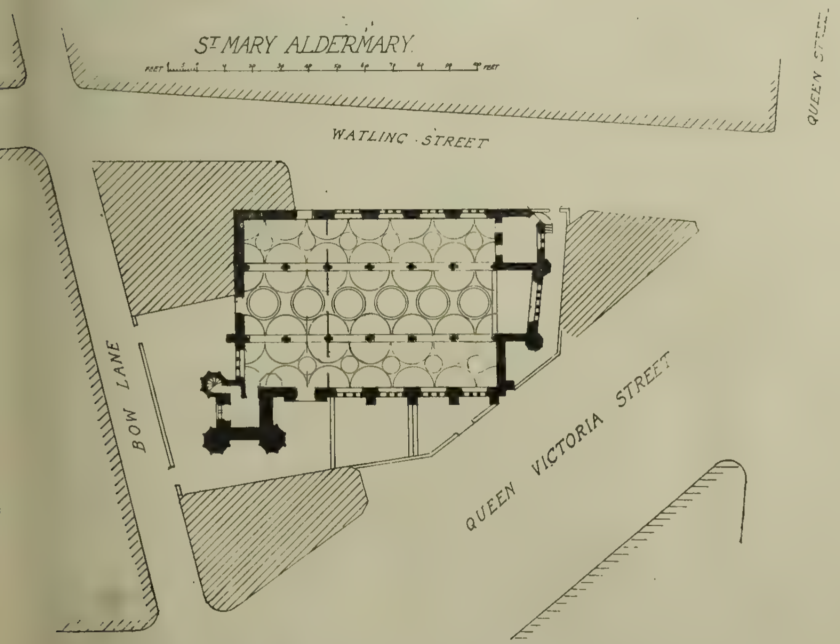
e third "Gothic" design, that of the r of St. Michael, Cornhill, was the last Vren's works, and was designed when he in his ninetieth year, or in the year 1722, after the completion of the church.

we imagine the great architect to have ved the wish of his clients in giving their ch a tower closely resembling that of St. Aldermary, we shall account for the ic character of the three designs without ting an impulse of caprice, which is foreign Vren's character. It is noticeable that oting in the case of St. Mary Aldermary, e he was tied by the testator's wishes, id not follow a Gothic type for the body e church, a further proof that his adoption Gothic type was no mere whim, but was d on him by external circumstances.

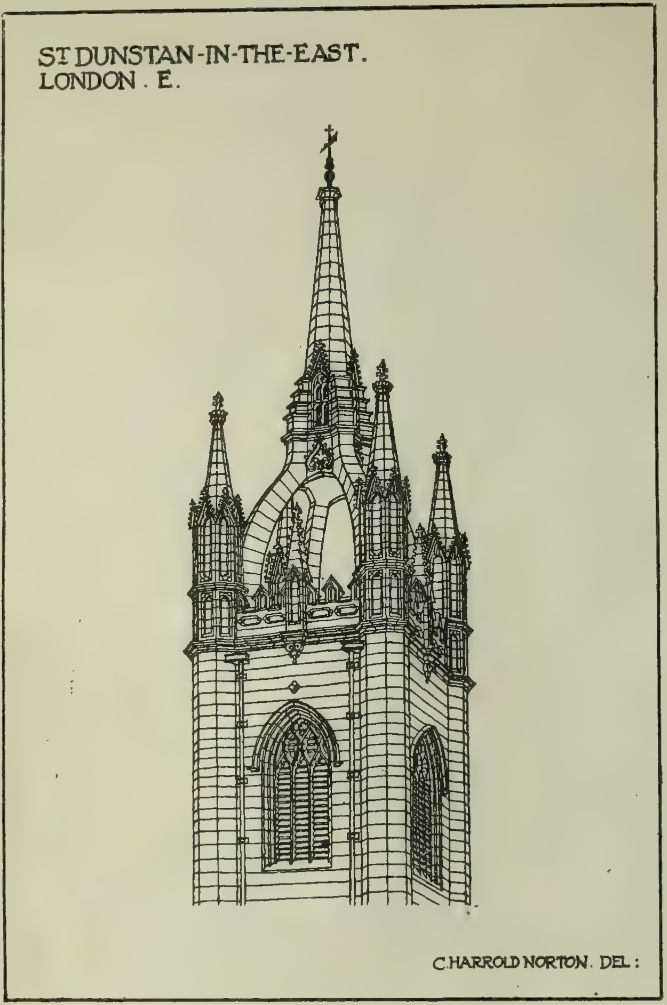
the three examples that of St. Dunstan- e-East possesses the greatest charm and est, and it can be well seen from the bottom t. Dunstan's-hill; the detail also is more refined and more feelingly worked out than that of the two other examples. St. Michael, Cornhill, is a more ambitious and larger rendering of St. Mary Aldermary, which it very closely resembles. The church of St. Mary Aldermary is pleasing, though wanting the feeling which is present in true mediæval work; the fan "ceiling" is an interesting variant of the true fifteenth-century work. It has been much restored and Gothicised, buttresses and new woodwork added, so that its value as an example of Wren's work is considerably diminished. The new Church of St. Dunstan-in-the-East is of the poor wire-drawn Gothic of the date 1817; its architect was Mr. David Laing, who built the Customs House, and he was assisted by Mr. (afterwards Sir William) Tite. The design is well proportioned, but would be greatly improved by good stained-glass windows and the removal of the "churchwarden" woodwork. Were that done, it would externally and internally be more complete and harmonious in effect than either of the two other churches. It is much helped by its very picturesque position. Many of the older monuments have been preserved and replaced, and most of them have merit and interest. St. Michael, Cornhill, has suffered the worst that could happen to any church—a restoration in 1858–60. The work of the late Sir Gilbert Scott proves how difficult it is for an architect to rise above the standard of the age in which he lived. It suffices to say

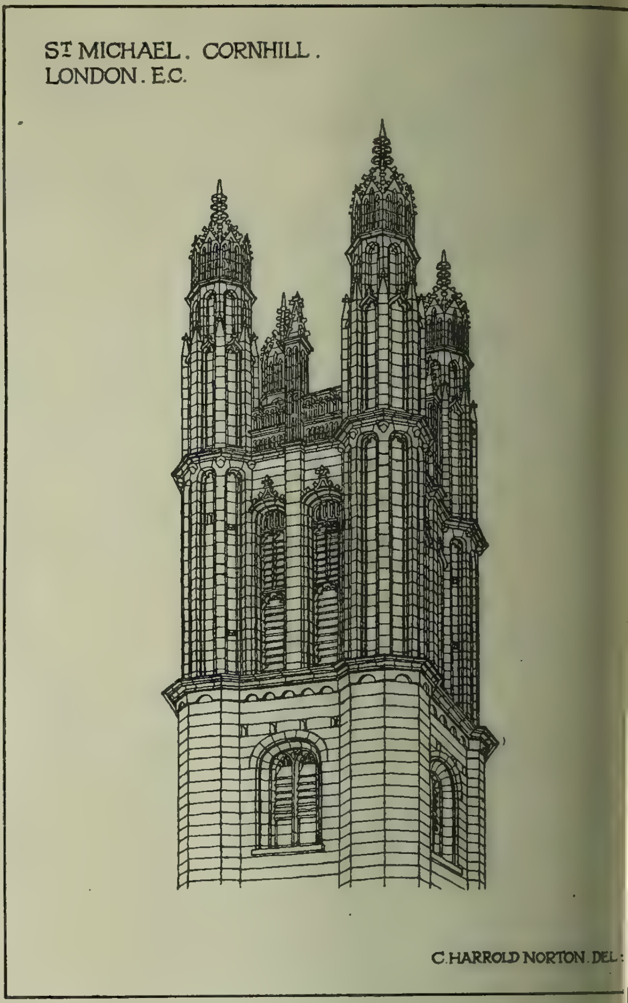


ST MARY·ALDERMARY.
QUEEN·VICTORIA·ST E.C.
C. Harrold Norton del.

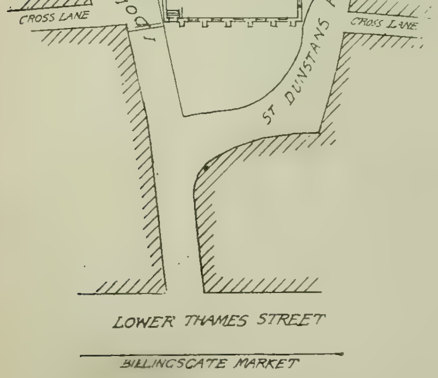


(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)





that the interior of the simple Renaissance church is completely spoiled both by colour and the Gothic windows which fill in Wren's window openings; the new porch to the north is pretentious and commonplace, and the cloistered entrance on the south leading from St. Michael's-alley is fortunately already in a state of decay, while Wren's tower stands like a sentinel over the defacement of his work below.



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

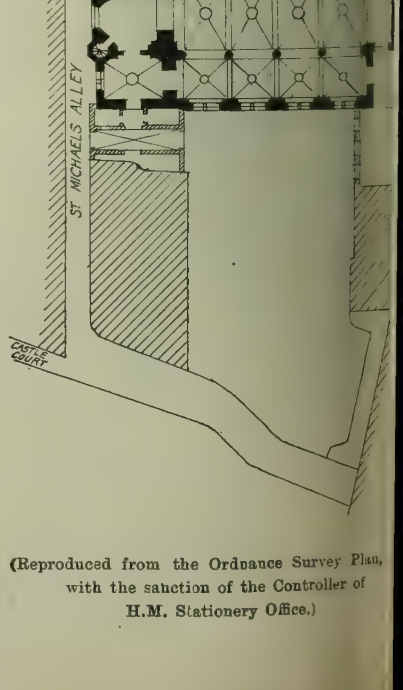
Wren's "Gothic" differs entirely from that of the early Gothic revival, as no attempt is made to reproduce Gothic mouldings. It may be described as a rendering of Gothic forms by means of the use of free detail. The manner in which in the tower of St. Dunstan's the mouldings are stopped by a bunch of foliage is a striking instance of this freedom, which differentiates it from the work of the Gothic revival.

The patronage of St. Dunstan is in the hands of the Archbishop of Canterbury, that of St. Mary Aldermary rests with the parishioners, to whom it was granted in the reign of Henry VIII., while St. Michael, Cornhill, has since the early years of the sixteenth century been in the gift of the Drapers' Company, who obtained it from the abbot and convent of Evesham. A cloistered court existed to the south of the earlier church built on the site.

◆

THE MARRIED SOLDIERS AND THE MORATORIUM.

The Council of the Surveyors' Institution have had under consideration the problem of how to meet the difficulty caused by the calling up for service of married men or those with dependents whose liabilities in connection with the occupation of their houses and other fixed charges cannot be met out of the separation or dependents' allowances. In the opinion of the Council the moratorium, which has been proposed in some quarters as a solution of the difficulty, is open to serious objections of a practical nature which render its adoption inadvisable; and they favour instead the acceptance of the burden, subject to proper safeguards, as a national charge. The views of the Council have been embodied in a communication on the subject addressed to the President of the Local Government Board.



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

KENSINGTON: PAST AND PRESENT.

ORD CLAUD HAMILTON, M.P., presided on rch 17, at the Royal Society of Arts, over first ordinary meeting of the London iety, when Mr. Alfred Moor-Radford ured on "Kensington: Past and Present." he Chairman said he could only contribute item as regarded the past history of Ken- ton. The house now occupied by Sir Walter llimore was sixty-seven years ago the perty of his grandmother, the Dowager hess of Bedford, and he well remembered boy playing in the garden there, and when looked west there was nothing before him green fields and smiling country.

lr. Moor-Radford said he did not intend to mpt to review all that belonged to Kensing- past and present, but would try and bring re them some of the main features, viz., the t historical buildings and the great names hose who from quite early periods up to the sent had resided there. Kensington was nable as a parish in the hundred of ulston, probably a Danish name of one took to himself a large parcel of land in neighbourhood. At the time of the queror the Manor of Kensington was held the Bishop of Constance, granted to him William I. A few years after it was held ler Bishop Constance by Alberceus de Ver, nd Justiciary of England, and whose cendants gave twenty Earls of Oxford to peerage. In course of time the manor a was divided into the Manors of Notting nes, West Town, and Earl's Court, but in seventeenth century they were acquired after another by Walter Cope, who built self the residence presently styled "Holland use." Kensington was proud to call itself Royal Borough, and thus he would deal t with the Palace, although he thought in e respects "Holland House" deserved rity of notice. Kensington Palace, or, as vas then called, "Nottingham House," was l by the second Earl of Nottingham for ,000 to William III. Sir Christopher Wren about improving and enlarging the palace, l in all £60,000 was spent. To Wren was to be ascribed the garden house known the orangery, which he reared for Queen ne at the northern angle of the palace in 5. With the decease of George III. glory arted from Kensington as far as courts were cerned, but to the present generation the ace was most vividly connected with Queen toria, who was born there in 1819. Behind palace and its gardens, stretching from the h-street to Notting Hill-gate, was Kensing- Palace-gardens, and the second house on west side as one entered the road from the th, No. 2, Palace-green, was the one ckeray built for himself and in which he d. The present Kensington Church was work of Sir Gilbert Scott, who endowed it h a spire, which rose with the cross upon apex to a height of 300 ft. It was said to not only the loftiest spire in London, but be excelled in height only by the spires of isbury and Norwich Cathedrals. Near to the Town Hall, a building of Mr. Robert lker's designing, which was opened in 1880. make way for the Town Hall the old Charity ool, designed by Sir John Vanbrugh, most unfortunately destroyed. Almost oining was the Central Library, a rather int-looking building, which was formerly Old Vestry Hall. A little to the west of rch-street formerly stood "Campden use," now replaced by a row of shops. ongst celebrated houses in Kensington was ore House," which was the abode of the brated Countess of Blessington and the naculate Count d'Orsay. Having referred a number of the many famous men and men who had resided in the borough, the urer described at some length the far-famed Holland House." The founder of the Fox ily was Sir Stephen Fox, one of the origi- ors of Chelsea Hospital, and his youngest son the first of the name to own "Holland use." It was the most beautiful and teliest piece of Jacobean architecture in county of London. It dated from 1607, en it was built by John Thorpe, the creator not a few mansions that had survived to these days in various parts of the country. Henry Fox, who became the first Lord Holland of the new creation after the restoration of Charles II., bought the house in 1767, but it was under the third Lord Holland that "Holland House," which he thoroughly renovated, became the chief *salon* of London. He died in 1840, and on the death of his only son in 1859 the barony became extinct. The position of "Holland House," surrounded with terraces, lawns, parks, groves, and walks, the latter left to the wildness of country lanes, was unique in any capital, and it was a phenomenon of London life that within hail of the sounds of a busy thoroughfare the visitor once inside the gates of "Holland House" was transported into the midst of all those sylvan attractions associated with an ancestral and extensive country seat. In 1820 Notting Hill-gate was a farm, and a few years later Ladbroke-grove was the centre of an immense racecourse, known as the Hippodrome. Touching on the squares, the lecturer exhibited views of Kensington-square, once the most fashionable spot in London. Here in 1692 lived the Duchess of Mazarin, niece of the great Cardinal; whilst in 1830–35 Prince de Talleyrand resided at No. 36. In Edwardes-square lived Leigh Hunt. Cromwell-road was said to have been called after the Protector, who was reputed to have once occupied "Shale House." "Scarsdale House" formerly stood in Wright's lane, and parts of it were now incorporated in the premises of Messrs. Ponting. The great educational centres in the Royal Borough, museum land, and the residential district known as South Kensington were the creation of the second half of the nineteenth century, and the outcome of the great Exhibition in 1851. The surplus from the Exhibition was invested in the purchase of undeveloped land in the neighbourhood of the site, and the original proposal of the Prince Consort was that the National Gallery and the Royal Academy and similar institutions should be transplanted to the regions now called South Kensington, and to them should be added a great museum of art and another of science. The scheme had not been carried out in its entirety, but they had the University of London, the Imperial College of Science, the Imperial Institute, the new Victoria and Albert Museum, the Imperial College of Science and Technology, the Royal School of Science, the Royal School of Mines, and the Central Technical College of the City and Guilds of London Institute. There was further the Royal College of Music, and quite recently the Royal Geographical Society had removed to Lowther Lodge. Might not this be the forerunner of many other learned societies locating themselves in the borough, and where could a better site be found than in a portion of the grounds attached to "Holland House," provided that the owners would agree to some of the land being sold for such a purpose? This would indeed be a worthy object for so delightful a resort, and he could imagine colleges arising, probably to be named Victoria, Albert, King Edward VII., Gresham, King's, St. Paul's, and City of London, to rival even those magnificent colleges of learning at Oxford and Cambridge. Surely a magnificent imperial city such as London warranted a finer site for a university than Central London.

The Chairman said they were taking a more sentimental interest in their surroundings than they had done in the past, which led to a healthy municipal feeling.

Mr. E. T. Hall said that the London Society was to be congratulated on getting men like Mr. Moor-Radford, who took such interest in the localities in which they resided, to give lectures. It was by such means that they would get the people of London to take an intelligent, patriotic, and live interest in the places where they dwelt. They were all proud of their great metropolis, but they were more inclined to look upon it as the hub of the universe, whereas in order that it might be beautiful and worthy of the Empire they wanted to foster the feeling which Mr. Moor-Radford had shown that evening.

Mr. Moor-Radford, in reply to a vote of thanks, said what he had done was out of pure love for Kensington. But London teemed with historical buildings.

CORRESPONDENCE.

Wren's Churches.

SIR,—My attention has been drawn to the letter in your journal of February 4 from Mr. L. Latham, who suggests a simple and practical procedure for forming the nucleus of a Wren Museum. It is clear that no scheme involving expenditure for such a purpose would, or ought to, have a chance of success at the present time; but the proposal to collect and arrange existing material is excellent, and should have the strong support of British architects.

To Wren, even more than to his great forerunner, Inigo Jones, we owe, for good or for bad, whatever is distinctively national in our rendering of the architecture of the Renaissance, and the influence of his work penetrates every line of our designers since his time, notwithstanding their individuality or affected "style." It is desirable that opportunity and place should be given for the comparative study of his buildings, whether at the London Museum or the Guildhall; and they should be represented by a complete series of models, if possible to a common scale. "If the whole art of building were lost," said Evelyn, "it might be recovered and found again in St. Paul's, the historical Pillar, and those other Monuments of his happy Talent and extraordinary Genius."

JOHN W. SIMPSON.

The Volunteer Corps.

SIR,—Now that the Volunteer Corps have secured recognition by the War Office, it is most necessary that their ranks should be augmented as much as possible in order that they may efficiently fill the place which will be assigned to them. I appeal, therefore, through the hospitality of your columns to every active man not at present in the fighting forces of the Crown to join one of the Volunteer Corps for the purpose of assisting in home defence and relieving other forces now stationed in England.

Appeal is specially made to (1) men who have been accepted for clerical work and have been put back; (2) men over or under military age; (3) those who may have dropped out at a time when it seemed recognition might be withheld; and (4) men rejected for slight physical defects.

From personal experience I can assure the older men that no demands will be made upon them that are not within their powers and that do not make them better men physically and mentally. Lord Roberts often told us that it is the duty of every fit man to learn to shoot and become efficient in drill, and this can be done in a comparatively short time without interference with business and other duties.

Our battalion offers excellent facilities for London men, the headquarters being within a few yards of Victoria Station. We have a fine drill hall, lecture-room, common-room, with canteen, rifle range, armoury, etc. In addition to the usual infantry training we offer physical drill, musketry, school of arms, lectures, and practical instruction in field engineering, entrenching, bridging, etc. The battalion is now engaged at week-ends upon the entrenchments in connection with the defence of London. Week-end camps are being held and a battalion camp has been arranged for Easter on the North Downs near the trenches.

The Battalion Sergt.-Major is at headquarters every day for the purpose of receiving recruits.

EDWD. GREENOP,
Hon. Secretary, 4th Battalion Central
London Regiment Volunteers.

◆

A DECEASED ARCHITECT'S ESTATE.

The late Mr. John Walton Taylor, of Whiteknights, Castle Leazes, Newcastle-on-Tyne, architect and surveyor, has left estate to the gross value of £21,914.

ST. BARTHOLOMEW-THE-GREAT, WEST SMITHFIELD, E.C.

The history and architecture of this monastic church will be explained to visitors on Saturday, March 25. An organ recital will be given at two o'clock. All parts of the church will be opened to inspection free of charge, but a collection will be made for the Restoration Fund.

GENERAL NEWS.

The Royal Academy Exhibition.

To-day (Friday) has been fixed as the date for sending in architectural drawings, etc., to the Royal Academy.

Memorial to Nurse Cavell, Peterborough.

Mr. Temple Moore, F.R.I.B.A., has visited Peterborough Cathedral in connection with the proposed memorial to Nurse Cavell, who was at one time a pupil of a school in the Minster Precincts. He was met by the Dean and Bishop Clayton, and it was decided that the memorial should take the form of a profile medallion of Nurse Cavell on a tablet to be affixed to the sixth pier from the west front on south side of the nave.

Roman Bust, Devizes.

A fine bust of Romano-British workmanship has recently been added to the Devizes Museum's collection. Mr. R. J. Shackle, of Trinity College, Cambridge, had his attention called to the work early in 1912 by a friend, who was the first to perceive its Roman origin. Only a few weeks afterwards the same identification was made independently by Capt. B. H. Cunnington, of Devizes. Mr. Shackle has further submitted photographs to Messrs. H. B. Walters, of the British Museum, and A. B. Cook, of Queens' College, Cambridge, who agree in considering the work a genuine relic of antiquity. When first noticed the bust stood in Macklin's-court, Marlborough; unfortunately it has not been possible to trace its original provenance.

Trade with Spain after the War.

According to information furnished by H.M. Consul at Bilbao (Mr. A. M. Madden, C.M.G.) local business men anticipate that after the war there will be a rush of Germans to Spain intent on doing business in and trading with that country. Before the war Spain was flooded with cheap German goods, and it is reported that 75 per cent. of the machinery, tools, electrical fittings, etc., in use in Bilbao is of German manufacture. Many of these goods are highly finished, but very poor in quality; nevertheless, they are preferred by the Spanish purchaser on account of their cheapness. The present is, however, considered a good moment for introducing United Kingdom manufactures. H.M. Consul therefore suggests to United Kingdom firms, if they wish to preserve their position in Spain, they should consolidate their connections and *clientèle* so as to be able to compete against the expected German business effort. He adds that large numbers of Germans are now in Spain employed in obtaining information on every kind of subject, and no doubt the point of view of future trade is being carefully studied by them.

Exhibition of German Catalogues in London.

In order that British manufacturers may have an opportunity of familiarising themselves with German methods of publicity the Board of Trade have collected over 3,000 specimen catalogues of German origin, and these may be inspected at the Foreign Samples Section of the Commercial Intelligence Branch, 32, Cheapside, London, E.C. The collection, which is illustrative of a great variety of industries, includes 887 catalogues of machinery. One feature of the catalogues which is of especial interest to British manufacturers who are themselves publishing catalogues with a view to increasing their export trade is the number of foreign languages in which the German catalogues are printed. Many are polyglot in character, and are printed in three, four, and in some cases five different languages. A complete index has been prepared, in which the catalogues are classified both as regards articles of manufacture and names of manufacturers, thus rendering identification of any particular catalogue a simple matter. Copies of the index may be obtained by United Kingdom manufacturers on application to the Director, Commercial Intelligence Branch of the Board of Trade (Foreign Samples Section), 32, Cheapside, London, E.C. Arrangements have been made whereby catalogues may be lent for a few days to United Kingdom firms established in the provinces.

Bust of Sir Archibald Geikie.

A bust of Sir Archibald Geikie was unveiled recently by Sir William E. Garforth on the main floor of the Museum of Practical Geology, in Jermyn-street, with which Sir Archibald was connected for many years in the capacity of Director. The bust has been executed by Professor E. Lanteri, of the Board of Education.

New Associates, Royal Scottish Academy.

At a General Assembly of the Royal Scottish Academy three new painter Associates and one architect Associate were elected. Those gentlemen who were successful in the voting were:—Painters, Mr. Henry Lintott, Edinburgh; Mr. David Alison, Edinburgh; Mr. Archibald Kay, Callander; architect, Mr. James A Morris, Savoy Croft, Ayr.

London Topography in Stained Glass.

A meeting of the Society of Antiquaries was held on the 16th inst., when Dr. William Martin read a paper on the "Topography of London as revealed in the Stained Glass of Lincoln's Inn Chapel." He said that in one of the windows of the south side there was a remarkable series of diminutive views of London, the original sketches of which were unknown, but it was evident that the stained-glass artist worked from faithful pictures then extant. These stained-glass pictures compared very favourably with the Elizabethan and Jacobean panoramic views of London, and it was remarkable that London topographers had not gone to the Lincoln's Inn windows to check conclusions they had drawn from other sources.

Proposed Association of Master Painters and Allied Trades.

A meeting will be held on Thursday next, March 30, at 7.45, at Limes Hall, Limes-grove, High-street, Lewisham, and another on the following day, Friday, March 31, at the same time, at Croydon Public Hall, George-street, Croydon, with the object of forming local associations of master painters, decorators, and kindred trades for the districts of Lewisham, Deptford, Greenwich, Catford, Forest Hill, Ladywell, Hither Green, Lee, Blackheath, Brockley, and New Cross, and also the districts of Croydon, Thornton Heath, Waddon, Sutton, Carshalton, Hackbridge, Wallington, Beddington, Purley, Addiscombe, etc. Every employing painter, builder, etc., is asked to attend. The speakers will include several representatives of the National Association of Master House Painters and Decorators, and others representing the London Association of Master Decorators. Tickets of admission may be obtained from Mr. Arthur S. Jennings, Editor of the *Decorator*, 365, Birkbeck Bank-chambers, High Holborn, London, W.C.

Chadwick Public Lectures, 1916.

A course of three Chadwick lectures on "The Domestic Arterial System in Relation to Comfort and Health," by Dr. Charles Porter, Medical Officer of Health, St. Marylebone, is being delivered at the Household and Social Science Department, King's College for Women, Campden Hill-road, Kensington, W., on Wednesdays at 3 p.m. The first lecture, on "Drains and Drainage," was delivered on the 15th inst. A special interest attaches to this course of lectures, inasmuch as the subject was chosen upon the suggestion of Miss Chadwick, daughter of the founder of the Trust, the design of the course being to instruct women householders, matrons of hospitals, and women heads of institutions in the regulation and management of the many pipes, wires, and other mechanisms which form the complicated arterial system of every modern residence. This course is also the first to be given at the new Household Social Science Department of King's College for Women. In the course of his lecture Dr. Porter said, though in every way possible the various apparatus were made self-cleansing, it was necessary that they should be looked after and examined from time to time. In all of them there were weak points which he indicated. He advised regular and routine examinations on the part of the householder. A large number of slides illustrating the construction of a drainage system were shown, and hints given as to the best type of apparatus to choose for various purposes in relation to drainage.

A Promotion.

Lieutenant Richard Twelvetrees has be gazetted to a captaincy dating fr February 1 last. Captain Twelvetrees attached to the headquarters staff of British Expeditionary Force in the capac of Inspecting Officer of the Army Service Co Mechanical Transport.

Scott Memorial in St. Paul's.

The Prime Minister will unveil, after East the bronze memorial tablet in St. Pa Cathedral to Capt. Scott and his companic in the Antarctic. The sculptor is Mr. Nicholson Babb, and the tablet, which has bo provided by public subscription, bears inscription by Lord Curzon.

A Raemaekers Poster.

M. Louis Raemaekers, the famous Dut cartoonist, has drawn for the Natio Committee for Relief in Belgium one of remarkable "War Posters." A Belgi woman, with a ragged red cloak over shoulders, is holding tightly to her breast infant in a shawl. Around the child is clasp the mother's hand—a hand which sp starvation. The poster, which is artistica reproduced, has this laconic heading, " Belgium." Underneath appears the one wo "Help." Any of our readers can secure copy of the poster free of cost by sending postcard to the Hon. Secretary, Natio Committee for Relief in Belgium, Trafalg Buildings, Trafalgar-square, London.

Church Building Society.

The Incorporated Church Building Socie held its usual monthly meeting on the 1t inst. at the Society's House, 7, Dean's-ya Westminster Abbey, S.W., Lieut.-Colonel t Hon. G. H. W. Windsor-Clive in the cha Grants of money were made towards buildi new churches at Goodmayes, St. Paul, Ess £150; and Scotswood, St. Margaret, ne Newcastle-on-Tyne, £130. Grants were a made towards enlarging the Church of Hilda, Ravenscar, Yorks, £20; and repairi Wigginton, St. Giles, Oxon, £10. The followi grants were also paid for works completed: Cwmbran, St. Gabriel, Mon, £175; Belmo St. John the Baptist, Surrey, £130; Anwi St. Edith, Lincs, £25; and Southend, Erkenwald, £30. In addition to this the su of £96 was paid towards the repairs of elev churches from Trust Funds held by the Societ

The Timber Difficulty and the Forests of Russ

Mr. E. P. Stebbing, head of the Departme of Forestry, University of Edinburgh, gave lecture last week on "Forestry and the Wa at the Royal Society of Arts, London. T war, he said, had found this country tota unprepared as far as its timber supply w concerned. Building on a stupendous sca would require to be undertaken after the wa and the question arose where the timber requir for this new construction was to come fro His proposition was that the Allies should co to a definite understanding now, and pla themselves in a position to control the Europe timber market at the end of the war; to exerci in effect a State control over prices for a ti as the only effective means to cope with t enormous demand which would exist, and prevent the formation of timber "rings either by the Central Powers or others. It w desirable that they should have accessib supplies in large quantities and owned by t Allies, and that there should be an agre ment that these should be made availab at the earliest possible moment, with the obje of bringing down the present prepostero rates. There was a gigantic forest area Russia, which would fulfil the objects require Russia in Europe had an area of 447,500,0 acres of forests; Finland had 62,800,000 acre and Siberia and Turkestan the gigantic tot of 853,000,000 acres. His suggestion was th Russia be asked to institute fellings on a lar scale, and to get the work set agoing at hi pressure as soon as possible. Whatever t sum necessary, it would be money well laid ou All that was required was a practical worki scheme. This country could lease for a peri of years and work a large area or sever areas of the Russian forests. He urged, to that as soon as possible trees be planted in o own country to meet our requirements.

LAW REPORT.

OFFICIAL REFEREE'S COURT.

(Before Mr. VEREY.)

Hawkins v. Farnfield.

his action, which raised an unusual point the finality of an arbitrator's award lation to dilapidations, Mr. Edward ins, Mr. Alfred T. Hawkins, and Mr. Barkett, the owners of 19, Longlands- Sidcup, Kent, known as Sidcup College, to recover damages for breach of ing covenants of a lease from the de- nts, Mr. Samuel Farnfield, of Sidcup Sidcup Green, and Mr. Algernon Samuel eld, of Barming Asylum, Barming, Kent.

n counsel's opening statement it ap- d that the defendants were the assignees ease granted in 1901 by the trustees of operty to a Mr. John Sandercock for a of twenty-one years, and that lease was ed to the defendants in the following and they remained in possession down to mmer of last year. The premises were s a boys' school, and prior to the year ey had got into a bad state of repair. endeavouring to get them put in order intiffs had a survey made in 1913 under se in the lease which gave them power er and inspect. A notice was served he defendants, and under it some repairs lone, but very little, and the result was n August 12, 1913, a writ was served ng damages for breach of covenant. The ad a clause in it enabling the defendants e notice to terminate at the end of seven rteen years, and at the latter period such was given, which enabled them to leave 5. The proceedings against them for lations were set down for trial at the Assizes at Maidstone, but before the case on an agreement was come to, under judgment was to be signed in plaintiffs' , subject to an agreed sum for costs. was nearly twelve months after the writ sued. Part of the terms of the agree- was that the defendants should carry out of the works specified in the notice, and ny dispute should be submitted to arbi- . Disputes did arise as to liability, and atter went before an arbitrator, who in of last year awarded plaintiffs £92 in of the matters submitted to him. The erminated in accordance with the notice e of last year, and when the defendants out they had spent nothing on repairs a small sum spent after the notice was , the place being left in a dilapidated on. The plaintiffs instructed a surveyor new the premises to go over them and a survey, with explicit instructions not ude in this schedule any of the items which Mr. Flint, the arbitrator, had ted. The defendants denied that there een any breaches between the date of ward and the time the action was t, and said that the plaintiffs were suing at which they had recovered under the The lease having terminated, at de- ts' option, at the end of the fourteenth they were, contended counsel, bound to the outside at the end of that year, as s the inside, whatever might have been before. The clause in the lease which with the state of things at the termina- f the lease was not, he said, before the tor. The arbitrator's award of £92 was ect of the state of the premises before estion of the determination arose. The ment had now taken over the premises unition works, but the plaintiffs were d to claim £40 for the loss of a quarter's s the repairs would have taken a month y out.

Hamilton Hall Turner, surveyor, of vay, Westminster, gave evidence in sup- the plaintiffs' claim, estimating the cost airs at £246.

Referee, after hearing further evidence, for the plaintiffs, awarding them £240 ect of the dilapidation and £40 for loss .

MEMORIAL TO SIR EDWARD HULSE.

marble tablet erected by citizens of ry in memory of Capt. Sir Edward Scots Guards, who was killed at Neuve le, was unveiled at Salisbury Cathedral eek. Beneath the inscription is the and motto of the Scots Guards within a of bays. The tablet is the work of Mr. kman, of Camden-square.

ILLUSTRATIONS.

The Work of Alfred Stevens.

In mentioning in our issue of March 10 the admirable lecture given by Mr. MacColl, LL.D., on the work and life of Alfred Stevens, illustrated by slides taken from this artist's original drawings, we were able to promise our readers in a later number reproductions of two of these drawings.

We can now in our present issue fulfil this promise, and thus assist in calling attention to the work of a genius in art whose merits are only now beginning to be more fully recognised.

Alfred Stevens was born about 1818 into a period which, compared with the late eighteenth century or even the late nineteenth, might be called one of artistic stagnation; and the width and universality of his genius were not appreciated by his contemporaries. He was clear of academic training, and his studies were direct from the frescoes, the sculpture, and canvases of the great Italians during a fruitful visit of nine years to Italy.

At Florence he was studying Spinello, the Arctine, and Giotto, at Venice (1839) Titian, at Rome the great Michelangelo, while he was working at the same time in that city for the sculptor Thorwaldsen. In these studies he drew in from these great masters of their time the very spirit of the Renaissance; he allowed his sympathies "to expand over all forms of art."

And that was what his contemporaries could not understand. Coming back to England (1842) he was absolutely penniless, and, though he obtained a professorship of design three years later, he was glad to take the post of chief designer of bronze and metal work to Messrs. Hoole, Robson, & Hoole, of Sheffield, who manufactured stoves, firedogs, and grates from his design. But to whatever he touched he gave something of his creative power. His red-chalk figure studies recall those of the great Italians in their freshness and force. But it is really as a sculptor that Stevens is best remembered, and in this connection his name must always be associated with the Wellington Memorial in St. Paul's Cathedral, to which Mr. MacColl alluded at some detail in his lecture, and pointed out that in the competition his design only gained the sixth place, and was accepted finally because of its better adaptation to the position to be filled.

In another age he might have been earlier recognised and have given an impulse to British sculpture which it badly needed; to our age it is left to appreciate his genius, to admire its diversity, and to study its lessons.

Bath Improvement Scheme.

We give further illustrations of this excellent and practical scheme. In some towns architectural improvements may be described by the sternly practical as luxuries, though we do not so regard them. In the case of Bath they are an addition to its working capital, and the more urgent the need for economy after the war the more it becomes necessary to increase dividends, municipal and otherwise. We therefore consider a scheme of this nature in the same category as an addition to the manufacturing plant of a great commercial business or factory.

We give as an extra inset another reproduction of a drawing of Mr. Atkinson's scheme, which we illustrated a fortnight ago. In consequence of some unusual difficulty some of the reproductions of this plate were not altogether satisfactory.

Nos. 211 and 213, Regent-Street, W.

These premises were erected from the designs of Messrs. Henry Tanner for Messrs. J. Lyons & Co., Ltd., and the work was carried out by their own building department. The front is in Portland stone, and the design forms the centre feature of the proposed new block, extending from Conduit-street to Maddox-street.

The building was originally intended to provide two shops to Regent-street, hence the setting out of the steelwork, but Messrs. Lyons decided later to occupy the whole of the premises themselves. The accommodation consists of commodious refreshment-rooms on the basement, ground, first, and second floors, with ladies' toilet-rooms, etc., on the third floor and kitchens above.

The shop front was carried out by Messrs. H. W. Cashmore & Co., and Mr. J. A. Stevenson was responsible for the stone carving.

The list of sub-contractors was as follows:—

Portland stone—Messrs. W. Tomes.
Constructional steelwork—Messrs. Redpath, Brown, & Co., Ltd.
Iron escape staircases—Messrs. H. & C. Davis, Ltd.
External ironwork—The Albany Forge, Ltd.
Lift—Messrs. Waygood-Otis, Ltd.
Mosaic work—Messrs. Fenning.
Fibrous plaster—Messrs. Marshall & Co.

Wren's Churches.

We give further reproductions of some excellent photographs by Mr. George Trotman of the Churches of St. Augustin with St. Faith, St. Michael's, Cornhill, St. Dunstan-in-the-East, and St. Edmund King and Martyr.

OBITUARY.

Mr. H. W. D. Theobald.

We much regret to record the death o Henry Wells Dewhurst Theobald, a known surveyor. Born in 1844, he became a pupil and assistant in the fir Messrs. Gardiner & Bell, quantity surveyo 110, Gt. Russell-street, and upon Mr. retirement he was taken into partnership b Gardiner. In time Mr. Theobald succeed head of the firm, and for many years carried large practice under the title of Messrs. Gar Son, & Theobald, and subsequently Messrs. diner & Theobald. The last twenty years h assisted by his son, Mr. J. M. Theobald, will continue the practice. During Theobald's career he was engaged in a number of important buildings, including erected by H.M. Office of Works. He elected a Fellow of the Surveyors' Instit in 1883. His courtesy, integrity, and tho knowledge of his work led to his being frequ asked to act as arbitrator in building dis The many architects with whom he necessarily much in contact will, we are testify to his ability and attention to interests of their clients. On the other he was not unmindful of the rights o builder, particularly in complicated que of account, where he was practically the ar Mr. Theobald was well known for w within his estimates.

The writer of these notes, who had k him for upwards of fifty years, mourns hin friend and a most careful and reliable ad Mr. Theobald died at his residence, "H House," Spring-grove, Isleworth, on the 9t after a short illness.

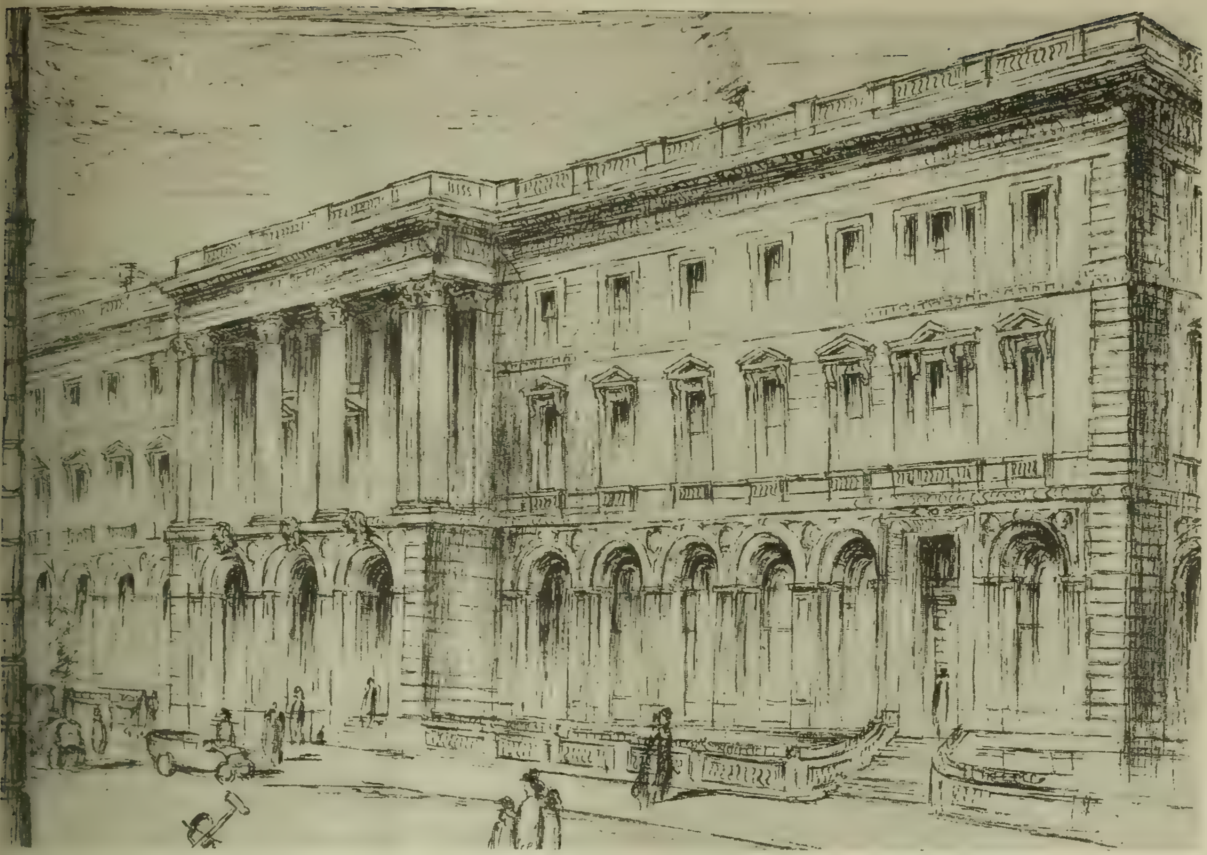
◆

FIFTY YEARS AGO.

Designs for Sunderland.

The civic Solons, in the Sunderland Council, have hit upon a novel pla obtaining designs and estimates for new Town Hall. What think you? are to communicate with the different porate authorities in the kingdom fo purpose of being supplied with copi their plans and the cost of erection, then to select from amongst them the answerable. The architectural profe may well tremble at such an innov *Sans* Sunderland—*sans* everything.

[*** From the *Builder* of Marc 1866.—Ed.]



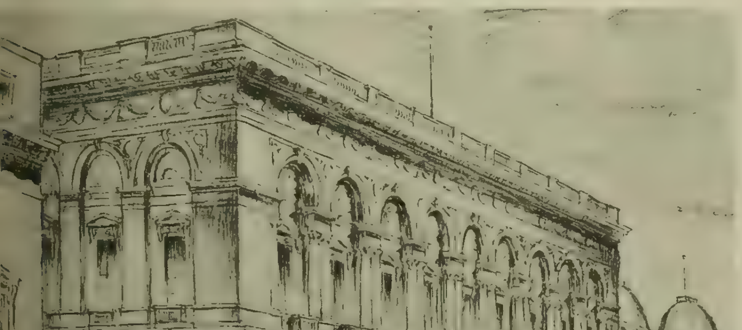
The General Post Office.

SOME MANCHESTER SKETCHES.

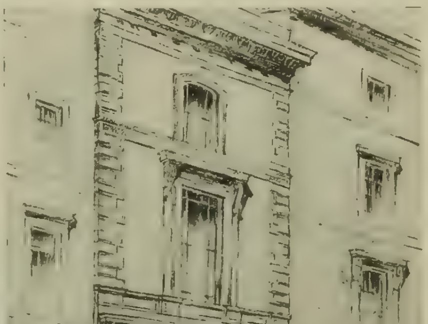
E accompanying sketches are by Mr. on Hemm, who has sent us the ing notes :—

General Post Office was erected as ly as 1884 from the drawings of the ames Williams, some time architect to ffice of Works. The design of the Office is consistent in all four eleva- the accessory details are carried out spirited regard for the dignity of the building, and moreover the character rect. The elevation to Spring-gardens ndiose (see sketch). This front, with its excellent detail and refined treatment of masonry, should be studied by students with a reverence akin to that usually bestowed on buildings belonging to a more remote period. The elevation to Brown-street is broad, simple, and unaffected.

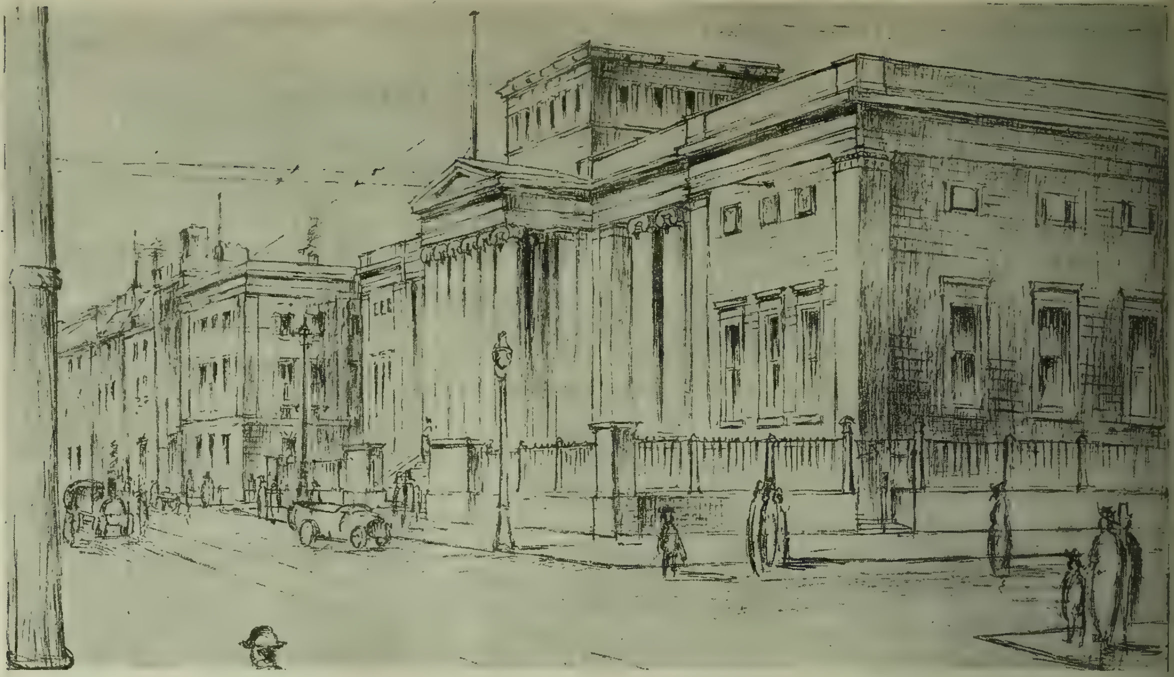
Edward Walters, the architect of the Free Trade Hall, was the son of John Walters. When only thirteen years of age he entered the office of his father's assistant, Isaac Clarke. Later, he assisted Lewis Vulliamy, and eventually Mr. (afterwards Sir) John Rennie, by whom he was sent to Constantinople to act as architect to the small arms factory which Rennie built for the Sultan of Turkey in the 'thirties. Walters came to Manchester just at the time when the well-known architect, Lane, was retiring from practice, and had the support of such an influential patron as Cobden. Walters inherited from his father an instinct for dignified architecture, and this led him to follow the Pallazzo model, which Barry had previously introduced with such success for his clubs in Pall Mall. One of his most important works was a warehouse in



The Free Trade Hall.



Messrs. Armitage & Wolff's Premises.



The Art Gallery.

Portland-street, Manchester. At that time there arose a speculative mania for erecting large warehouses, and Walters had the ability to see that such utilitarian structures were capable of being ennobled by the attributes of art; in particular, he recognised that there was an opportunity for breadth and repose. In 1853 came the opportunity that Walters needed to demonstrate his ability to undertake work of the first order—namely, the Free Trade Hall. It was opened in 1819. The façade is 159 ft. long in Peter-street and 75 ft. high.

Following this notable achievement came the commission for the Manchester and Salford Bank in Mosley-street. The design of this building is masterly in every regard, the gigantic doorway connecting the two blocks in Mosley-street, forming a monumental composition which is unequalled in the North of England. Walters retired from practice in 1865, dying at Brighton on June 22, 1872.

Sir Charles Barry, the architect of the Manchester Art Gallery, was born in 1795. After spending six years with Middleton and Bailey, he determined to study abroad, and, taking advantage of a small legacy left to him by his father, he started in 1817 on his foreign travels, visiting principally France, Germany, Italy, Greece, Turkey, and Egypt. He returned to England in 1822, and commenced practice. One of his chief works was the Travellers' Club, Pall Mall, erected in 1829, which marked a new departure in Classic design, and, besides being one of the earliest, is undoubtedly the best of Barry's buildings. The Manchester Art Gallery, the Travellers' Club, and the Reform, London, some of his earliest works, are simple both in conception and handling; but his later designs are the reverse, being devoid of restraint as well as complex in the composition of the minor parts. Barry, at the height of his fame, led the Italian school, and had many followers and imitators; his chief pupils were his two sons, Robert Banks, J. Somers Clarke, and John Gibson.

Professor Charles Robert Cockerell, R.A., was born in 1788. In 1810 he started on a long travelling tour. He returned to England after about seven years' absence. His immense knowledge of Classic art was drawn direct from the fountain-hea
inspiration. Like Sir C. Wren, Coc
began the practice of architecture som
late in life, although he had a far g
knowledge of form than had the f
master. At the age of twenty-nin
brought from abroad a great reputati
a scholar, which gained for him many f
and clients.

One of his earliest works was the Li
Institution at Bristol. He des
numerous banks in different parts o
country, including the branches of the
of England at Manchester (see sk
Plymouth, and Bristol in 1844, the s
branch at Liverpool in 1845. In
Cockerell won the competition for the g
at Oxford known as the Taylor and Ran
Buildings—the largest of his works—
he completed in 1845. He des
numerous other buildings too well kno
mention. All Cockerell's later works
of such importance that it is difficu
give preference to any particular build
being his masterpiece. The great arc
died in 1863 and was buried in St.
Cathedral.

THE BUILDING TRADE.

ILITY FOR DANGERS EATED ON HIGHWAYS.

ur issue for November 19 last we dealt ith the liability of builders towards those ho come upon the premises where build- ations are being carried on, and in the f that article we mentioned the obligation create any danger adjoining a road h the public had access. In building ns it is sometimes necessary, however, eave from the road authority, to open carry out some work on the highway nd therefore we may in this connection a recent case, Crane *v.* South Suburban npany (1916, 1 K. B. 33), as showing the y of taking every precaution where such ns are being carried out. The Gas y in this case were acting under y powers, so their position was stronger ould be that of a private individual, refore the case is the more instructive.

course of repairing a gas main the nts' workmen placed a fire-pail on the d forecourt of a house to which the had access, a few feet from a public , and on the fire was a ladle containing lead. Some children were playing y, and the workmen had previously m to keep away from the fire. A boy by accidentally knocked over the fire- d some of the molten lead was spilled foot of one of the children, the plaintiff action. The case came before a al Court on appeal from the County udge, who had awarded the plaintiff £25 s. At the time of the accident all the re working in the trench in the road, fire was unattended. The defendants hree contentions by way of defence :— t there was no duty upon them except reate a hidden danger in the nature of a 2) that there was no evidence of any ce or breach of duty on their part; that even if there were a breach of duty not the cause of the accident, the real eing the intervention of a third party, .

Divisional Court upheld the finding of nty Court judge, holding that the point trap had nothing to do with a wrongful mitted on a highway or on land adjacent which the public have access, that the a dangerous thing to place in or near way if it was left unguarded or unfenced, at the intervention of the third party break the link of causation connecting ng with the injury resulting from it.

the above case may usefully be con- that of Ruoff *v.* Long & Co. (1916, 148). There three men in charge of a s steam lorry, whilst delivering beer, in the highway for a few moments ded, but before leaving it the driver engaged the gear lever and fixed it with pin, the effect of these precautions being start the lorry four operations would ssary. Some soldiers out for mischief the lorry, and the plaintiff, a shopkeeper, d damage. A Divisional Court, re- the decision of the County Court judge, at there was no evidence of negligence; lthough this finding was sufficient to of the case, one of the judges held also en had there been negligence yet the ce would not have been the proximate f the injury, or, in other words, the tion of the soldiers was an independent hich could not reasonably have been ted.

is latter case the third persons who ed were persons of full age, but we may those who are called upon to undertake rk upon or adjoining highways that all people have a right to be on the highway, g children, and therefore the greatest of care is essential, for what might not anger to a grown-up person may well to a child. Lord Justice Hamilton in a recent case (Lathom *v.* Johnson (1913), 1 K.B. 398), where a child had been injured on unfenced ground, said, "Children's cases are always troublesome. English law has been very ready to find remedies for their injuries."

Without entering into this debatable ground, we may suggest that where a child suffers injury from something placed on or near a highway a different standard of care may be demanded from the person placing it there, and it may be more difficult for him to prove the intervention of a fresh and independent cause if it is the action of a child which causes injury to be occasioned by the thing so left to a third person.

THE LONDON MASTER BUILDERS' ASSOCIATION.

The Council found it necessary to meet on three occasions during February. During the month important matters were dealt with by the various trade committees.

We take the following from the February Report :—

The Burden of the War.

The request from the operative societies for advances in wages and alterations to working rules was considered at a special meeting of the Council early in February, and a copy of the following resolution was sent to each of the bodies in question :—"That in the present abnormal conditions of work and market prices and uncertainty of obtaining materials the time is not suitable to arrive at any conclusion as regards alterations in the working-rule agreements, and it is proposed to defer the consideration by mutual consent until a later date, as at present the energies of all concerned are needed for prosecuting the war." This appeal has not so far met with success, and the matter will be considered in due course by the respective joint trade committees.

Restriction of Building Work.

Careful attention is being given to representations from the Ministry of Munitions as to stopping all unnecessary building work in order to increase the supply of labour required for erection of munition factories and other Government requirements. A representative of the Department attended a meeting of the Council of the Association, and broadly defined the procedure that may be necessary, replying to numerous questions, including inquiries as to how far builders and other employers would be protected in respect to the conditions in their contracts if their works were stopped. The interests of members will be carefully watched and so far as possible protected.

Painters and French Polishers.

The Operative Painters in February made application for the recognition of a flat rate of 10d. per hour for painters in London. No working-rule agreement exists with the painters, but the rate recognised by the Association is 9d. for painters and 9½d. for decorators. The Society has been informed that the request cannot be conceded, especially in view of the fact that any advance in existing rates for labour is deprecated by various Government Departments.

The Operative French Polishers made formal application to the Cabinet Trades Federation (whose members employ the bulk of that class of labour) for an increase of 1d. per hour on the existing rate of 9½d. Neither this Association nor the Cabinet Trades Federation has a working-rule agreement with the french Polishers, and the Federation after meeting the operatives declined to concede the demand. It is hoped that members who employ french polishers will support the action of the Cabinet Trades Federation and also take what steps are possible to induce any piece-master they may employ to do the same, as the present rate of wages for french polishers compares very favourably with the rates of wages in the other trades.

THE YORKSHIRE FEDERATION OF BUILDING TRADES EMPLOYERS.

The monthly meeting of the Executive Council was held in the Standering Hall, New-lane, Selby, on Thursday, March 16. Mr. R. Finch (President) occupied the chair and thirty-nine delegates were present.

Belgian Builders' Relief Fund.

The National Federation has issued an urgent printed appeal for increased funds for this beneficent purpose. The President earnestly commended the appeal to the generous support of members, and hoped all would appreciate the opportunity afforded of extending practical sympathy with Belgian *confrères* whose necessities are urgent and whose claims are most deserving.

Munitions Act, 1916.

Representatives of the National and Yorkshire Federations have been favoured with interviews with principal officials of the Ministry of Munitions, and placed before them the serious shortage of labour in the building industry, and the necessity of securing sufficient and efficient labour for works for military and naval purposes. The officials stated that similar representations had been made by Government officials concerned in the letting of work and placing of contracts. The matter is being very carefully considered, and promise was made that the earliest possible intimation would be given of the decision of the Special Committee dealing with the subject.

Home Problems after the War.

An official invitation for the Federation to be represented at the National Congress to consider Home Problems after the War, to be held in London from April 11 to 14, was considered. The National Federation had called the attention of the County Federations and local associations to the importance of the Conference, and recommended that the invitation should be given serious and sympathetic consideration. It was resolved :—"That the Federation be represented at the Conference and that the President, Mr. Sinclair, and the Secretary be appointed as the representatives. Also that the local associations be urged to appoint representatives to the Congress, as its decisions may be of vital importance to building trade employers."

PRIMITIVE ARRANGEMENTS.

We have before us an amusing letter from a military officer in India, in which he regrets the primitive methods in existence there. He says :—"Water supply arrangements in India are odd. They lay on the water in the streets, and sometimes actually up to buildings, but never put a tap in the bathrooms. For instance, in this really nice comfortable, even luxurious, hotel, in which each bedroom is provided with a bathroom, and in it a beautiful full-sized Jennings bath, the water is heated by the bachti in an old kerosene tin, on a charcoal stove, Stone-Age type, and is poured into the bath in somewhat minute and intermittent quantities. When you have bathed you pull up the plug, and the water flows through on to the floor, passing through an orifice provided in the wall of the building, and so to the garden below. Very sad to see a Jennings bath standing all lonely in the middle of a whitewashed room of fair size and not a pipe or a tap connected thereto to give the poor thing some hold on life."

Messrs. Jennings, in sending us this letter, say :—"It is hardly necessary to mention that we were asked to supply these baths through a firm of merchants, and were in no way concerned in regard to the installation of them."

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—At a recent meeting of the T.C. plans were submitted by the Burgh Surveyor for an alteration at the police workshops. The Plans Committee of the T.C. has passed plans of the following new buildings:—Alterations and additions in connection with the dwelling-houses, No. 60, Union-row, for Mr. G. G. Littlejohn, house proprietor, per Messrs. Wilson & Walker, architects; alterations on shop front at No. 199, Union-street, for the North of Scotland Canadian Mortgage Company, Ltd., per Mr. G. B. Mitchell, architect; alterations at Nos. 151 and 155, Union-street, for Messrs. M'Millan, Ltd., per Messrs. E. Pollard & Co., Ltd., London; addition to wooden pavilion at the City Hospital, for the T.C., per Mr. John Rust, architect; store at No. 80, Spring-garden, for Messrs. William M'Kinnon & Co., Ltd.; polishing mill and dressing sheds on the north side of Merkland-road East, for Mr. Robert Crofts, granite merchant, per Mr. George Watt, architect; two dwelling-houses on the west side of Brighton-place, for the Northern Garden Suburbs, Ltd., per Messrs. D. & J. R. M'Millan, architects; two dwelling-houses on the west side of Brighton-place, for the Northern Garden Suburbs, Ltd., per Messrs. D. & J. R. M'Millan, architects; additions and alterations on premises, No. 55, Blenheim-place, for Mr. Andrew Alexander, cabinetmaker, per Mr. R. R. Gall, architect; addition in connection with Home for Soldiers and Sailors on the west side of College-street, for Miss Reid, Albyn-place, per Mr. John Rust, architect.

Barrow.—The T.C. has appointed a sub-committee to prepare a scheme for the provision of houses for their workmen.

Brighton.—Plans have been passed for the alterations to the interior of the Hippodrome.

Bristol.—At a recent meeting of the Bristol Docks Committee an application was submitted from the Dockers' Union, supported by members of the Bristol Cartowners and Warehousekeepers' Association, for permission to erect a shelter for trace horses on the quay adjoining the approach to Bristol Bridge on the downstream side. The matter was left for further negotiation between the officers and the parties interested, the committee expressing their willingness to favourably consider a suitable proposal.

Calgary.—The Ford Motor Company has decided to establish an assembling plant at Calgary, and has bought a site in the city for that purpose.

Catterick.—At the Bedale Police Court recently plans were submitted to the magistrates on behalf of Mr. Haswell, Darlington, for a cinematograph building to be erected at Scotton.

Droylesden.—The D.C. has approved plans of seven houses to be built in Baguley-street, for Mr. F. Houghton.

Dublin.—The Corporation has decided to raise £8,000 out of the rates for the purpose of erecting a number of working-class dwellings. The Dublin Municipal Council has sanctioned proposals to take over the Newfoundland-street area, on which the intention is to build cottages, when they have obtained the money and the sanction of the L.G.B. The Council has also adopted the recommendation of the Housing Committee for a loan of £138,944 on the North Lotts area for the purpose of building a large number of cottages.

Dukinfield.—The following plan has been recommended to the T.C. for approval:—New joiners' shop and offices in Railway-street, for the Stamford Building Company, Ltd.

Dundee.—Plans of proposed new buildings, etc., in Dundee have been lodged at the office of the City Engineer as follows:—Overgate, addition to office, for Messrs. Kirk & Coutts; Panmure-terrace, Barnhill, garage, etc., for Mr. James Fearns; Byron-street, extension of, for Messrs. Francis Stevenson & Sons and the Bank of Scotland.

Glasgow.—The following linings have been granted at Glasgow Dean of Guild Court:—The Ioco Proofing Company, Ltd., Netherton Works, Anniesland, to erect a store and drying-room there; Messrs. Campbell, Achnach, & Co., Ltd., indiarubber manufacturers, to add to their works in Commerce-street; Messrs. Gibson Brothers & Co., to erect a factory in Cogan-street, Pollokshaws; Messrs. R. S. M'Coll, Ltd., 142, North Woodside-road, to extend their premises there; De Luxe Picture House, Ltd., 38, Bath-street, to alter their premises at 417, Sauchiehall-street; Messrs. Thomas Melvin & Sons, Ltd., to make extensions to their engineering shop at Charles-street, St. Rollox.

Hitchin.—The U.D.C. has approved Mr. W. S. Dickinson's plans of a "portable" building, proposed for erection on the east side of Bancroft.

Hollingbourne.—The R.D.C. has approved plans of a new bungalow for Mr. J. H. Gibson, Headcorn, and of a bakery, cottage, new sawmill, and engine-house, for Mr. Drageas, Harrietsham.

Horbury.—Plans passed by the D.C.:—Saw shed at the Calder Grove paper works, for Messrs. C. Marsden & Sons, Ltd.; extensions to boilerhouse at the Albert Mills, for Messrs. R. Poppleton & Sons; office at Springend for Messrs. Jessop Bros.; additions to sub-station at the works of the Yorkshire Railway Waggon Company, Horbury Bridge; conversion of cottage in Barker-road, for Mrs. Hargreaves; and cottage at Back-lane, for Mrs. Ainsworth.

India.—A new palace is to be built for the Rajah of Dharakota at Dharakota, in the Ganjam district, from the designs of Mr. Stephen Wilkinson, architect, Calcutta.

Kirkburton.—At a recent meeting of the Kirkburton Council it was resolved that tenders be obtained for spraying the main road with prepared tar, and for 150 yds. of kerb to be delivered at Paddock for the footpath. Plans of a proposed dwelling-house and shop to be erected in North-road, Kirkburton, for Mr. W. Elliott, was approved.

Lincoln.—The City Council has passed plans of new buildings to be erected by Messrs. Clayton & Shuttleworth, Ltd., on the north side of the River Witham.

Luton.—The T.C. has passed the following plans:—Additions for Messrs. G. Kent, Ltd., Biscot-road, and Vauxhall Motors, Ltd., Kimpton-road; a motor garage and showrooms for Bates' Motor Works, Ltd., at Dunstable-road; and extensions and two chimney shafts at the works of the Thermo Electric Ore Reduction Corporation, Ltd., York-street.

Market Drayton.—The U.D.C. has accepted the tender of Mr. T. Healey for carrying out the construction of the cinema operating-room at the Town Hall.

Peterborough.—The C.C. has passed plans for the erection of forty-eight new houses in Thistlemoor-road and Durham-road, at New England.

Sturminster Newton (Dorset).—Sanction has been given to Mrs. W. H. Creech for structural alterations contemplated at the Baker's Arms Inn at Childe Okeford. Plans prepared by Mr. G. Hunt, architect, Blandford.

Sutton-in-Ashfield.—The U.D.C. has passed the following plans:—Joiner's shop in Fox-street, for Mr. A. Searson; stores at the Mason's Arms Inn, Eastfield-side, for Mr. G. R. Bailey.

Swindon.—The T.C. has approved the following plan:—Mr. J. J. Brown, corrugated-iron football dressing-room, rear of Lock House Cottage.

Tilbury.—The U.D.C. has adopted a report by their Surveyor on a town-planning scheme, and has asked the Clerk to obtain the approximate cost of the necessary expert evidence and advice, and bring these before the Town-Planning Committee.

Uxbridge.—The R.D.C. has accepted the tender of Mr. Filkins for the raising of the centre walls in the pump wells at Harefield new sewage scheme.

West Thurrock.—Messrs. E. N. Clifton & Sons have notified the Orsett R.D.C. that it is proposed to erect at West Thurrock a margarine factory for Messrs. Jingens & Co. The works would comprise a reinforced concrete structure with oil tanks and river wharf.

Weymouth.—Plans passed by the T.C.:—Submitted by Mr. S. Jackson, for motor garage, Cromwell-road, for Mr. R. F. Bugler; submitted by Mr. S. Jackson, for alterations to greenhouse, store, and cokehouse, at the rear of Dorset House, Chapelhay, for Mr. Benjamin Risley; submitted by Messrs. Jesty & Baker, for motor garage at end of stable yard, Spring-road.

Yiewsley.—The Public Health and Allotments Committee of the U.D.C. has instructed their inspector to interview the owner of Florence and Leonard Cottages, Horton-lane, with a view to repairs being carried out at an early date.

TRADE NEWS.

The extensions to Willerby Asylum, Hull, have been supplied with Shorland's special inlet and extract ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

Under the direction of Messrs. Sydney Mitchell & Wilson, architects, Edinburgh, the Boyle system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Hairmyres Sanatorium, Lanarkshire.

We learn that a tank on Lord Donoughmore's estate at Knocklofty, Clonmel, was constructed with Pudloed cement concrete two years ago. Upon recent examination it appears to be in a perfect condition. It had been subjected to a severe test in the interim.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3817. MARCH 31, 1916.

THE CITY COMPANIES.

THE origin of trade guilds dates from ancient times, and they have played no small part in the history of every European country as well as those of the Far East. The voluntary association of men of the same calling for the promotion of mon interests, for protection, and for the advancement of rafts was a vital matter in days when law was imperfectly inistered and when education was difficult to attain.

eader Scott, in his fascinating book, the "Cathedral ders," builds up a very plausible theory in support of the mption that the greatness of the mediæval architectural h in Europe was the result of the activity of the Comacine d of Master Masons, whose origin he traces back to the of ancient Rome; while tradition may link it up with the rior age in which Solomon built his Temple and with the tic order of Freemasons. The exact amount of truth and on on which learned theories of the subject are based t ever be a fertile ground for discussion and debate; but certain that from the early days of recorded history in and other lands the activities of the trade guilds ed an important element in our national life, and each of City Companies is a living strand connecting the present with the past. The growth and prosperity of London were d and increased by the activities of the guilds, to each of h important functions and duties were relegated, and the that they acquired wealth and influence and were ointed to administer bequests of property and money is a of the estimation in which they were regarded by our fathers.

The City guilds are divisible into two classes—those which rolled and largely directed commercial enterprise, such as Mercers, with the closely-allied associations of the Merchants he Staple and Merchant Adventurers, the Grocers, who d for centuries as public weighers for the Port of don, and also the associations which were more purely t guilds, like the Armourers and Braziers, the Goldsmiths, ksmiths, Carpenters, Joiners, Masons, Painters, Plumbers, Glaziers. In many instances the functions originally fulfilled the guilds have become obsolete, as is the case with the llers and Armourers, and such Companies have become ensers of educational and other benefits for the general ice of the community. In the case of the Barbers, whose tions up to the year 1745 included surgery, the scope of Company's activities have become altered by subdivision the formation of later associations. By similar processes paration was made between the Mercers and Haberdashers, Grocers and Apothecaries. Other of the Companies, such he Fishmongers, became divided into two Companies, which sequently were united again into one body.

The craft guilds sought to obtain as far as possible a nopoly of their crafts, excluding all who had not been nally admitted to them through the gate of a recognised renticeship, and they were assisted by law and common tom in maintaining such privileges. Thus we find the penters at dispute from time to time with the newer body oiners as to the limitations of their crafts, and their rights punishment against those who transgressed the rules laid n for the proper regulation of the various trades were n exercised.

In this respect the craft guilds resembled trade unions, but y combined with a sense of their rights and privileges a n determination to advance craftsmanship and technical wledge, their desire being to increase the importance of h craft to the body politic by maintaining a high standard of excellence, and insisting among themselves that their members should be what they professed to be—master craftsmen. They promoted the real dignity of labour by showing that the best results could alone be attained by practical technical skill—a result brought about by intelligent and well-directed work and not by agitation. Nor did they, like the unions, seek to regulate the rate of wages paid in their crafts.

The guilds are first mentioned in the reign of Henry I., though their history must extend to a much earlier date. Originally they had no official position, but were tolerated on the payment of an annual rent or "ferm" to the Crown. The oldest charter of incorporation given to any Company is that granted by Henry II. to the weavers, confirming privileges granted to them in the time of his grandfather in consideration of a yearly payment of two marks of gold. Practically all the guilds in the early period of their existence formed fraternities in connection with some religious body, and religious observances were closely associated with their history. It was, among other duties, an obligation laid on them to attend the funerals of members of their guilds and to maintain their own poor.

After their incorporation in the form of companies they gradually acquired lands and property, interesting themselves in the provision of means of education and building halls in which to meet and transact business. There are three degrees of members of a City Company—the possession of the Freedom, membership of what is called the Livery, and a position on the Governing Body entitled the Court of Assistants. The Liverymen of the companies become the electors of the Lord Mayor of the City Corporation and most of the officials of that body, proposing to the Court of Aldermen two aldermen, one of whom is chosen Lord Mayor by vote, and until the Reform Act of 1832 they had the exclusive right to vote in Parliamentary elections. Thus the association between the City and the City Companies has been a very close one, and, until the enormous growth of Outer London occurred during the last 150 years, the City of London constituted the metropolis, whose voice had such weight in all epochs of our national history. The espousal of the cause of popular liberties by the capital made the cause of those liberties prevail

The Government of England, under our earlier kings, frequently had recourse to the Companies when in need of money for the prosecution of foreign wars, and the abuse of the custom under the Tudors and Stuarts led to many grievous exactions by which the revenues of the Companies were sorely strained, these exactions reaching their climax in the reign of Charles II. That sovereign issued a writ of *quo warranto* in 1684 against all the Companies, which gave the Crown arbitrary and unconstitutional rights over their management and revenues, which was annulled and reversed in the reign of William III. The destruction caused by the Great Fire almost ruined many of the Companies, and it was only by prudence and effort that they were in time able to recover from the great financial loss which they had sustained. In 1880 it was estimated that the trust and corporate property of the Companies was between £750,000 and £800,000, of which sum about £200,000 was trust and the remainder corporate property. The trust property of the Company supports over 1,000 charities, and when an inquiry was held in 1882-83 it was stated that no charities were better administered.

Something like forty schools, many of them of the first importance, are also wholly or partially supported by the Companies, as well as the City and Guilds Institute at South Kensington and numerous scholarships at Oxford, Cambridge, and the newer universities. A great part of the income devoted to these and other purposes consists of contributions from the corporate funds of the Companies; in other words, from funds to the free use of which they have the same rights as that of a holder of private property, so that the effect of the Companies' activities is that large sums of money which would have to be raised by the community is saved to it by the voluntary action of these bodies.

As English law represents codified custom, and is slowly changed and altered from century to century by the recognition of the needs of the community, so the trade guilds, as represented by the City Companies, have become bodies carrying out their original purposes in ways suited to modern conditions, and it is more than possible that they may attain a greater position of authority in connection with the crafts they represent than they at present hold. The history of Japan furnishes such a parallel in the manner in which the Mikado once more became the real instead of the titular head of the State—by adapting his Government to modern conditions, and it may be that the City Companies will in the future obtain some of the authority which is now exercised by the trade unions, whose activities have in many respects failed by being political rather than technical.

It is interesting to note a few of the privileges and powers conferred on the Companies or at present exercised by them. The Fishmongers, relying on their charters, pay "fish meters," who attend Billingsgate Market, examine the fish there, and condemn any that is unsound. The Goldsmiths were until recently empowered to assay and mark plate, and to prosecute those selling it if under standard or forging marks. The freemen of the Vintners, by patrimony or apprenticeship, and their widows enjoy by custom the right to sell wine without licence on certain highways. The Vintners' and Dyers' Companies, together with the Crown, are joint protectors of the swans on the Thames. The Apothecaries have the rig to examine candidates who wish to practise as apothecarie and to recover penalties from those doing so without licenc The Founders' Company stamps weights under the provisio of several Acts of Parliament; the Gunmakers have powe to enforce the proving and marking of guns and pistols; t Scriveners conduct an examination for admission to the offi of notary, and can prevent anyone from practising who h not passed such an examination; and the Stationers ha kept a register of all publications since 1557, which is regard as legal evidence under the Copyright Act of 1842.

The Fire unfortunately cut the thread of the historic record of the Companies as far as it is architecturally express in their Livery Halls, which, with the exception of a fe fragments, date from the time of Charles II., and in many cas the immense pecuniary loss occasioned by "that dreadfu conflagration," as it was fittingly called, prevented t Companies from erecting buildings commensurate with the historical importance and influence. Like the churches London, they rose again from their ashes; like them the frequently show traces of the privation in which London w reborn. The later additions which have been made are n always in the best architectural taste, but they are an expressio of the æsthetic attitude of their day, and as such have a value.

We shall describe the twelve great Companies in the order of precedence, an order rigidly observed, though it do not necessarily depend on wealth or antiquity, and afterwar we shall hope to deal with the remaining Companies, many which possess halls of great architectural merit and all them buildings of interest from their historical and technic associations, for in the new England which will emerge fro the mists of war the City Companies have, we doubt not, great part to fill.

◆

NOTES.

Testimonies of Study at the R.I.B.A.

The current exhibition of Testimonies of Study now on view in the Common Room at the Institute shows the inevitable effects of the war. It is not particularly interesting, nor does it contain any work of so high a standard as some of the designs in previous exhibitions. But, as we have remarked before, the interest of these exhibitions would be considerably enhanced if marks were placed on the drawings showing those which were approved by the examiners and those which were rejected. The advantages of this suggestion appear to us to be obvious, and the only drawback we can imagine is that it might be thought somewhat unkind to draw public attention to those who had failed. But this difficulty might be avoided by placing the signatures of the students on the backs of the drawings instead of on the face, or, if preferred, those designs which failed could be taken down and the exhibition be confined to the successful ones. This, at any rate, would improve the standard of the exhibition. We suppose the Board of Examiners is the responsible authority, and we hope they will give this suggestion their kindly consideration.

Carpenters' Hall Lectures.

Mr. H. Hughes-Stanton, A.R.A., R.W.S., gave a very interesting lecture at Carpenters' Hall on Wednesday, March 22, on "Landscape Painting," in which he described the historical sequence of the various schools of landscape painters and the growth of the art from its tentative beginning in the form of backgrounds in the early Florentine figure pictures; but it was not, he said, until the Dutch specialised and the easel picture was encouraged that real landscape art arose. Landscape art being comparatively new, there is in it more room for progress than in other branches of painting, and effects of light and shade are now better understood and represented than they were formerly. We are too ready to accept fully-established art, which is why painters who have been dead for years are often considered great, while modern painters are undervalued. The Italian school produced no real landscape painters except Canaletto and Guardi, who devoted themselves to architectural subjects. The Flemish school gave the art new impetus, but Rubens may be considered as the first real painter of pure landscape. Claude Lorraine made himself an immortal name in France, and his art is based on classic feeling and a love for the great and lofty beauty of nature. The landscape school which arose in Holland in the seventeenth century carried the branch nearer to a true representation of nature. Its great charm is that in it nature was painted without any preconceived idea of making elaborate compositions; it is in the work of the Utrecht school that it finds its best and most complete expressio Van Goyen, the pupil of Van de Velde, may be considered to be th first of the great landscape painters. The lecturer reviewed the wor of the Ruysdaels which lead up to that of Hobbema who, though prize as the greatest Dutch landscape painter, owed his position to th fact that his work was lost in obscurity until rediscovered by appr ciative amateurs. The work of Albert Cuyp shows a first attem to obtain more truthful colouring. Rembrandt's contribution to th art was reviewed, while afterwards an interesting sketch was given English art as illustrated by Chrome, Cotman, Turner, and Constabl and a sketch of the development of the modern French scho followed. In conclusion, Mr. Stanton said that the work of man artists recently deceased have found places among the immortal instancing the work of the brothers Maris and Mauve in Holland an Boudin and Gazin in France, while in this country Cecil Lawson ha found a very high place. We think the lecturer was justified i claiming at the end of an admirable lecture that there are man living who are as sincere as any of the artists of the past, and wi leave the world a legacy of talent which will at a later date b appreciated at its true value.

"New" and "Temporary" Structures.

In our Law Reports will be found a report of th case Andrews *v.* Wirral Rural District Council, th facts of which are somewhat unusual, as will b n by a reference to the report. We only refe to the case here to draw attention to the point law decided by the Court of Appeal. The Council having pulle down the erection in question, were sued by the owner, who claime damages for its wrongful seizure and destruction. As a ne "building" the Council would have been entitled to pull down th structure under their by-laws made under the Public Health Act 1875, if it had been erected in violation of their by-laws, but thi defence was held both by the court below and the Court of Appea not to be open to them because they failed to show that notice ha been given to the plaintiff calling upon him to show cause under th by-law. The Council had, however, in their district adopted th Public Health Acts Amendment Act, 1907, and the Court of Appea held that the action of the Council could be justified under sect. 2 of this Act, which relates to "temporary buildings" which hav been erected without the approval, or not in conformity with th approval, of the local authority, and under which section the loca authority has powers to pull down and remove such structures. Th court below had held that a structure could not at the same tim be both a "new building" within the Public Health Act, 1875, and "temporaary building" under the Public Health Acts Amendmen Act, 1907, and the important point in the case is the decision of th Court of Appeal that a structure may answer both descriptions an be dealt with under either Act.

E LONDON CHURCHES F WREN AND LATER RCHITECTS OF THE ENAISSANCE.

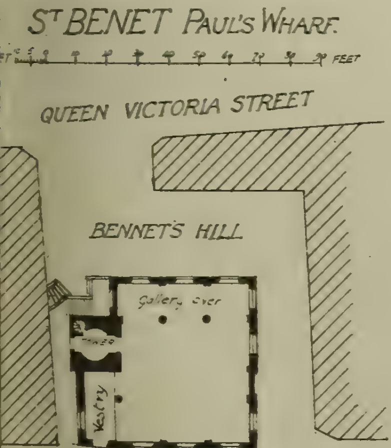
DWICK PUBLIC LECTURES, 1916:

CTURE II.—WATER SUPPLY AND DRAINAGE.

TINUING the series of lectures by Dr. es Porter, Medical Officer of Health, arylebone, at the Household and Social e Department, King's College for Women, den Hill-road, on Wednesday, March 22, The Arterial System of the House," the er devoted a considerable amount of time dicating the various defects that might in relation to the drainage system and the ge that might ensue as a result. Many of defects were caused by neglect, and many em were of so simple a nature that the holder could quite easily deal with them. appliances within the house and those ded for collecting and carrying off rain- were under the eye of the householder, because they were not looked at intelli- y, were not looked after properly, and ently were the source of dampness and troubles. With regard to the under- d drainage, he indicated that, though it be seriously out of order, no signs might iven. A defective drain was always a potential source of danger, and those who fussed about their drains, had them examined and cleaned and tested regularly, were perfectly justified. Certain of the tests were described and various appliances that might be used in remedying minor defects were demonstrated.



produced from the Ordnance Survey Plan, with the sanction of the Controller of H M. Stationery Office.)

The latter part of the lecture was devoted to a consideration of that portion of the arterial system connected with the supply of water, hot and cold. In indicating the main requirements of water companies in relation to water pipes and fittings, he drew attention to the fact that the chief responsibility for maintaining the purity of the water within the dwelling rested upon the householder. The Health authorities were given comparatively little power to deal with it. They asked little more than that the storage cistern should be kept covered and clean, while the water companies insisted chiefly that there should be no waste. The lecturer, while recommending regular cleansing of the cistern, advised that in every house there should be at least one tap drawing water direct from the main for drinking purposes. He expressed the view that in London and the larger centres there was no real necessity for domestic filtration of water. He showed a number of water fittings and described their structure and the defects that might arise in connection with them. In regard to hot water supply, he pointed out that, small as were the powers of the health authorities in relation to cold water, in respect of hot water they were much less. Entire dependence must be placed on those who fitted the system and the amount of care expended upon it by the householder. The different systems in common use were described, and particular attention directed to the various apparatus introduced with the object of getting rid of the necessity for depending upon the highly uneconomical kitchen range and boiler as the source of hot water for bath and other purposes.

◆

THE SURVEYORS' INSTITUTION.

The Council of the Surveyors' Institution has set up two strong committees to consider the problems likely to arise at the termination of the war, more particularly in connection with possible unemployment on the disbandment of the army and munition workers; and dealing with the question in the light of the special knowledge possessed by surveyors as distinct from other professional men or from the representatives of trade and industry, to suggest preventive or curative schemes. One committee will deal with the subject from the urban standpoint, and the other from that of the rural and agricultural districts; but arrangements have been made by which they will act together, either as a single committee or by means of joint sub-committees, where matters of general principle are involved.

SURVEYING, PAST AND PRESENT.

A Chadwick Lecture was delivered at the Royal Society of Arts on Monday afternoon by Mr. E. A. Reeves, F.R.A.S., F.R.G.S., whose subject was "Surveying, Past and Present." The lecturer devoted himself to the history of surveying, beginning with the voyage of Pytheas from Marseilles, round the coast of Spain and France to Holland and England, the maps of which, as drawn by him, were correct in some respects, but very inaccurate in others. The first recorded geodetic survey was made in the fourteenth century by measuring the difference in the angles of the shadow cast by the gnomon taken at Alexandria and Assouan, which were assumed to be on the same meridian, but are not, and multiplying the distance apart of the two places by the proportion between the angle differences, and thus obtaining the circumference of the earth.

The lecturer showed Ribero's map of Africa, 1529, and some Ptolemy maps, one of which, 1472, showed a large projection east of England which seemed to be Scotland twisted round. This was corrected in the edition of 1513. The first authentic map appeared late in the thirteenth century. The ancient instruments were then described, the principal one being the Astrograph, B.C. 150. This was retained in its original form until the Portuguese in the fifteenth century completely redesigned it. They also devised the Instrument in Parallaticum for taking altitudes.

Vasco di Gama did some original work, and in calculating latitudes seems to have been very nearly accurate. The lecturer had himself experimented with rough instruments and discovered that it was quite possible to reduce errors within five to seven minutes. The cross staff was invented in 1532, and used by John Davis in his work. The magnetic compass is known to have been used for measurement in the Mediterranean from the twelfth and thirteenth centuries, but not for land until the sixteenth. But it is to Philip Snell, of the Netherlands, in the seventeenth century that we owe the greatest advance, for he it was who first triangulated the ground and measured the base and containing angles to get his long measurements. This system has prevailed ever since, and has been adopted for all our Ordnance surveys and every important survey.

It is very interesting to notice how the old surveyors, while feeling their way in these difficult fields of research, often made guesses with no scientific basis which brought them very near the actual truth.

◆

ARCHITECTURAL SOCIETIES.

Nottingham and Derby Architectural Society.

On March 14 the fifth meeting of the session was held at the School of Art, Nottingham, when the Vice-President, Mr. H. G. Watkins, F.R.I.B.A., delivered a lecture on "Lincoln City and Cathedral" before a large audience, which included lady friends of the students of the School of Art, who had been specially invited. The President, Mr. Harry Gill, M.S.A., briefly introduced the lecturer, and Mr. Watkins, who is a Lincoln man, then gave an interesting description of his native city. He first described and illustrated with lantern views the supposed position and arrangement of the city in the time of the Romans, and then rapidly described its progress and alterations in Norman and later periods up to the present time. Views of the principal historical buildings and remains of old Lincoln were shown, and a concise history and development of the cathedral, usually called "The Minster," was given. A number of very beautiful slides of the interior and exterior were put on the screen, and even the history of the Lincoln Imp and his photograph were included. The interesting corporation plate was also described.—At the close Mr. Valentine Vaerwyck, a Belgian architect at present resident in Nottingham, proposed a vote of thanks to the lecturer, which Mr. C. B. Sherwin, a former Hon. Secretary of the Derby Society, seconded. Mr. Watkins suitably replied and seconded a vote of thanks proposed by the President that the thanks of the Society be accorded the Chairman and members of the Committee of the School of Art and Mr. Harrison and the members of the School for so kindly placing the room and lantern at their disposal.

Architectural Association of Ireland.

A discussion meeting was held on the 23rd inst. at which members were invited to present any "fads" as to forms of construction in detail, not of the stereotyped or conventional character, but variations which were found to be satisfactory in practice. The members who took part illustrated their views by blackboard sketches, and a most instructive discussion was thus generated. The designs submitted by Dublin architects in the competition in connection with additions to Louth County Hall will be on view until April 1 at the Association Rooms.

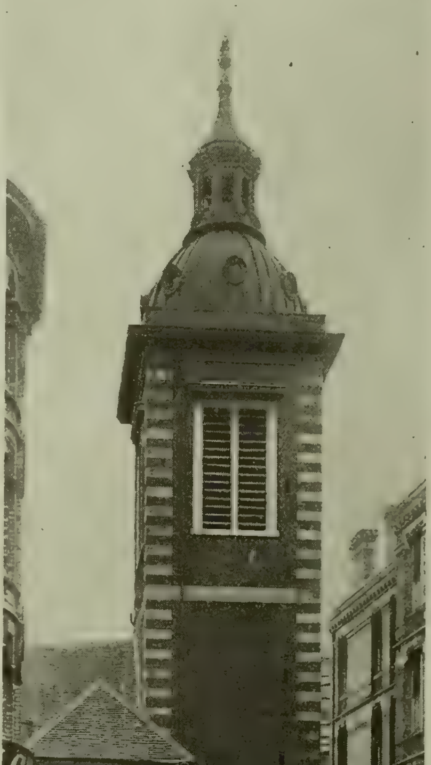
◆

CORRESPONDENCE.

By-Laws and Building After the War.

Sir,—In connection with the very urgent need that will exist for the resuscitation of building activity when peace is declared, to which frequent allusion has been made, may I be allowed to invite attention to the restraining influence which the by-laws of many of the local authorities cannot fail to exercise upon such resuscitation?

The well-being of a very large proportion of the population being dependent upon tl activity of the building trade renders it esse tial to remove every possible hindrance to immediate and widespread revival.



[Photo.: Geo. Trotman.

Wren's Churches: St. Benet. (*See page* 245.)

In the early Victorian days a demand aro for what the house agents now mouthing describe as rooms of "lofty elevation," an anyone questioning the justification for th so-called sanitary reformation was deeme hopelessly depraved.

The "hopelessly depraved" contended th the lofty room was difficult to heat, and for th reason its windows were rarely opened, whi low rooms ensured frequent if not consta open windows. Time rolled on, and wh does Suburbia now think of its lofty rooms?

In reply to my inquiry regarding the heig of rooms prescribed by the local authoriti the Local Government Board stated "th they are not aware that any return has be published showing the heights of rooms pr scribed by the by-laws of those local authoriti in England and Wales who have made by-lav on the subject.

The Board are aware that at one time number of local authorities were advised that requirement of a minimum height of 9 ft. w suitable for habitable rooms generally.

They have themselves been advised in mo recent years that 8 ft. may ordinarily be co sidered sufficient for enforcement und penalties; and this is the only standard whic has been specified in their model by-laws. Th have, however, been advised further that some localities where markedly urban co ditions prevail it may not be unreasonab to require a greater height, and therefore, wh it is their invariable practice to suggest a heig of 8 ft. to local authorities proposing to mal by-laws on the subject, they have in a fe instances felt that they would not be justifi in pressing that figure on local authorities who own advisers considered it inadequate for loc needs."

I should occupy too much of your space we I to demonstrate the absurdity of many of th existing local by-laws, but I ask to be allowe to give one illustration. An attic can generall be made to conform to the local regulation b converting that part of it which has a slopi roof into cupboards, thus reducing by possibl one-half the cubic contents of the room, and th really vital factor.

Matters of principle which would be dete mined by the imperial authority are left to th decision of local prejudice or ignorance. Th Local Government Board wastes time in givin advice which is not adopted, while th Imperial Parliament wrestles with som parochial problem with the merits of whic it is as conversant as with the geograph of the moon.

Has not decentralisation run mad?

W. Grey-Wilson.

Junior Carlton Club,
Pall Mall, S.W.

The Apprenticeship System.

Sir,—We are all agreed, I am sure, that th existing system is obsolete, and we woul welcome an alteration for the better; but, if w are to have any drastic changes, it will be mos useful to the reformers to receive opinion from all sides as to the reasons of failure o the present system.

My occupation is that of builder's foreman and, being a stonemason by trade, I will onl attempt to refer to this trade at present. have spent the greater part of my life on th very best work, both Classic and Gothic, an I can say with safety there is a great difficult in procuring masons who are thoroughl experienced in this class of work, where accurac and high finish are required.

The blame does not rest with them in ever case, as generally they take to this work wit enthusiasm when opportunity permits. O course, some are indifferent, but I think wher this is the case they have been apprentice to the wrong trade. Generally a lad doe not get any opportunity of selecting a trad upon which his future depends; he is as a rul put to the first trade which is open to hin that suits his parents' financial circumstances

If, as has been suggested in Mr. Costigan's letter, a partial training was commenced a ol, I believe it would do a great amount ood. A lad would be given some idea everal trades, and would have a better ce of choosing between them than at nt; he would also be taught the theoretical of his craft, which he seldom takes ntage of in our technical schools. Masons body do not realise the value of these ols.

e lack of opportunity to select a trade is eat drawback to a lad, as it often means misplaced for the whole of his life. I pleased to see that Mr. Stranks mentioned her serious point—that is, the difference e relationship between master and appren- In the old days they knew each other ately, and the employer took an interest e lad and personally tutored him; but in days of limited liability companies in cases we do not know who are our oyers.

nerally a lad is apprenticed after the of a month or so, during which time thing is strange and fascinating to him. s handed over to the foreman, who may ay not take an interest in him. If he does, ay possibly make him a competent banker n by the expiration of his time; but I end he should be taught to work hard and stone, fixing, and setting out. How often his done? Many firms turn lads away, their time is expired, who have worked ne kind of stone only, and, what is worse, hown by their own actions, by offering lower wages than the current rate, they not taught them that one branch properly five years' apprenticeship.

is generally accepted by masons that a as to knock about, as they call it, to make elf efficient, but I do not think this should ecessary to a lad apprenticed in a large .

hat I feel sure would be beneficial is some of supervision over the employer. For nce, I would suggest that every lad be ined periodically by competent people. is not progressing satisfactorily, and the oyer cannot give sufficient reason for backwardness, he should be transferred where.

a foreman looks after a lad properly it take up a lot of his time during working s, when he can ill spare it. I would suggest when a lad has completed his time, if he icient, and the employer has done well out im, he should receive a bonus out of the ium, and so should the responsible person has had charge of him, as an incentive oth of them to do their best. The employer ves the whole of it at present for doing ing; only in very rare instances could he ney teach the lad a trade, and in almost case a lad earns his money after the first months; at the end of the second year, I ure to say, if he is in proper hands and ted to the trade, he has earned much than he has received, even if he gets very al wages, and the material he spoils is a gible quantity. The last three years he earn more still in proportion to his wages; act the last year he should not be very behind the journeyman.

ere is a danger of a lad being kept on which he pays best on, however good or he is at his trade. A foreman has to get out at cutting prices, and in some cases ves commission on profits; apprentices be used unfairly where this occurs by g so treated, and so be unable to make the ress they should. This could be safeguarded nst by the periodical examinations I have dy suggested.

vas also pleased to see Mr. Stranks's reference e apprentice clauses in local rules,* and hope will be continued, as it would be disastrous he lad's future if an unlimited number of entices were turned out. What would he use of their knowledge if there was no and for their labour? This is a point h must not be overlooked, as, although e is a bigger demand for masonry to-day ever, less masons are employed. The nt of machinery and the revival of Classical itecture were responsible for this, and as hinery is further developed so labour must till further displaced.

After the depression of a few years since, when some of the best masons in London and elsewhere sold their homes and suffered privations, which they do not know how they survived, is it to be wondered at that they do not put their sons to the trade? Also competition is keener amongst contractors, which is bound to lower the standard of work. Masons who are old enough to have sons commencing work remember the time when they could take more pride in their work than they are generally allowed to now. The demand to-day is quantity rather than quality.

LAW REPORTS.

COURT OF APPEAL.

(Before the LORD CHIEF JUSTICE, Lord Justice WARRINGTON, and Mr. Justice SCRUTTON.)

Van as Dwelling-House and Bungalow: Andrews *v.* The Wirral District Council.

THIS case was heard on the 17th inst. upon the defendants' appeal from a judgment of Mr. Justice Atkin at the Liverpool Assizes in favour of the plaintiff for £20 for damage caused to an alleged bungalow erected at Moreton, Cheshire, of which the plaintiff was the owner, and also for trespass.

Mr. Rigby Swift, K.C., and Mr. Greaves Lord appeared for the appellant Council and the Surveyor, Mr. W. Webb Shenman, who was also a defendant; and Mr. Greer, K.C., and Mr. MacKasky for the respondent (the plaintiff).

Mr. Rigby Swift said the action was originally brought by Mr. Arthur Andrews against the Council and their Surveyor to recover damages for the removal of and the breaking up of a certain van belonging to Mr. Andrews on January 19, 1915. What Mr. Andrews called a van was really a building which had been removed as being in contravention of the by-laws, and which the Council were entitled to remove. Mr. Justice Atkin held that this erection was, in fact, a building within the meaning of the statute and by-laws, that the by-law in question was good, and that no needless damage was committed; but he went on to find that what had been done could only be justified under the by-laws, and that the Council had failed to give the notice required by the by-law before proceeding with the work of demolition, and that they were therefore liable for trespass, and he gave judgment for Mr. Andrews, the plaintiff, for £20.

The facts were these: Before 1914 a number of persons erected bungalows in various fields in Moreton for summer residences. The Council foresaw that these might cause a nuisance in certain circumstances, but they did not wish them to be removed at the time. Consequently they entered into an agreement with the owners of the land that they would not erect any more on the land, and would remove those already up if required to do so. As time went on the Council found they were becoming a nuisance, and, as some owners refused to remove the bungalows, an action was brought against them, which was tried before Mr. Justice Lush at Liverpool in 1914. His Lordship came to the conclusion that at that time no nuisance had been proved to exist, though it might; but he held that the agreement was void because it allowed the owners to do something in breach of the by-laws, and was therefore illegal. As a result the Council had to deal with each bungalow. The bungalow in question was erected in panels in Liverpool, and taken to Moreton and erected. His contention was that this was a temporary building, and should be so dealt with; but the other side did not admit it was a temporary building. Mr. W. R. Andrews, the then owner, was fined for not removing the bungalow in accordance with the request of the Council, and entered an appeal, but did not prosecute it. He then sold it to a Mr. Schofield, who was served with a notice to remove it. After this Mr. Schofield informed the Council that he had sold the bungalow to Mr. Arthur Andrews, a son of Mr. W. R. Andrews, who was a clerk in the employ of Mr. Schofield. In January, 1914, this gentleman was called upon to show cause why the bungalow should not be pulled down, and he attended the Council, who refused to allow the building, and then this gentleman put four wheels on the building and asserted that it was a van, and was therefore taken out of the by-laws. The building was removed by the Council, and Mr. Andrews brought the present action. Mr. Justice Atkin had found everything in the Council's favour except that the Council had not given Mr. W. R. Andrews notice. He (counsel) contended that there were admissions showing that Mr. W. R. Andrews had had notice, and, apart from this, he said it was a temporary building, which brought it within the Public Health Act Amendment Act, 1907, under which notice was not required to be given to Mr. W. R. Andrews, and that the building did not come under the Public Health Act, 1875, under which such a notice would be necessary. It was admitted that notice had been sent to Mr. W. R. Andrews by registered letter, but the learned Judge refused to accept secondary evidence of the contents of this letter, and that therefore the notice was not proved. He contended that the learned Judge was wrong.

Mr. Greer submitted that the judgment below was right on the grounds (1) that this was a new building within the terms of the Public Health Act, 1875; (2) that appellants had failed to prove their powers of demolition; (3) that they had no powers outside the by-law made under the Act of 1875, which by-law was bad; and (4) that the Acts of 1875 and 1907 must be read together, and once it was decided by the Judge that this was a new building under the former Act the 1907 Act did not apply.

The Lord Chief Justice, in giving judgment, said the learned Judge below was right in refusing to accept secondary evidence as to the notice to Mr. W. R. Andrews, but he was of opinion that the building in question was a temporary building, which came within the Amending Act of 1907, under which such notice was not required. He thought the Council were right in their action and the learned Judge below wrong upon this point, and his judgment must be reversed in favour of the appellants.

Lord Justice Warrington and Mr. Justice Scrutton also delivered judgment allowing the appeal, which was allowed, with costs.

(Before the MASTER OF THE ROLLS and Lords Justices PHILLIMORE and WARRINGTON.)

Allegation of Negligence against Civil Engineer. Successful Appeal: China Clay Corporation, Ltd. *v.* Worth.

THE hearing of this case concluded on the 9th inst., it being an appeal by the defendant, Mr. Richard Hansford Worth, a civil engineer, of George-street, Plymouth, from a judgment of Mr. Justice Scrutton in the King's Bench Division. (Reported in the *Builder* of May 21 and 28, 1915.)

The plaintiff Corporation was incorporated in January, 1910, to acquire leases and work clay properties near Harford, Devon, and they brought the action against Mr. Worth and a contractor of Plymouth, a Mr. William Caine Shaddock, to recover damages laid at between £10,000 and £11,000 for alleged breach of duty, breach of contract, and negligence in connection with the laying of a double line of 9-in. pipes about 3 miles in length from Redlake, Dartmoor, to Cantrell. They engaged Mr. Worth as the engineer, and under his advice and supervision Mr. Shaddock, as contractor, to construct the pipe line. There was to be a double line of pipes in a covered trench, and, it being of the greatest importance that the clay should be free from impurities, it was a term of the contract with Mr. Shaddock that the pipe line should be watertight, the pipe line being required to convey the china clay in solution from Dartmoor to Ivybridge, where the plaintiffs had railway sidings and tanks. Mr. Shaddock began his work in August, 1911, and in December, 1912, he was of opinion that he had practically completed it. But early in that month large quantities of water from the moor were found coming through the pipe line. Mr. Shaddock was called upon by Mr. Worth to make good the work under his obligation to make good any damage the works might sustain and maintain them in perfect repair for that month. He wrote letters which were interpreted as a refusal of this, and eventually the work was taken out of his hands. The plaintiffs then proceeded to have the trench reopened to ascertain the cause of the leakage A state of things was discovered which the experts interpreted in various ways.

Mr. Midgley Taylor, M.Inst.C.E., Westminster, said there were defects in the pipe line which, in his opinion, should never have occurred had the engineer exercised proper supervision of the work, and the presence of the clerk of the works would not absolve him from that responsibility. He also said that if there had been sufficiently frequent tests the quality of the work and the defects would have been revealed. Allegations were made that the leakages occurred through the pipes being improperly laid and the joints improperly caulked and bad cement used.

Mr. Worth's case, shortly, was that he had

---

ee letter in our issue for February 25, p. 157.—ED.

paid visits to the works on an average about once a month, and that he had every confidence in the clerk of the works and the resident engineer, Mr. F. S. Gould, and also in the contractor, who was a man of good repute. He said that tests were made from time to time, and any defects were remedied. Moreover, the resident engineer had made monthly reports, in which he stated that regular tests were applied. Mr. Shaddock's case, shortly, was that he had had no proper plans to work from, and that a great deal of the trouble was caused by the storm water, and that the leakage was caused by the cracks in the manufacture of the pipes. Mr. Justice Scrutton, after a trial which lasted thirteen days, held that Mr. Shaddock had been guilty of breach of contract, and gave judgment against him for damages to be assessed by an Official Referee. His Lordship also came to the conclusion that Mr. Worth had not given that amount of intelligent supervision, particularly on the question of testing, which he should have given, and gave judgment against him, also for damages to be assessed by an Official Referee; but he directed that, if the plaintiffs recovered from the contractor, the damages, which were for the expenses of repairing and included loss of profit, the damages against Mr. Worth would only be nominal. Mr. Shaddock did not appeal from the judgment of the learned Judge. Mr. Worth's appeal was upon the grounds that the finding of the learned Judge, that he had been guilty of negligently supervising the work, was against the weight of the evidence, and that the Judge had misdirected himself.

At the conclusion of the arguments, the Master of the Rolls, in giving judgment, said Mr. Worth's duty to the plaintiffs was that he should do the work that was entrusted to him with reasonable care and skill, according to the custom of his profession. It was a term of the contract with the contractor that the pipe line should be made watertight, because the presence of peaty water in the pipe line, which was of great length, would discolour the china clay and make it less valuable in the market. Tenders were applied for, and plans were prepared by Mr. Worth as the engineer; the plans were approved, and the contract was made between the plaintiffs and Mr. Shaddock. Mr. Shaddock was a local man, and had a good reputation at Plymouth, and there was no doubt that the directors and Mr. Worth believed that Mr. Shaddock was a competent, respectable, and trustworthy man to undertake work of that kind. By the contract there was a positive obligation on Mr. Shaddock to make the pipe line watertight within a certain number of months, and to guarantee that for several months after completion. The works were begun in August, 1911, and previous to that the plaintiffs had, in August, 1910, appointed Mr. Gould the resident engineer for the whole undertaking, the pipe line, and the railway alongside the pipe line. It was obvious that for work of that kind, in which watertightness was so necessary, it was of the greatest importance, not merely for a resident engineer to be on the spot, but also that there should be a clerk of the works, and a Mr. Rowe was appointed to that position. Both those persons were regarded as competent persons, and, so far as Mr. Worth knew, they were proper persons to discharge the duties entrusted to them. There was no doubt that Mr. Rowe was a fit and proper person to be appointed clerk of the works for a pipe line. He was to be at the works all day and every day. It had appeared that Mr. Gould had spent the greater part of his time on the pipe line. The work went on until about the beginning of December, 1912, and then it was discovered that the pipe line, instead of being watertight, let a great volume of water down it. It was a regular stream of water. Mr. Shaddock was called upon to make it good. He denied his liability, and then the plaintiffs took upon themselves to make the work good and so minimise the damage caused by the breach of contract by Mr. Shaddock. The plaintiffs had some of the work reopened up and then serious defects were found in the joints connecting the pipes one with another. The plaintiffs subsequently became dissatisfied with Mr. Worth, and then they got the report of Mr. Midgley Taylor, and later the present action was brought against Mr. Shaddock and Mr. Worth. He had very great sympathy with the company in this case. The company required for the purpose of their undertaking a watertight pipe line, and they found that what they had got was almost a sieve. The company had a remedy, so far as Mr. Shaddock was concerned. But because the company could not get the fruits of their judgment against Mr. Shaddock that ought not to induce the Court, out of sympathy for the plaintiffs, to saddle Mr. Worth with liability unless he had been guilty of not exercising reasonable care and skill, and that omission was the cause of the damage the plaintiffs had suffered. The question was not whether more precautions ought not to have been taken and being wise after the event, but whether there was any actionable negligence. Mr. Justice Scrutton had relieved Mr. Worth from all responsibility on many of the allegations made against him; but he had found that Mr. Worth had not tested the pipe line sufficiently to see if it was watertight. His judgment was based upon the testing. What they had to ask themselves was what were the duties of an engineer in such a matter as this? They had had the evidence of the very highest men in the engineering profession, and they had given evidence which satisfied him of this, that when work was entrusted to a contractor and there was a resident engineer there, and also a clerk of the works, who devoted his whole time to the work, it was not the duty of the chief engineer to examine minutely the whole of the details of the work. He had the right to expect that the persons appointed by the building owner would do their work properly and report any defect in the work to him. Of course, if he had any ground for suspicion that the contractor was not doing the work he had contracted to do, then he must take upon himself to check the work and satisfy himself that the resident engineer and the clerk of the works had done their duty. The evidence satisfied him that that in substance was the duty of the chief engineer. He thought it would be wrong to say that Mr. Worth ought to be held liable in the circumstances. He felt unable to agree with the view taken by Mr. Justice Scrutton. He could not bring himself to think that there was any liability on Mr. Worth, so far as the absence of satisfactory tests was concerned. They could not impose liability upon Mr. Worth unless it could be shown that he was given ground for suspicion. That being so he thought the judgment of Mr. Justice Scrutton on the main issue ought to be reversed. There was, however, a rather trivial matter upon which the learned Judge had found that as to one of three bridges or piers the cement used was mere rotten stuff, and that that was a matter which Mr. Worth must have seen and which he ought to have required to be replaced. He (his Lordship) was not prepared to say that he should have come to the same conclusion upon the evidence, but he was not prepared to differ from the Judge on a matter of that kind. He thought, however, that liberal justice would be done to the plaintiffs if Mr. Worth was held liable in that regard to the extent of £50, which would include any sum for costs, and those costs would be set off against the other costs. To that extent Mr. Worth's appeal would be allowed, with costs.

Lord Justice Phillimore delivered a judgment dissenting, and in the main agreeing with the judgment of Mr. Justice Scrutton.

Lord Justice Warrington delivered a judgment agreeing with that of the Master of the Rolls, and by a majority of the Court therefore the appeal was allowed, with costs.

(Before the MASTER OF THE ROLLS, Lord Justice PHILLIMORE, and Mr. Justice SARGANT.)

Plumber's Mate's Claim under Workmen's Compensation Act against Builders:

Dennis *v.* A. J. White & Co.

THIS case was heard on the 16th inst. upon the appeal of the applicant from the award of Judge Woodfall, sitting at the Westminster County Court, as the arbitrator under the provisions of the Workmen's Compensation Act in favour of the respondents (the employers).

It appeared that the applicant, Alfred James Dennis, of 13, Peabody-avenue, Pimlico, was, at the time of the accident in respect of which compensation was claimed, employed by the respondents, a firm of builders, of Coburg-row, Westminster, as plumber's mate. On August 27 last year Dennis alleged that in the course of his employment he was riding a bicycle in Sloane-square when a motor-car collided with him, with the result that he sustained a compound fracture of the leg. Judge Woodfall, however, held that the accident did not arise out of and in the course of Dennis's employment, and upon that ground he made his award in favour of the respondents. From this decision Dennis now appealed.

At the conclusion of the arguments, the Master of the Rolls, in giving judgment, said in his opinion the appeal failed. He thought the question for decision was wheth accident to the applicant arose out employment or whether it did not. arbitrator was the person to whom that q of fact was left, and his Lordship saw n direction on his part in his finding o The proper test to be applied in arriv a decision upon the words "arising o was to consider whether the risk was rea incidental to the employment. A deci the House of Lords bound that Court t that a decision of a lower Court must be upon a question of fact, if there was ev to support that finding.

Lord Justice Phillimore concurred judgment of the Master of the Rolls.

Mr. Justice Sargant, however, dissente thought that they had to look at th of the present case somewhat carefull applicant was employed by builders, a was employed habitually once a day u bicycle belonging to the firm to get m for the business of the firm. Whilst e on that business in Sloane-square h knocked down by a motor-car and i and the question was whether that a occurred in the course of the app employment and arose out of his emplo The question was whether the applic doing that and riding a bicycle, ran a risk than ordinary members of the publ The point was whether there was an danger to applicant on being asked to bicycle once a day on the firm's business streets of London. It seemed to his L that if one case had to be compare another that the extra danger whi applicant ran in riding a bicycle throu streets of London was much greater th risk incurred by the applicant in th known lightning case. But, however that be, the question in each case was simpl solely one to be judged by the facts c case. He thought that any ordinary m of the public would be startled to h said that a person who had to ride a through the streets of London did not some greater risk than other members public did. Upon the second point. whether it was a question of fact for the C Court Judge, or a question of law, or w it was a mixed question of fact and law, the greatest difficulty. However, in view opinion of the other members of the Cou became unimportant.

The appeal therefore was dismissed.

It is understood that the case will pr be taken to the House of Lords.

OBITUARY.

Mr. F. W. Lacey.

The death took place on the 24th in Bournemouth, after a short illness, o F. W. Lacey, who had been Borough En for over a quarter of a century, and des many public improvements, including Municipal College, the Law Courts, Unde Drive, and the Marine Parades. He responsible for the tramways throughou borough, and one of his last schemes design for the proposed new Pavilion.

Mr. C. Hadfield.

We hear with regret of the death of Mr. C Hadfield, architect, of Sheffield. He h singularly well-informed knowledge of She where he had spent the whole of his life. shall give some notes of his career next

ENERAL NEWS.

Westminster Hall.

n the House of Commons last week Harcourt, in reply to Sir W. Essex, who d in what state relative to the whole under- ng was the work now in progress in the of Westminster Hall, said, "The position he works of preservation is as follows:— truss has been completely reinforced and ed up with new oak; it has also been treated n preservative. One truss has been half- pleted as in the preceding case. Two other ses have been shored up and the steelwork n preparation for fixing at an early date. other trusses have been partly shored up. flèche is nearly completed and ready for ng. A considerable amount of preliminary k has been done, such as the ordering of the selection and ordering of slates; and two steel stages for shoring up all the trusses dealt with are complete. Thirteen trusses ll have to be dealt with. No date can be n for completion."

Charing Cross Bridge.

n the House of Lords on Wednesday last k the adjourned motion for the Second ding of the South-Eastern and London, tham, and Dover Railway Bill was agreed The Earl of Plymouth moved an instruc- to the Committee to whom the Bill will referred to take into consideration the uirements of the traffic over the river at ring Cross and the effect which the Bill have upon them, and to hear evidence n the Royal Institute of British Architects, London Society, and others on the treat- t generally of the very important part of ndon affected.—Viscount Chilston, on behalf the promoters of the Bill, said they would come any assistance which could be given m in beautifying the structure. He pointed that the present bridge was for railway and passenger traffic only, and suggested that authorise the construction of a bridge for ffic of all kinds would be beyond the scope he measure.—The instruction was agreed to.

Rebuilding the Countryside.

he Lord Mayor (Sir Charles C. Wakefield) sided at the Mansion House on Wednesday week over a public meeting called by the rden Cities and Town Planning Association discuss the Report of the Departmental nmittee on Land Settlement for discharged liers and sailors. The Earl of Selborne d that the Report of the Departmental nmittee was now under the consideration the Government. It was proposed by the nmittee to establish certain colonies—in the t place three pioneer colonies—which would experimental. If that experiment were cessful then no doubt those colonies would ome the model for imitation on a large le. It would be impossible to place at ce in the position of owner men with no icultural experience. He agreed that if Board of Agriculture was given the task must keep the land from which the pioneer onies were formed in its own hands, but s policy could only be adopted as part of much larger policy—the rebuilding of the ntryside. A suggestion had been made working the land through limited liability npanies. He could not conceive a more palling social calamity than that the land ould be industrialised in that sense. The roduction of a certain number of such dertakings might be of advantage. But he oked forward, both for social and economic asons, to the multiplication of the number people owning land, whether large farmers small owners.—Mr. W. H. Draper moved a solution welcoming the Report of the Depart- ental Committee on Land Settlement in ngland and Wales for discharged sailors d soldiers, and urging upon the Government e necessity for a speedy application of the oposals set forth. It further commended the notice of the Board of Agriculture and e Departmental Committee the suggestions ade in the Report of the Association. This as seconded by Mr. W. R. Davidge and proved.

The Royal Academy Exhibition.

We understand that the Royal Academy banquet, which is usually held on the eve of the exhibition, will not be given this year. There was no banquet last year. The exhibition will open on Monday, May 1, and close on Monday, August 7.

War Memorials.

With reference to the Patronal Window at St. Kenelm's Chapel, Clent, which was described in our issue of March 17 as the first war memorial, we are informed by Messrs. Morris & Sons, Ltd., 239, Kennington-road, S.E., that they painted a window to the memory of the men who went down in the *Formidable*, which was erected by them at St. Mark's Church, Portsmouth, in July of last year.

Housing of the Working Classes.

The Local Government Board has issued its Report for 1914–15 on matters incidental to the administration of the Housing of the Working Classes Acts and of the Housing, Town Planning, etc., Act. Dealing with the progress of schemes for the provision of working-class dwellings, the Report states:—"The sum total of the loans sanctioned by us during the year for this purpose under Part III. of the Housing of the Working Classes Act, 1890, was £1,125,176, of which £862,441 was sanctioned to urban authorities and £262,735 to rural authorities, the bulk of this sum being sanctioned in the first half of the year. The total exceeds by £365,736, or nearly 50 per cent., the total sanctioned for the same purpose in the year 1913–14, which was itself far in advance of the amount sanctioned in any previous year, and the sum included in this total in respect of loans to rural authorities exceeds the previous highest record by £69,155, or nearly 36 per cent. Only £460,609, or little more than two-fifths of the total of £1,125,176, was sanctioned in the latter half of the year, and of this sum only a very small proportion has been or will be allowed to be raised during the currency of the war." The Report adds:—"Shortly after the outbreak of the war we issued a circular to local authorities, urging them to prepare schemes for the provision of working-class dwellings in anticipation of possible unemployment, and it may here be mentioned that at the end of the year to which this Report relates we had before us no less than sixty-six schemes for the provision of some 4,120 houses by urban authorities and sixty-eight schemes for the provision of some 570 houses by rural authorities.

Industrial Research.

In the course of an address on "The Industrial Outlook and its Relation to the Gas Industry," delivered on March 29 at the eleventh annual meeting of the Society of British Gas Industries, Mr. Horace Moore Thornton, J.P., the Chairman of the Council, referred to the interesting and profitable scheme of industrial research scholarships now in operation in the Universities of Pittsburg and Kansas. He said: "Men who have graduated with distinction and exhibited capacity for original research are nominated by the University as Research Fellows. Manufacturers who are concerned with scientific processes are invited to state, in strict confidence and in detail, to the University certain particular scientific difficulties or problems in their work which they wish solved. They then enter into a contract with the University to pay for a defined time the stipend of a Research Fellow and certain fees, and to give a bonus or royalty to the investigator if the problem is satisfactorily solved. The Fellow, on his part, binds himself by contract to secrecy, undertakes to apply for patents, if required, on behalf of his employers, and enters into certain other covenants. In this manner the interests of all parties are united. The manufacturer has placed at his command the resources of University laboratories and libraries; and his expenditure is strictly limited. The investigator has an inducement to do his best and a stimulus to diligence and preservation of reputation. The University is benefited, and in many cases, as an indirect outcome of the solution of commercial problems, valuable contributions to pure scientific knowledge are obtained. The Research Fellows gradually gain experience in industrial research which makes their work progressively valuable."

Town-Planning in South Yorkshire.

A general meeting of the North-Eastern District of the Institution of Municipal and County Engineers was held at the Union Offices, Doncaster, recently. Mr. J. P. Wakeford (City Engineer of Wakefield) presided over an attendance of about forty members from various parts of Yorkshire and the adjoining counties. A paper on "Town Planning, with Special Reference to the Doncaster District," was read by Mr. Percy Morris, Town Planning Surveyor to the Doncaster Rural District Council. The author dealt with what had been done in regard to town Planning in the Doncaster area, where, he said, the Rural Council had under consideration schemes covering an area of 13,290 acres, divided into the Askern, Carcroft, and Armthorpe areas. These schemes had only reached the preliminary stage of preparation, with the exception perhaps of the Askern area, which was in a more advanced stage.

Organised Science.

A conference convened by the President and Council of the Royal Society was held at Burlington House recently to consider the desirability of establishing a Conjoint Board of Scientific Societies to organise scientific effort in this country. The following resolution was passed unanimously, and a committee was appointed to draft a scheme for giving effect to the resolution and to report thereon to a future meeting, viz., this meeting considers that it is desirable to establish a Conjoint Board of Scientific Societies for the purpose of (1) promoting the co-operation of those interested in pure or applied science; (2) supplying a means by which the scientific opinion of the country may, on matters relating to science, industry, and education, find effective expression; (3) taking such action as may be necessary to promote the application of science to our industries and to the service of the nation; (4) discussing scientific questions in which international co-operation seems advisable.

An Architect's Bequests.

Lieut.-Colonel Henry L. Florence, V.D., who recently died at Bath, in his seventy-third year, leaving estate of the gross value of over £300,000, has bequeathed valuable works of art to the National Gallery, the Victoria and Albert Museum, and the Dulwich Gallery, besides leaving legacies to several London hospitals and other institutions. He has bequeathed to the Trustees of the National Gallery the marble group "Maternité," by Dalou; and the pictures "Greenwich Hospital," by James Holland; "Deauville," by Eugene Boudin; and "Mousetrap," by P. Van der Werff. The Trustees of the National Gallery are also empowered to select any other of his pictures which they consider worthy of a place in the national collection; and it is stated that sixteen pictures have been handed over by the executors for this purpose. It is stipulated that the marble group and the pictures given and to be selected are to be permanently exhibited in the National Gallery and are to be collected and known as "The Henry L. Florence Bequest." To the Victoria and Albert Museum Colonel Florence left such remainder of his pictures, bronzes, enamels, furniture, and objects and articles of art and vertu as may be selected by the trustees or by the committee or a director appointed for the purpose. He asks that these should be as far as possible grouped and permanently exhibited and be called "The Henry L. Florence Bequest." Snyder's "Fox and Poultry" is given to the Dulwich College Picture Gallery. The following legacies are also left by Colonel Florence's will:—National Gallery, St. Bartholomew's Hospital, and Charing Cross Hospital, £10,000 each; British Museum, £1,000; Foundling Hospital, £250; Architectural Association, £1,000; and, for founding an annual prize, another £1,000. To the Haberdashers' Company, of which he was a former Master, Colonel Florence left £3,000. The residue of the estate, subject to two life interests, amounting to something under £100,000, is to be divided equally between St. Bartholomew's Hospital, Charing Cross Hospital, the National Gallery, and a number of other hospitals and museums, including the British Museum. Mr. Herbert Wykeham Lydall, solicitor, of John-street, Bedford-row, and Mr. Alfred Cox, architect, are the executors.

BOOK RECEIVED.

GUIDE TO THE INCOME TAX. By F. B. LEEMING. (London: Effingham Wilson. 2s. 6d. net.)

◆

SOME MANCHESTER SKETCHES.

The notes accompanying the sketches of some Manchester buildings in last week's *Builder* were taken largely from Mr. A. E. Richardson's book, "Monumental Classic Architecture in Great Britain and Ireland." Mr. Gordon Hemm wishes to express his sincere apologies to the author for having unintentionally omitted to state the source of his information.

BOOKS.

The Reinforced Concrete Regulations of the London County Council, with Explanatory Notes, by EWART S. ANDREWS, B.Sc. (London B. T. Batsford, Ltd. Price 2s. 6d. net.)

THIS book will be very useful to architects and engineers in the design of reinforced concrete, as the full text of the Regulations which are now in force is given, with portions of special importance printed in heavy type to facilitate reference. It behoves all those engaged in London work to study these Regulations and possess a copy for reference when designing, and in the volume it is a distinct advantage to have explanatory notes which deal with the important points. The notes are given in a separate section at the end, and the section of the regulation is clearly given in each case, so that the reader can quickly refer from one portion of the book to the other. Various numerical examples are worked out to show the application and effect of the Regulations, and these will be useful to many readers. We notice a small error in one of these on page 64, where, in dealing with the example of a column, the safe load is given as equal to ·49 × 66,400 lb., whereas it should be ·49 × 166,000 lb. As the result is given correctly, however, this is obviously a printer's error. The book, which is a convenient size, should have a good sale.

Bridge Foundations. By WM. BURNSIDE, Assoc.M.Inst.C.E. (London: Scott, Greenwood, & Son. Price 4s. net.)

THIS volume is one of the Broadway Series of Engineering Handbooks, and it is intended only as an introduction to the subject of bridge foundations. The work included is only that in connection with bridges crossing rivers or other waters—that is to say, to foundations which are wholly or in part subaqueous. The matter described includes the foundation bed, abutment, and pier foundations, dams, piles, and caissons.

The author considers that much might be done towards standardising the practice in design, and with this we agree. It is true that a special joint committee have been dealing with the question of loads on highway bridges, and the Report was submitted at a meeting of the Concrete Institute, held recently; but a great deal remains to be done before bridge design can be considered as being based on any kind of standard in this country. The various sections of the volume are described in a simple manner, and illustrations and examples from actual practice are included when possible to show the application of different types of work. A particularly useful portion of the book is that devoted to pneumatic caissons, as this class of work is of great importance to engineers, and it is seldom described in such an interesting manner as is the case here. Methods for adjusting caissons in position and the effects of compressed air are dealt with, and some good general information is given. The concluding chapter is devoted to a brief explanation of pontoon and other types not considered in the general notes, and various useful tables are attached at the end of the volume. The book is well arranged and produced.

Limes and Cements. By ERNEST A. DANCASTER, B.Sc. (London: Crosby Lockwood & Son. Price 5s. net.)

THIS is an elementary treatise describing the nature, manufacture, and use of the different classes of limes and cements, and the information contained therein should form an excellent basis for a more advanced study of the subject. The scope of the book is more extensive than the title suggests, as the author includes chapters on Mortars, Concrete, Plastering, and Stuccos in addition to the matter devoted to Limes and Cements. The chemistry and classification of limes are first described and the process of manufacture explained, and these notes are followed by a chapter on Artificial Limes and Cements. The most important section of the book, however, is that which deals with Portland Cement, and the chapter under the heading covers over forty pages.
The author has fully realised the great in
ance of Portland cement in modern bu
work, and he has obviously spared no tr
to make the chapter comprehensive.
manufacture is fully described, with illustra
of kilns, grinding mills, and other plant
the various constituents are considere

No. 1.

The Mercers' Company.

Mercers' Company takes precedence
nong the twelve greater Livery
ompanies, and its history stretches
many centuries. The first record
nce of the association which after-
came the Mercers' Company is con-
the copy of a grant dating from
year 1190, in which Thomas de Helles
s his wife, who was a sister of Arch-
ecket, bequeathed to the brethren
omas the Martyr of Acon a piece of
erly belonging to Gilbert Becket, in
t they might build a church thereon;
raternity of Mercers were constituted
f the brethren's hospital, an association
ed up to the period of the Reformation.
ginal derivation of the term Mercer is
but it was probably derived from the
rcator, through the French *mercier*.
re formerly two divisions in the trade,
staple" and "miscellaneous," known
date as mercery, and when silk was
rted it fell under the last heading,
term "silk mercer." Woollen cloths

r-lane on the west, and by a tenement
"Mitre" on the east.
ital shared the fate of other religious
l was surrendered to Henry VIII. in
King by letters patent granted the
in 1541 the hospital church and
ereof, together with the rectory and church of St. Mary Colechurch, for the sum of £969 17s. 6d., the purchase-money being fixed by the Crown, as in similar cases, at twenty years' purchase of the annual value. The Company, by a separate deed, signed on the same day, covenanted to find three priests to sing and say masses and to celebrate divine service for the King and his successors in the church of the hospital (called the Mercers' Church), and to keep a free grammar school within the City of London in perpetuity, appointing a "sufficient" master to teach twenty-five children and scholars, and also to provide learned men to preach in the Mercers' Church. They subsequently acquired houses in the parishes of St. Stephen, Walbrook, and St. Stephen, Coleman-street, by purchase, their property in the parishes of St. Mary and St. Martin extending from the corner of Frederick-place to Cheapside, along that street to Ironmonger-lane, and northward along the lane for 140 ft. with the exception of a house at the corner of Ironmonger-lane, belonging to Elsyng Spital, which was purchased during the last century.

The church extended from the east of the present chapel to the west side of the ambulatory under the hall, and was about 140 ft. long by 40 ft. broad. It was a building with aisles and chapels rich in monuments, which all perished in the Fire, excepting that of Sir Richard Fishbourne. The Mercers' former chapel was, after the purchase of the hospital church, altered and let out as shops and used for their school.

Queen Elizabeth is said to have been a free Sister of the Company; she was descended from Sir Geoffry Boleyn, who was admitted free by redemption in 1435, and on July 26, 1560, the Court of Assistants hastily assembled on a rumour that the Queen was coming to the Mercers' supper on the following day. A message from Sir Thomas Gresham, then Master, was received, stating that the Queen was actually coming. After all preparations were made Sir Thomas sent word that the Queen had changed her mind, so the Company had to console themselves with entertaining the Lord Treasurer and other noblemen. Sir Thomas Gresham "was to be spoken to, and most of the charge laid on him," as he was "the beginner and doer of all this."

Mercers' Church was celebrated for the Italian and Spanish sermons which were preached there for the benefit of Italian and Spanish Protestants in London, and bequests were made from time to time for special sermons to be preached. In 1615 the Master and Fellows of St. Catherine Hall, Cambridge, covenanted to find a learned divine to preach in the church once a year for ever, and this sermon is now still given every Good Friday, while Paul Birkenhead gave the Company £100 in trust to pay for the maintenance of two sermons at Mercers' Chapel on the anniversaries of the death of Charles I. and the restoration of Charles II. In 1645 the Company agreed to lend their church and Hall for the use of the House of Commons for a solemn thanksgiving after the battle of Naseby, and soon after they petitioned Cromwell against the quartering of soldiers in their hall.

The fraternity of St. Thomas à Becket of Canterbury, which was afterwards known as the Company of Merchant Adventurers, originated in an association by members of the Mercers' Company to promote foreign trading, and had their first charter granted them by Edward I. in 1296. They gradually became detached from the Mercers' Company during the fifteenth century, and were constituted a distinct company in 1594 by Queen Elizabeth. The Merchants of the Staple were a body of great antiquity, and are believed to be an offshoot of the Mercers. They obtained charters from Edward II. in 1313 and 1320, prohibiting the export of woolfels, except through one certain Staple (established mart) in the Netherlands. In 1325 the Staple was fixed at Bruges on the prayer of the citizens of Bruges, Ghent, and Ypres, in which cities the merchants traded. They were controlled by the Mayor of the Staple, and dealt with the staple or chief products of the country, which were sold in the "Staple" towns. The proceedings of the body were regulated by Acts of Parliament, and in the twenty-seventh year of Edward III. an Act was passed to remove the Staple then held at Calais to towns in England, Wales, and Ireland.

The Mercers' Company resigned foreign trade to the Merchants of the Staple and the Merchant Adventurers in the fourteenth and fifteenth centuries, home trade in woollen goods to the Drapers at the end of the fourteenth century, and retail trade to the Haberdashers about the same time or a little later; but the minutes of the English branch of the Adventurers were kept in the Mercers' books down to the time of the Great Fire, and the Merchant Adventurers had a room in the Company's premises for the transaction of their business.

The Mercers' have received numerous charters, the earliest from Richard II. in 1393-94, in which for a fine of 100 marks he granted "to the said liegemen of the aforesaid mistery from thenceforth to have a perpetual commonalty of themselves, and that the same commonalty might be able every year to elect and make four wardens out of the same commonalty and mistery to oversee, rule, and govern the mistery and commonalty aforesaid, and all the men, persons, and affairs of the same for ever." They were given powers to purchase land, tenements, and rents, to be held in support of the poor men of such commonalty or mistery, as of a chaplain to celebrate divine service perpetually for the King and the Queen, and the father and mother of the King, and for the estate and souls of the men of the same commonalty or mistery. Further charters were granted by Henry VI., Edward IV., Philip and Mary, James I., and Charles II., who abridged the rights granted under former charters, but by an Act under William and Mary their former rights were restored to the City and Livery Companies.

The Company's arms were granted in 1568, and confirmed in 1634. Doubts having arisen as to their correct form, the following arms were confirmed to them, and are thus described: "Gules issuant from a bank of clouds, a figure of the Virgin, couped at the shoulders proper, vested in a silver robe adorned with gold, the neck encircled by a jewelled necklace, crined or, and wreathed about the temples with a chaplet of roses alternately argent and of the first, and crowned with a celestial crown, the whole within a border of clouds also proper, and for a crest on a wreath of the colours issuant from a bank of clouds proper, a figure of the Virgin as in the arms." The Virgin in the crest and seal is always referred to as a maidenhead, and there does not seem to be any authority for regarding it as a representation of the Virgin Mary, though the dedication of the hospital of St. Thomas was "in honour of Almighty God and of the blessed Virgin Mary, His Mother, and the most glorious Martyr St. Thomas à Beckett."

In the Great Fire Mercers' Hall perished, and the Company had to undertake the rebuilding of the Royal Exchange, which had come into their possession, together with Gresham's House in Bishopsgate-street in 1596 on the death of Lady Gresham, as well as St. Paul's and Mercers' Schools, their chapel hall and offices. The hall and offices, which form the oldest part of the present buildings, were carried out from the designs of Edward Jerman, surveyor to the Company, and were completed by John Oliver, who succeeded him. The principal parts of this building which remain are the ambulatory and chapel on the ground floor, and the hall and large court-room on the first floor.

The chapel is a square room with gallery lighted into areas on either side by windows. Most of the old fittings were re-used in it. The ambulatory suffers from the absence of light, the windows looking into a narrow space on one side, which is the more unfortunate as it would otherwise convey a great sense of space and dignity. It seems a pity that in the reconstruction of the part of the building facing Cheapside it was not found possible to open it out by making the great staircase open directly out of it with ample top light. The Hall is a finely-proportioned room, very handsomely panelled in oak, with a fine gallery at one end, and a well-designed ceiling, and is lighted over the top of panelling by mullioned windows on either side. The general court-room is dignified and happy in its proportions, and the character of its detail is refined and pleasing. On its walls are fine portraits, one of Sir Thomas Gresham, attributed to Holbein, a portrait of Dean Colet, a second portrait of Sir Thomas Gresham, and other interesting pictures, including an apocryphal portrait of Sir Richard Whittington. The front part of the present building was carried out in 1878 by the Company's surveyor, Barnes Williams; it includes shops facing Cheapside and Ironmonger-lane, a central entrance and grand staircase, which is also approached from the ambulatory, and a drawing-room occupying the central position of the Cheapside front on the first floor. It is a characteristic example of the work of an epoch when the distinctive purpose to which a building was to be put was usually under-emphasised, and when our buildings were somewhat lacking in character; but the problem of arranging a combination of commercial premises with one of the oldest and most historical of the Livery Companies' halls was an unusually difficult one. The staircase, carried out in oak, is ample in size and convenient in arrangement, giving a suitably important approach to the Hall and reception-rooms over.

Between Ironmonger-lane and Fredericks-place, Old Jewry, a second addition in the shape of the provision of new offices for the clerk and surveyor was carried out by the present surveyor, Mr. Dendy Watney, F.R.I.B.A., in 1908. It consists of a block of offices conveniently planned and grouped round a centre courtyard, on one side of which is a columned way affording access from Ironmonger-lane to the ambulatory, a pleasing feature which gives character to a reticent and practical piece of design in which the necessities of lighting and other amenities have been carefully borne in mind.

We have alluded to the connection between the Mercers' Company and trade, but a large part of the work which they have done in the past, and are doing on a greater scale now, is connected with charity and education, and it will be apposite here to refer to some of the great men who have been intimately connected with their history and whose testamentary bequests have been worthily administered by the Company.

The first of these names is Sir Richard Whittington, one of the greatest London merchants in the time of the Plantagenets and a prominent Mercer, who rebuilt the church of St. Michael Paternoster, contributed very largely to St. Bartholomew's Hospital, the Guildhall, and the Library of the Corporation of London, founded a college for priests, and established a chaplain to St. Paul's Cathedral. He also founded almshouses for thirteen men and endowed it, and the original ordinances of this are in the possession of the Mercers' Company. Freemen of the Company, but no liverymen, could be admitted to these almshouses, the Company being bound to maintain their own liverymen. The property of Sir Thomas Whittington was devised to the Company to maintain these institutions. The college was suppressed under the provisions of an Act for the abolition of chantries, etc., in 1548. The original almshouses, situated in the churchyard of St Michael, Paternoster-row, were destroyed in the Great Fire, were subsequently rebuilt, and when they became dilapidated were rebuilt on Highgate-hill, and entitled Whittington College. This is now managed under a scheme of the Charity Commissioners, which, after providing for the upkeep of the college, applies the residue to the payment of pensions and grants to indigent members of the Company and to the relief of the necessitous poor.

Mercers' School is one of the oldest schools in London, and is of Royal foundation. In 1447 a petition was presented to Henry VI. by the rectors of All Hallows the Great, St. Andrew, Holborn, St. Peter, Cornhill, and St. Mary Colechurch, praying that grammar schools might be erected in their parishes. John Neel, rector of St. Mary Colechurch, was also Master of the Hospital of St. Thomas, and the King willed "that it be doone as it is desired," and an Act of Parliament was passed, the School being erected in the parish of St. Mary Colechurch. On the dissolution of the hospital and its surrender to the Crown, the Company, on their purchase of the hospital, covenanted to find and keep a grammar school in perpetuity, and under this covenant Mercers' School was established and first opened in 1542. Thomas Rich, who had been educated there, subsequently left money to the Company to give University exhibitions to poor students educated in the school. On the widening of Old Jewry in 1787, the school was pulled down and the scholars removed to another house. The school was increased in 1879 to 125 boys, and in 1880 to 150 boys, and in 1890 the Company purchased Barnards Inn for purposes of erecting larger buildings, which were carried out from designs of Mr. Thomas Chatfeild Clark in 1893. The Company paid £70,000 for the site.

St. Paul's School was the outcome of a bequest by Dean Colet, who was born in 1466, and became, by the death of his father, possessed of a large fortune. He was admitted to the freedom of the Company in 1508, and two years later communicated to the Company his dispositions for the foundation of a school. During his travels he had perceived the importance of the revival of learning, and desired to equip the children of his country so that they might take their place by the side of learned men of other nations. The site of the School, probably inherited from his father, was on the eastern side of St. Paul's. Its management was left to the Court of Assistants of the Mercers' Company, and when Colet was asked the reason of his trust he replied that there was "no absolute certainty in human affairs," but that for his part he "found less corruption in such a body of citizens than in an or degree of mankind." A scheme was by the Endowed Schools Commission the better management of the School, i quence of which the Company purcha present site in West Kensington in 18 new buildings were erected at a cost of from designs by Alfred Waterhous school ranks third in point of date and a of all English public schools. In 1 governors purchased a site in Bro Hammersmith, and built a school, girls, from the designs of Mr. Gerald H

The Gresham family, who derive name from the village of Gresham in have been closely associated with the Company. Sir Richard Gresham was in 1533, 1539, and 1547, and Lord Mayo He desired to erect a "Burse" or Exc London on the model of that of Antw died without seeing the project carr He was instrumental in obtaining for the the grant of the church and hospita Thomas, and his son, Sir Thomas carried out the building of the Royal E and the foundation of Gresham Coll his death he gave one moiety of th Exchange and the shops thereof to the of London, and the other moiety to the Company and their successors, directi the City Corporation should pay £50 to four persons to read lectures on Ast Music, and Geometry, within the house called Gresham House in Bish street, and that the Mercers' Compan pay £50 to each of three persons to b by them to give lectures on Law, Ph Rhetoric in the same place, as well a sums to hospitals and in relief of the

Gresham College escaped the Fire. Royal Exchange was burnt and rebu enlarged scale by Jarman, the City S at a cost of £65,979 11s., the City Company paying in equal proportions

In 1768 an Act of Parliament wa by which Gresham College was veste Crown for purposes of erecting an Office, and an annuity of £500 was to the Corporation and the Mercers' The stipends of the lecturers were au and the lectures were delivered in ro the south entrance of the Exchan it was burnt for a second time in 1838 the Charity Commissioners reported on the Gresham Estate, they pointed the City and Company were losers by t of Sir Thomas Gresham to the e £201,318 expended by them. The rebuilding the Exchange for the sec amounted to £171,552 6s. 11d., which defrayed in equal parts. The Gresh mittee subsequently purchased a piec at the corner of Basinghall-street an the building known as Gresham Colle has been further enlarged by the pr a large hall with offices over, erected designs of Mr. Dendy Watney, the C surveyor, at a cost of £50,000.

The Mercers' Company took part ference in 1877 with representative Drapers' and Clothmakers' Compani provisional committee of representati Corporation and Guilds of London, w formed to consider the best manner funds could be applied towards the imp in technical knowledge of those engag manufactures of the country, and thi in the foundation of the City an Institute at South Kensington in 18 the Finsbury Technical College is als The City Corporation and the Livery had contributed £900,000 to the City a Institute up to the end of 1912; the co of the Mercers' Company was £80,0 amount.

THE BUILDING TRADE.

MASTER BUILDERS' SOCIATION OF NEW UTH WALES.

take the following from the annual :—

State of the Trade.

g the past twelve months there have o serious factors exerting a depressing e on the trade, viz., the war and a extending over a considerable area of e. Towards the end of the first quarter ear there was to some extent a revival, sequently a further depression set in tinued until the end of the year. The effect of these factors on the building as been to considerably delay projects constructional enterprises, though ely a very considerable amount of sidential work in the suburbs has been d with.

ar has also affected the building trade ier way. All imported materials, and hich, though manufactured locally, on imports for their raw material, nsiderably increased in cost (*a*) through ural tendency of the artisans and s to put a little more speed into their account of the fact that employment o secure; and (*b*) a tendency to cut n the part of many builders owing to ll amount of work coming out and nsequently increased competition. s which are entirely of local production rtunately not increased in price. It tful, therefore, whether the increase prices of imported materials really ny increase in the cost of the whole the building owner.

atistics kindly provided by the officers Water and Sewerage Board annually, the number of buildings completed the twelve months in Sydney and show a considerable falling off during od under review. The falling off in ber of buildings completed is greater ity than in the suburbs. In the city re was in 1915 a decrease of 37·3 per against 1914; in the suburbs the amounted to 28·36 per cent. for the riod.

State of the Labour Market.

gh certain trades have been kept y on work in connection with the war, trades there has been a considerable in the numbers employed. Owing to number of men having enlisted for rvice, there has not been the distress re would have been if the falling off ade had been due to any other cause.

Conditions of Contract.

ost important work that the Association e, possibly, in the last twenty years n completed within the past twelve The revising of the Conditions of which has occupied the attention nstitute of Architects and this Asso- r some four or five years, was finally to a close during the past year, and Conditions of Contract and Agreement ne into operation on November 1, 1915, the seal of the Institute and this on. The two documents are printed so that one cannot be used without r, and the control of the selling of uments is in the hands of the Institute ects. Members are reminded of the of insisting on these Conditions of and Agreement Forms in every con- y undertake (with the exception of he Government or municipal councils), unless the specification states that ditions will be used, every member ndorse his tender "subject to the s of contract adopted by the Institute ects and the Master Builders' Asso- New South Wales."

Day Labour and State Socialism.

The Government still continues its policy of extending State employment and State ownership into fresh fields of industrial enterprise. Figures are not available for all the State industrial undertakings, but of those known three show profits on paper and four admit losses. The State enterprises showing profits are:—The South Coast Metal Quarries, profits for the year, £6,322 9s. 5d.; accumulated profits of previous years, £9,914 3s. 8d.; total, £16,236 13s. 1d. In this case the Minister promised at the outset to reduce the price of blue metal about 50 per cent., but no reduction was made then, nor has there been any reduction since. The State Motor Garage shows a profit of £154 13s. 2d. The State Brickworks at Homebush show an accumulated profit of £9,387 19s. 5d., after charging considerably more for its products than they promised when the scheme was first called into being, and after allowing little or nothing for the cost of railway, electric light, and so on. Depreciation is another item that has evidently been made to accommodate itself to the desire of showing a profit.

The State enterprises showing losses are:—The State Brickworks at Botany, which shows a deficiency of £8,696 19s. 4d. The State Limeworks at Botany and Taree show a deficiency of £7,822 11s. 10d. The Rozelle Joinery Works show an accumulated loss of £20,473 8s. 5d., but it is only fair to state that these losses include the loss by fire of £14,917 5s. 7d., so that the loss on trading is shown as £5,556 2s. 10d. The State Timber Yards and Workshops at Uhr's Point have been the cause of the biggest loss to the Government of any of the State undertakings of which figures have been supplied. The net loss for the year ending June 30, 1915, is set down as £25,145 14s. 2d., to which must be added the loss brought forward from the previous accounts of £5,343 11s. 8d. The loss on this undertaking to the end of the last financial year is therefore £30,489 5s. 10d. The above figures have been taken from the Auditor-General's Report.

Industrial Arbitration.

At the outset of the war the State Arbitration Court gave a decision which for the time being closed the activities of the Wages Boards; this was received with strong dissent by the union officials, with the result that early in 1915 the President of the Court delivered another pronouncement modifying the previous one, to the extent that the Boards might continue their work but should only take into consideration the effects of the war not only on the industry itself, but on the community in general. Consequently the Wages Boards have continued their operations since that time, and the Court has also been exceptionally busy in hearing appeals and reconstituting Wages Boards which had expired by effluxion of time.

The compulsory arbitration law was brought into existence for the purpose of forcing employers and employees to settle their differences by other means than strikes and lock-outs, and for the purpose of ensuring employees against sweating, but strikes have been more numerous since the introduction of the law than they were previously. Employers have been fined for breaches of the various awards; employees have been prosecuted for striking, but the penalties have not been enforced. Under such circumstances what can be expected but a disregard for the law, whenever it suits them, by those who find that it is not enforced when they break it?

Technical College.

The new system of technical education, introduced in 1913, appears to be working smoothly and is showing signs of being a considerable improvement on the old methods of teaching. Representatives of employers' and employees' associations are on the Advisory Committees, acting as examiners, giving advice to the Public Service Board in the appointment of teachers, and in many ways assisting the Department to make the system a success. Members of this Association have been doing their part during the past twelve months, and the Association has also continued the system of presenting prizes to successful building trade students.

PUBLIC WORKS, ETC.

Australia.

The Commercial Intelligence Branch of the Board of Trade is in receipt of a copy of the estimates of expenditure of the Government of Western Australia from the General Loan Fund for the year ending June 30, 1916, providing for a total expenditure of £2,103,881, the chief items being as follows:—

Railways and Tramways (£685,975), including additions and improvements to railways opened, £120,000; railway construction, rolling stock, etc., £266,975; electric tramways at Perth, £88,000; electric power station at East Perth, £182,000.

Harbours and rivers (£157,883), including harbour improvements at Albany, Bunbury, Fremantle, etc., £140,100; jetty works, £17,000.

Water supply and sewerage (£337,120), comprising water supply for towns generally and goldfields, sewerage works at Perth and Fremantle.

Agriculture (£540,074), including abattoirs, cold stores, canning works, etc., £121,000; industries, etc., £199,524.

Roads, bridges, etc. (£59,000), including new roads and bridges, £10,000; public buildings, £30,000.

In connection with the above, it may be noted that an Act of the Western Australia Legislature, assented to on December 7, authorises the raising of a sum of £1,245,000 by loan, for the construction of certain public works and for other purposes. A schedule to the Act allots, *inter alia*, £495,000 for expenditure on railways and tramways, £107,000 on harbours and rivers, £130,000 on water supply and sewerage, and £102,000 on the development of agriculture.

EDUCATION AND PRODUCTIVITY.

In the course of an address on "The Industrial Outlook and its Relation to the Gas Industry," delivered on March 29 at the eleventh annual meeting of the Society of British Gas Industries, Mr. Horace Moore Thornton, J.P., Chairman of the Council, said: "Our future depends in no small degree on our educational policy. Enthusiasm is impossible without knowledge; and lack of enthusiasm has been responsible for many of the shortcomings of British workers. Slackness, narrow-mindedness, inability to realise great issues, and lack of perception are largely due to the fact that opportunity has not been provided to secure the knowledge that will enable the true proportions of a man's position as a unit in the nation's industry to be realised. Haphazard methods, providing but a smattering of theory, the endeavour to inculcate knowledge in evening classes only when the youth is exhausted by a day's work, must give place to properly systematised education, with opportunities for training during the daytime. It is of great importance that we should encourage and support our universities and technical schools to enable them to provide for the industries of this country a large number of well-trained scientific men. We are glad that as a Society we assisted in founding the Livesey chair at the Leeds University, and that we have been able to provide annual prizes for successful candidates in the Gas Engineering and Gas Supply examinations of the City and Guilds of London Institute. I am sure as our funds permit we can find no better and more profitable form of investment than in educational encouragement."

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—At a recent meeting of the Streets and Roads Committee of the T.C. tenders for a railing in Spa-street were submitted, and that of Messrs. A. & G. Main, Glasgow, was accepted. A plan of a building in Murray-terrace was approved of.

Aylesbury.—The U.D.C. has passed plans of a building for petroleum storage off Park-street, for the Bowring Petroleum Company, Ltd.

Barnes.—The D.C. has approved the following plans:—Garage, 37, Coval-road, Messrs. Cox & Taylor; additions finings house, Mortlake Brewery, Messrs. Watney, Combe, Reid, & Co.; amended plan of house, Richmond Park-road, Mr. W. A. Lane; and additions to malt elevators, Mortlake Brewery, Messrs. Watney, Combe, Reid, & Co.

Bedford.—The T.C. has approved plans of motor garage, for Mr. F. W. Smart, Shaftesbury-avenue, and house, Mr. R. Jeakins, Cutcliffe-grove.

Belfast.—The Works Committee of the Belfast Harbour Board has approved a plan of a building which Messrs. Workman, Clark, & Co., Ltd., propose to erect on the ground recently let to them at the Clarendon Graving Dock.

Bletchley.—The U.D.C. has passed plans for a new workshop for Messrs. Cook & Son, and plans for houses in Aylesbury-street, for Messrs. Howard Bros.

Braintree.—Mr. A. J. Wicks, Braintree, has applied to the R.D.C. for water to be laid on to the Courtauld Estate, Bocking, where he proposes to build four houses. Sixteen plots on this estate are about to be built upon. It has been decided to lay the main and to construct a hydrant on it.

Broadstairs.—Broadstairs and St. Peter's Council has approved plans of additions to Bruce Lodge, Kingsgate, for Sir W. Capel Slaughter, and alterations to the Wrotham Arms, Broadstairs, for Messrs. Rigden & Co.

Coventry.—The R.D.C. has approved plans for a new messroom at the Humber Works and for extensions of offices and drainage, for the Albion Drop Forgings Company, Ltd.

Darton.—The Council has passed plans for eight houses in Kexbro'-lane, Darton, for the Darton Main Colliery.

Dover.—The R.D.C. has approved plans for the rebuilding of Mr. Hodgson's premises at Temple Ewell, which were destroyed by fire recently. The plans were submitted by Messrs. Worsfold & Hayward.

Durham.—Plans passed by the R.D.C.:—New-street, belonging to Messrs. Walter Scott, Ltd., at Quarrington Hill; and addition to dwelling-house, for Major J. Willan, at Shincliffe.

Edinburgh.—The T.C. has adopted the recommendations of the Electric Lighting Committee for an additional expenditure of £11,000 at M'Donald-road Station. The Council has agreed to the acceptance of estimates for the building and steel work of the new generating station at Portobello amounting to £30,570. Plans have been submitted to Edinburgh Dean of Guild Court for an extension to the sphagnum moss factory at Messrs. Redpath, Brown, & Co.'s works, Easter-road.

Farnborough.—The U.D.C. has passed plans for a new cinema theatre which it is proposed to erect in the Farnborough-road, for Mr. A. Chaplin.

Foleshill.—The British Structural Syndicate (Birmingham) proposes to erect some hundreds of bungalows on an estate at Foleshill.

Hendon.—The following plans have been approved by the D.C.:—Motor garage, High-wood-hill, Mr. A. E. Colebrook; house, Brent-mead-place, Mr. Martin Harvey; additions to 50, The Ridgeway, Golder's Green, Mr. J. Finch; motor garage, 16, The Riding, Mr. A. J. Edmonson; workshop, Golder's Green, the Vulcan Car Agency; detached house, Sunnydale-gardens, Mill-hill, Mr. Golby; motor house, 1, Goodwyn-avenue, Mill-hill, Mr. E. T. Clarkson; five houses, St. George's-road, Mr. J. D. Rawlins; storehouse, Colindale Wine Stores, Colindale-avenue, Mr. H. Wiltshire; twelve houses, Princes Park-avenue, Mr. E. H. Waterman; enlargement of workshops, Finchley-lane (Globe Radio Apparatus Works), Mr. H. R. Rivers Moore; messrooms, London Aerodrome, the Grahame-White Aviation Company; caretaker's rooms, London Aerodrome, the Grahame-White Aviation Company; two houses, Golder's Green-road, Mr. E. Wright; eighty houses, Sinclair-grove, Haymills, Ltd. Messrs. E. Bevir & Son transmitted engrossment of agreement varying the terms of agreement for the purchase of land for a hospital site. A resolution was passed that the agreement be signed, and that a cheque be drawn in payment of the amount of the Council's share in respect of loss of rents in accordance with the terms of the agreement of May 31, 1915.

Lanarkshire.—An application by the Middle and Lower Ward Committees of the Lanark C.C. and the Corporation of Rutherglen for the purpose of securing power to prepare town-planning schemes in Cambuslang, Burnside, and a part of the parish of Carmunnock, and in an area already lying in the burgh of Rutherglen, was the subject of an inquiry by the L.G.B. for Scotland at Glasgow recently.

Linthwaite.—A plan of a warehouse at Manchester-road, for Messrs. Geo. Cock, Ltd., has been approved by the U.D.C.

Oldbury and Langley.—A scheme has been formulated by Messrs. Accles & Pollock, Ltd., for the development upon garden city lines of the Basons-lane and Vicarage Farms Estate. Sanction has been secured to the immediate erection of sixty-four houses upon a section of the land, and plans of workmen's cottages, as prepared by the Bournville officials, have now been definitely approved.

Ossett.—Plans passed by the T.C.:—Dwelling-house in Runtlings-lane, for Mr. C. Hinchliffe; structure to carry a water tank at Manor Mill, for Messrs. Tennant & Rodley; rebuilding of carbonising shed in Dale-street, for Messrs. Langley Bros.

Scotland.—Lord Provost Dunlop is about to inaugurate a fund for the establishment in the West of Scotland of a hospital for limbless sailors and soldiers.

Southend.—The following plans have been approved by the T.C.:—Bungalow, Scarborough-drive, Mr. E. L. Walmsley; two houses, North View-drive, Mr. T. Sloman; addition to bungalow, Marguerite-drive, Mr. S. C. Arnold; conversion of shop into house, Park-street, Mr. F. P. Guiver; conversion of house into shop, 399, London-road, Mr. F. G. Bethley; motor house, "Hillcrest," Cliffsea-grove, Mr. G. Rogers; scullery, "Heston," Cliffsea-grove, Mr. F. Watmough; bathroom, "Sandown House," Branksome-road, Mr. H. T. Cook; bungalow, Lime-avenue, Leigh, Mr. S. C. Arnold; bungalow, Cliffsea-grove, Mr. C. H. Bentley; motor garage and alterations, 33 and 35, High-street, and 3, Clarence-street, Mr. R. Arnold. The Borough Surveyor has laid before the T.C. reports as to the inquiries made by him affecting the various estates included within the area of the North-Western Town-Planning Scheme, and also upon the question of preparing a town-planning scheme in respect of the remaining undeveloped portions of the borough.

Staines.—A plan for a house in Dawley-road, Harlington, deposited by Messrs. F. & H. Wakeman, has been approved by the R.D.C.

Stalybridge.—The Highways Committee has passed plans for a transformer house proposed to be erected by Goodbrand & Co., Ltd., Britannia Foundry, Clarence-street.

Westcliff-on-Sea.—Town-planning schemes have been prepared for the various outlying parts of the town which have not yet been developed.

Yarmouth.—Plans approved by the T.C.:—House, Station-road, Southtown-road, for Mr. H. R. Middleton; motor shed, Belvidere-road, for Mr. Docwra; oil tank and shed, G.E.R. Goods Yard, Vauxhall Station, for the "Shell" Marketing Company, cottage and shed, Bure Bank, Runham, for the British Gaslight Company; alterations to fishing premises, Nelson-road Central, for Messrs. Mitchell & Sons.

NEW GOVERNMENT CONTRACTS.

War Office.

Cable and Wire, Electric.—S. S. Abelson & Co., 28, Clerkenwell-road, E.C.; British Insulated and Helsby Cables, Ltd., Helsby, near Warrington; Connolly Bros., Ltd., Blackley, Manchester; W. T. Henley's Telegraph Works Company, Ltd., North Woolwich, E.; Hooper's Telegraph and India Rubber Works, Ltd., 31, Lombard-street, E.C.; India Rubber, Gutta Percha and Telegraph Works Company, Ltd., Silvertown, E.; Johnson & Phillips, Ltd., Charlton, S.E.; St. Helen's Cable and Rubber Company, Ltd., Bank Quay, Warrington; Siemens Bros. & Co., Ltd., Woolwich, S.E.

Cranes.—Butters Bros. & Co., Ltd., Glasgow; Grafton & Co., Vulcan Works, Bedford; Ransomes & Rapier, Ltd., Ipswich; J. H. Wilson & Co., Ltd., Dock-road, Birkenhead.

Engines, Oil.—Petters, Ltd., Victoria-street, Bristol.

Granite Setts.—J. Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W.

Plant, Acetylene, Welding, etc.—Imperial Light, Ltd., New-road, Battersea, S.W.

Sheets, Corrugated, Iron and Steel.—J. Summers & Sons, Ltd., Hawarden Bridge Works, Shotton, Chester.

Steel, Constructional.—Earl of Dudley's Round Oak Works, Ltd., Brierley Hill; Frodingham Iron and Steel Company, Ltd., Scunthorpe.

Tanks.—T. Fildes, Thornton-street, Collyhurst, Manchester.

Tools (Term Contract).—Peacock Bros., 318, Sheffield-road, Tinsley, Sheffield.

GENERAL BUILDING NE

NEW POST OFFICE, BUCKIE.

Buckie's new Post Office, which is sit the south side of East Church-street, wa for business a few days ago. On ente front door one approaches a roomy offi floor outside the counter is laid with til behind the counter the floor is of woode The postmaster's room is situated al centre of the building. At the rear is ing office, which is the largest room building. Adjoining the sorting offi store-room. Near by are the retirin for male clerks and postmen. The Po is heated throughout with hot water ra At the rear of the building is a courty several outhouses. Messrs. Sutherland & Aberdeen, were the architects, and the con were:—Masons—Messrs. Alex. Milne Buckie; slaters and plumbers, Messrs J. & Son; joiners, Messrs. Geddes & Portessie; painters and glaziers, Me Kintrae & Son, Elgin; plasterers, Rodger & Baxter, Aberdeen.

TRADE NEWS.

Boyle's latest patent "air-pump" ve have been applied to the Council Resolven, Neath, Glam.

We have been informed that some pits situated at Aberdeen have bee watertight with Pudloed cement concr

The Langley Silk Mills, Macclesfi being supplied with Shorland's patent roof ventilators by Messrs. E. H. & Brother, Ltd., of Failsworth, Manch

Messrs. Alfred Goslett & Co., Ltd., a a dividend of 8 per cent. on Ordin Participating Preference Shares, £l reserve and £3,810 forward, subject to and excess profit taxes.

Owing to the growth of his business asked to state that Mr. Ernest Ingra advertising agent, has now remove Stanton-road to more convenient of 2, The Broadway, Wimbledon, S.W.

WAGES IN THE BUILD TRADE.

Derby.—At the recent annual of the National Board of Conciliation Building Trades an appeal was hea the carpenters and joiners of this distri application was for an advance in but at the outset a question arose a validity of the notice. The local rules that notice for an alteration must within the first week in November. operatives had handed in early in O request for an advance in wages and a tion of the rule as to overtime, couple request for a relaxation of the rule as t The employers had refused the re and called attention to the fact that as to notice had not been complied wi operatives contended, however, th request was in effect a notice as well as for relaxation of the rule as to notice, fact that it was given prior to the first November did not render it invalid. discussion ensued, and eventually the motion was agreed to and became the of the Board:—"That, though this of opinion that notice ought to have be in the first week in November, it recc the Derby builders to grant an advan per hour on May 1 to the carpent joiners, and that all other matters drawn."

Exeter.—An appeal from the ca and joiners of this district for an ad wages of ½d. per hour was heard at th meeting of the National Board of Co for the Building Trades, held in Lo March 13. For the operatives Messrs. Langmead, and Jefferies in their stated the demand was based upon the cost of living. The existing rate was hour, and the last increase, ½d. in 1914 first in seventeen years. For the e Mr. Westcott appeared, supported by

that there was little work going on
save in one or two cases, where war
progress; competition was very keen
ounding lower-paid districts; the
were sympathetic, but wanted the
to wait until the war is over. After
the evidence the Board decided :—
wages of Exeter carpenters and
increased from 8d. to 8½d. per hour
xt pay day."

.—At the recent annual meeting
tional Board of Conciliation for the
Trades an appeal was considered
rpenters and joiners and bricklayers
for an interpretation of the overtime
ned in the working-rule agreements
tween these unions and the London
ilders' Association when applied
tion of ante-time (viz., time worked
arting time in the morning). Mr.
or the appellants, traced the history
tion, which he contended showed that
for many years had been to pay
ne at double rate, but that latterly
n had arisen that the rule did not
double time should be paid for ante-
nly time and a quarter. Mr. Adams
he contention. Mr. Renshaw replied
spondents, citing precedents which
ed supported the contention of the
that the overtime rule did not mean
worked prior to starting time next
s to be paid for at double time rate,
and a quarter, and said rules with
rs and machinists actually so pro-
er considering the evidence, the
led :—" That this Board is of opinion
rules agreed upon between the
and joiners, the operative bricklayers,
M.B.A. imply that ante-time should
as double time." In the case of a
peal by the operative bricklayers
rpretation of how far, if at all, the
working-rule agreement bearing on
ent of disputes became inoperative
ence of both parties having joined
l Conciliation Scheme, wherein the
of the operatives was that the
by became inoperative, and the
of the employers was that it did not,
of the Board was that the rule in
mains in force, and that all differ-
ondon must follow the course of
aid down in the National Conciliation

er.—An appeal by the operative
and joiners, bricklayers, and
this district was heard at the recent
eting of the National Board of
for the Building Trades. The
was for an advance of wages of 1d.
the existing rates of 9d. per hour
ters and joiners and bricklayers,
er hour for labourers. For the
Messrs. Blount, Manning, Collyer,
said that the demand was based
ncreased cost of living. Trade was
o munition work was going on. In
rs they had only had two advances
hour; the last was two years ago.
spondents Mr. J. Stokes said the
vere sympathetic to the demand, but
g trade was a dwindling one in
The alleged scarcity of labour was
ration to munition areas. Messrs.
Spicer supported, and drew atten-
low rates prevailing in neighbouring
The Board, having considered the
ne following motion was agreed to
the decision of the Board :—" That
of ½d. per hour be granted to the
peratives as from April 1."

MASTER BUILDERS' ASSOCIATION.

al meeting of the Ipswich Master
ssociation was held recently. Mr.
een, President, was in the chair,
y the master builders of the town.
Green was re-elected President for
year, Mr. Robert Catchpole Vice-
and Mr. Charles Borrett Treasurer
ry. The Executive Committee was
ith the addition of Mr. Buckingham
as decided not to hold the annual
year on account of the unsettled
onal affairs.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

——	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Masons' La-bourers.	Brick-layers' La-bourers.	Plas-terers' La-bourers.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk** *) a
advertised in this number: Competitions, —; Contracts, iv.; Public Appointments, —; Auction Sales, xviii. Cert
conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not b
themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be m
for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those will
to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while ev
endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

CX.—No. 3818.

APRIL 7, 1916.

THE ARCHITECT IN LITERATURE.

THE word "architect" does not occur in English until 1563, in which year John Shute, the dates of whose birth and death are alike unknown, published his "First and Chief Groundes of Architecture, used in all the Auncient and Famous ments," in the introduction to which he describes himself inter and architect, and mentions his studies under the rchitects in Italy, whither he was sent by the Duke of umberland in 1550. The next reference to the word, ling to the Oxford Dictionary, occurs in "Paradise Lost," century later, for the architect had not come to his own ently to be realised as a person in any of those books racters, such as Earle's and Overbury's, which were the t of the educated in the reigns of the first Stuarts; the Architect therefore does not balance the Bad in literature, ever he may have done in life. Inigo Jones, satirised e stage as Vitruvius Hoop, is described as "eminent in tecture," and this is in itself proof that the word "architect" s no recognised part of the vocabulary of the day. In n even the word is probably one of his own learned ngs; it had taken no hold when introduced by Shute, and not reappear after "Paradise Lost" until well on in the eenth century. Satan, in fact, is not only the earliest ple of the word in literature, but of the profession. The archangel, once "known In Heaven by many a towered ture high," recalls his powers in hell, and the growth of ew capital is described with a fierce power and bitter ration singularly striking in the case of a blind poet. It if the memories of Milton's early travels—of castles set on y Italian hills, of the overwhelming mass of St. Peter's— blended into one great and gorgeous vision. Nor would surprising, in the case of so stern an opponent of Rome, ilton had in his mind's eye the actual image of the vast edral when he wrote :—

> A fabric huge . . .
> Built like a temple, where pilasters round
> Were set, and Doric pillars overlaid
> With golden architrave; nor did there want
> Cornice or frieze, with bossy sculptures graven.

very doors "opening their brazen folds" suggest their han counterpart. Fancy might even take the lines further s symbolical of the Christian Gothic theory as against the ns borrowed from the Pagan temple, and contrast the wered structures high" which Satan had raised in Heaven the columns and architraves of Pandemonium, which could but be in a style the reverse of that celestial architecture :—

> Nor aught availed him now
> To have built in Heaven high towers; nor did he scape
> By all his engines, but was headlong sent
> With his industrious crew to build in Hell.

It is as if Milton's early love of cloisters pale and high owed roofs were taking its revenge on the unwilling recognion of the splendours of that great cathedral which to him the embodiment of Satan's kingdom upon earth, and on stately Neo-Classicism of a dynasty which he abhorred, Banqueting House of Whitehall, that fragment of a mighty n, and the Corinthian portico added to St. Paul's by the g, whose death-warrant Milton signed, in 1633.

Fantastic, then, as it may seem, we may regard Pandemonium the first capital, Satan as the first architect, of modern fiction, he has to wait long for a successor. The earliest novelists re interested in men and not their houses; one cannot agine Tom Jones as interested in architectural improvements, one of Smollett's heroes calling in professional advice, and n the first efforts of the romantic revival deal in buildings as they were, not as they were to be made. The Castle of Otranto is already built; so is that castellated erection in which much of the action of its little-known predecessor "Longsword Earl of Salisbury" takes place, while Mrs. Radcliffe's castles, including that which is chiefly known to modern readers by Miss Austen's allusions to Laurentina's skeleton, date back to a hoary antiquity. But the leaven was working; it is only a step from Gray's admiration of the ivy-mantled tower to his friend Mason's love of ruins for their own sake, and with Mason we at last come to another architect in literature. Mason's "English Garden" is not a work familiar in our mouths, but the activities of its hero Alcander, "an English country gentleman, as his name implies,"* are really noteworthy. On his "site" that worthy "first his taste employ'd," the "blank horizon" of the "sacred" site in question being only broken by a thin line of beech, whose "tameness" was thus done away with :—

> "Draw we round yon knowl,"
> Alcander cries, "in stately Norman mode,
> A wall embattled; and within its guard
> Let every structure needful for a farm
> Arise in castle-semblance; the huge barn
> Shall with a mock portcullis arm the gate,
> Where Ceres entering, o'er the flail-proof floor,
> In golden triumph rides; some tower rotund
> Shall to the pigeons and their callow young
> Safe roost afford; and every buttress broad,
> Whose proud projection seems a mass of stone,
> Gives space to stall the heifer and the steed.
> *So shall each part, though turn'd to rural use,*
> *Deceive the eye with those bold feudal forms*
> *That fancy loves to gaze on.*"

Filled with the idea of carrying out the beautiful scheme in the lines here italicised, Alcander proceeds to "build of old, disjointed moss-grown stone A time-struck abbey," whose prosaic purpose is to conceal the whereabouts of the dairy and the icehouse. The "fane conventual" accordingly arises, and Alcander proceeds to "lead his pensive maid" around its glories, and to propose the erection of a "proud rotunda" built of "forms pellucid," on "Ionic shafts"—*anglice*, a conservatory—which the maid, Alcander's "living goddess," viewed reluctantly after all, not, we regret to read, because of Alcander's bad taste, but because :—

> "My wish, thou know'st, was humble as my state,
> I only begg'd a little woodbine bower,
> Where I might sit and weep."

But we must leave these pseudo-pastoral love scenes for the creations of the Tilney family at Northanger Abbey, those admirable kitchen quarters, built by the general's father, which called forth Catherine's reluctant admiration, and that "tolerably large eating-room" which we are sure must have been a creation of General Tilney's own, with such modest pride does he admit it to be one of the necessaries of life.

"Northanger Abbey" was got ready for the press in 1803, though not published till 1817; thus it actually, though not apparently, preceded "Waverley," with its romantic joy in the picturesque domain of the Baron of Bradwardine, which would not, however, have called for mention here had not Waverley, who probably fulfilled Flora's prediction that he would "refit the library of Waverley Honour in the most exquisite Gothic taste, draw plans and landscapes, and write verses, and rear temples, and dig grottoes," rebuilt the whole after its destruction in 1745, as a surprise for his father-in-law the Baron, who promptly entails it on his second grandson, the first, who is to have Waverley Honour, being not yet even in sight.

---

* Leslie Stephen.

Scott, however, greatest of antiquaries and most loving of archæologists, hardly comes into our purview, since his characters live in or near ancestral homes and are not themselves, like their creator, the architects of their own dwellings. Perhaps the earliest professional architect in literature—for the elegant Alcander was only an amateur—was Mr. Pecksniff, who held that proud position, not by virtue of qualifications or of practice, for he "had never designed or built anything," but by virtue of his brazen (Dickensian prose for brass) plate and his reception of the pupils who spent from three to five years "in making elevations of Salisbury Cathedral from every possible point of sight (*sic*); and in constructing in the air a vast quantity of castles, Houses of Parliament, and other public buildings." In so far as beginning his adult life as a pupil of Pecksniff's constituted an architect, Martin Chuzzlewit was one, but we are not told that the varied fortunes of that young man included any efforts at putting his profession into practice. If Pecksniffs were common at the beginning of the nineteenth century, we feel that Adam Bede, that admirable master-builder, was justified in his contempt: "As for th' architects, they set up to be fine fellows, but the most of 'em don't know where to set a chimney so that it shan't be quarrelling with a door. My notion is, a practical builder, that's got a bit o' taste, makes the best architect for common things; and I've ten times the pleasure i' seeing after the work when I've made the plan myself."

The function of the practical architect on which Adam Bede insists is explained and broadened by two novelists of our generation, Mr. Howell's architect in "The Rise of Silas Lapham," who knows what a woman wants in a scullery than she does herself, and Mr. Arnold Bennett's Card, wh course of his meteoric career creates a fitting house for h old mother, having previously bought up through a the lease of her hovel and turned her out in the *rôle* rapacious landlord in order to ensure her living in befitting her position as his parent; and so admirable new house prove that its unwilling tenant was constra admit that, servantless as she insisted on remaining, sh clean everything up and be ready for callers by ten We feel that there is a distinct opening for the modern life.

But we must retrace our steps and leave the light of Howells and Bennett for the more serious paths of in which the architect as a character is curiously infr It was reserved for Mr. Hardy, wise by his own experie treat the architect as hero. No one can help liking S Smith in "A Pair of Blue Eyes" any more than fated Elfrida who lacked the courage to be true to the excellent George Somerset of the "Laodicean, "sketched or measured many old country churches now down or altered." If more of our architects had th passion of Mr. Hardy and his heroes for the legacy of t the architect in fact might play a larger part than he fiction, and the restoration age of the Victorian era have been less unhappy than it was in the eyes of a gen that has grown as much beyond the ideals of a Scot Butterfield as it has beyond those of the forgotten Gothi of Alcander.

◆

NOTES.

The Atelier and the A.A. An exhibition of unusual interest was held at the First Atelier of Architecture on the last Wednesday in March. The occasion was the second joint exhibition and criticism arranged between the Atelier and the Architectural Association, the first having been held at the Association. The subject of the competitions was a National Library, and some extremely interesting and promising work was submitted. A "Mention" was awarded to Mr. Tomlins, of the Atelier, for a well-laid-out and characteristic design. This being the first visit of the Architectural Association, the visitors were briefly welcomed by Mr. A. R. Jemmett on behalf of the Atelier, and after the Patron, Mr. A. J. Davis, had given his criticism Mr. Stanley Hamp expressed the sympathetic attitude of the Council of the Architectural Association and their belief in the value of such joint competitions. The special interest of the evening was further enhanced by the fact that it was the last appearance of the Patron before leaving for active service in France. In making the announcement Mr. Davis expressed his very strong wish and hope that the Atelier would be carried on as usual in his absence. On behalf of the Beaux-Arts Committee Mr. Percy B. Tubbs expressed appreciation of Mr. Davis's services, and, in referring to the intention of the Committee to keep the Atelier running, pointed out the financial difficulty caused by the fact that all the eligible working members were absent at the war. Mr. Bucknell, representing the working members, voiced their thanks to Mr. Davis and their good wishes for his welfare while on active service. A memorable evening in the history of the Atelier was brought to a close with an enthusiastic send-off to the Patron, who was leaving for France next morning. We think that everyone who realises the necessity of progress in our methods of architectural education would be sorry if the Atelier was obliged to close for the remainder of the war. The reasons for making a special effort to keep the Architectural Association schools open apply with equal force to the Atelier, and we hope it will eventually receive assistance in like manner and from the same quarter.

A Change of *Rôles*. We hail with delight the excellent series of short architectural essays which the *Times* is giving its readers under the heading of "History at Close Quarters." The last of these is a very readable article on the "Opening of the White Tower." These incursions into the field of architecture are, we hope, an indication of the growing interest taken in buildings—an interest which is very marked in the *Manchester Guardian*, where from time to time good architectural criticism is to be found. At present these journals usually lack illustration, but that is a want which may be made good later on. But there may be room for a *quid pro quo*, and possibly architectural publications may in the future give leaders dealing with the political situation. The reconstruction of our Party system after the war would ~~be a~~ good subject for such a leader, and there would be a suggestion of fitness in advice on State reconstruction being found in an architectural work. Why, after all, should we not shake Cabinets and support political parties? Possibly if we did might see the last of that Old Man of the Seas, Mr. Lloyd contribution to our Land Acts! How a Government can take to itself for shutting up museums and picture-galleries on th of economy and persist in the administration of an Act which an annual loss and also chokes and stultifies legitimate tra speculation is more than we can imagine.

Traffic. Dr. Waldo, H.M. Coroner for the City and wark, calls attention in his annual for 1915 to the fact that a large number of from fires occurred during the year. He held inque sixty-three deaths from traffic fatalities, the highest num record since the introduction of motors, and adds that th cause of the increase is the absence of street lighting, owing conditions brought about by the war. The suggested remed (1) more street refuges, especially along wide streets where tra run; (2) more police, especially at traffic-crossing points; more lifeguards or fenders in the shape of side-guards for hind in the case of heavy motors. The first of these remedies i the expenditure of money by local authorities which, desirable, is probably not feasible at present; the secon represents additional expense; the third could be cover additional regulation; but all the recommendations should be into effect when normal times return. Mr. Waldo also calls att to the fact that a large hoard of Tudor ornaments and jewelle unearthed in the City and has been secured by the Treasury u secret arrangement with a person or persons. Fifty-two of ornaments are now at the London Museum, while others ha seen on view at the British Museum. Dr. Waldo says he is u nately not able to hold an inquest on these treasures, since the been removed out of his jurisdiction, but advises the Corporat bring a civil action for their recovery in order that they m deposited in the City of London Museum. According to the C the ornaments, under a Royal Charter (June 24, 15 Charles II. belong to the Lord Mayor, Commonalty, and Citizens of L and could be recovered by legal action.

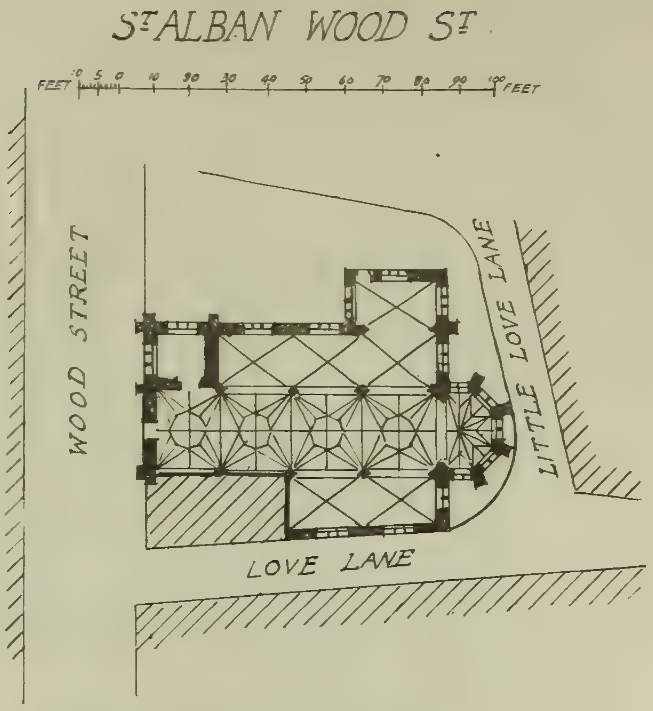
Fires. We are glad to see that Dr. Waldo says th of 169 City fires which occurred in the year the is unknown in respect of seventeen only. One of the total can be traced to a light having been thrown dow twenty-six to defective electrical arrangements. The Coroner su the extension of the system of the Special City Fire Inquests as was recommended by the Departmental Committee in 1909, there is special need of full and careful investigation into the ca fires at the present time. He points out that the fact that inquests are held has a deterrent effect on incendiarism, as an i provides additional machinery for detecting and punishing the Considering the proportion which fires caused by the careless thr down of lights bears to the total, it seems time that such pra were penalised, since they are quite as detrimental to the interests as the practice of spitting, which is now punisha exercised in public places.

LONDON CHURCHES WREN AND LATER CHITECTS OF THE NAISSANCE.

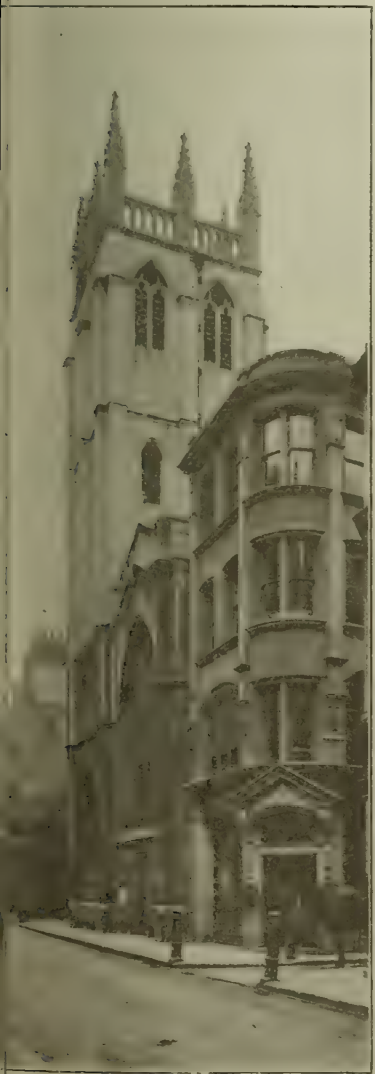
. XXIV.—St. Alban, Wood-Street.

t. Alban, Wood-street, is often included lists of Wren's churches, it has a place series; but an examination will show hile it is one of the churches which ebuilt under Wren's direction, it is evident that either much of the older re remained and gave its character to church or it must have been the work aster mason unusually conversant with ails of the former structure. It cannot, . Michael, Cornhill, or St. Mary Alder- be described as being pseudo-Gothic, in plan and design an example of very rpendicular, of which the weakness and f vigour paved a way for the coming of type. It had been rebuilt under ection of Inigo Jones only thirty years s to the Fire, and the church we see is undoubtedly the restored copy of what obably one of the last works of the period.

s unfortunately been much modernised erefore rendered less interesting to the of style, a polygonal chancel termina- modern date replacing a former square with a large window; the walls have ripped of their panelling, and the pulpit ly a few monuments mark the date of ilding. The tower and west window are the most pleasing features of the church, which should be compared rather with St. Helen, Bishopsgate, and St. Katherine Cree than with Wren's work.



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)



[Photo.: Geo. Trotman.

n's Churches: St. Alban, Wood-Street.

The original church was a very ancient one, tradition relating that King Offa had a palace in Wood-street of which the church was the chapel, and that he granted the parish to the Abbot of St. Albans. At a later date the advowson passed into the hands of the Provost and Fellows of Eton College, who have since continued its patrons. With the church is united the parish of St Olave, Silver-street, which was not rebuilt after the Fire.

No. XXV.—St. Andrew, Holborn.

The appearance of St. Andrew, Holborn, has been partially spoilt by the raising of the roadway when Holborn Viaduct was constructed. The first church on the site was in existence in the year 971, as it is mentioned in a charter of King Edgar defining the boundaries of the parish of Westminster. It was rebuilt in the fifteenth century, repaired in the reign of Charles I., and was finally rebuilt by Wren in 1686. The original tower was left, but was subsequently recased with Portland stone in 1704. Some of the original Gothic arches still remain. The church is one of the largest of the galleried churches designed by Wren, and one of the most commonplace and uninteresting. It has been extensively restored and modernised, and the original organ has been replaced. The tower is simple and pleasing in design, and in its form suggests a very usual Gothic type.

There are many interesting associations connected with the church, which is said to be the burial-place of John Webster, the dramatist. Sir Edward Coke, the famous lawyer, and John Hutchinson, of the Parliamentary Army, were married in it; while a memorial to the comedian, John Emery, who died in 1822, states, "Each part he shone in, but excelled in none So well as husband, father, son"; while Benjamin Disraeli's name appears among the entries of baptism. The advowson of the church is in the gift of the Dukes of Buccleuch.

It is disappointing that in so many of his larger churches Wren should have fallen back on somewhat commonplace solutions, but his powers of design were evidently at their best when he had to face exceptional difficulties caused by site or the circumstances attending unusual constructive problems.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS:

FACTORIES AND WORKSHOPS.

A MEETING of the Institution of Municipal and County Engineers was held in the Town Hall, Acton, recently; Mr. H. J. Wakelam, M.Inst.C.E., County Engineer of Middlesex, President, presided.

Mr. F. Sadler, Surveyor to the Acton authority, read a paper on the "Duties of a Municipal Engineer in connection with Factories and Workshops." After speaking of the dual control of factories by the officers of the local authority and by the factory inspectors of the central authority, which was apt to lead to confusion and overlapping, as it was also a source of irritation to the occupiers of factory premises, he summarised the duties of the municipal engineer as follow:—

(1) The examination of plans of new factories and workshops, or additions and alterations to existing ones, and the supervision during construction, to see that the buildings are erected in accordance with the Public Health Acts and the building by-laws and regulations in force in the district.

(2) The inspection of factories and workshops, to ascertain whether there is sufficient and suitable sanitary conveniences for the employees.

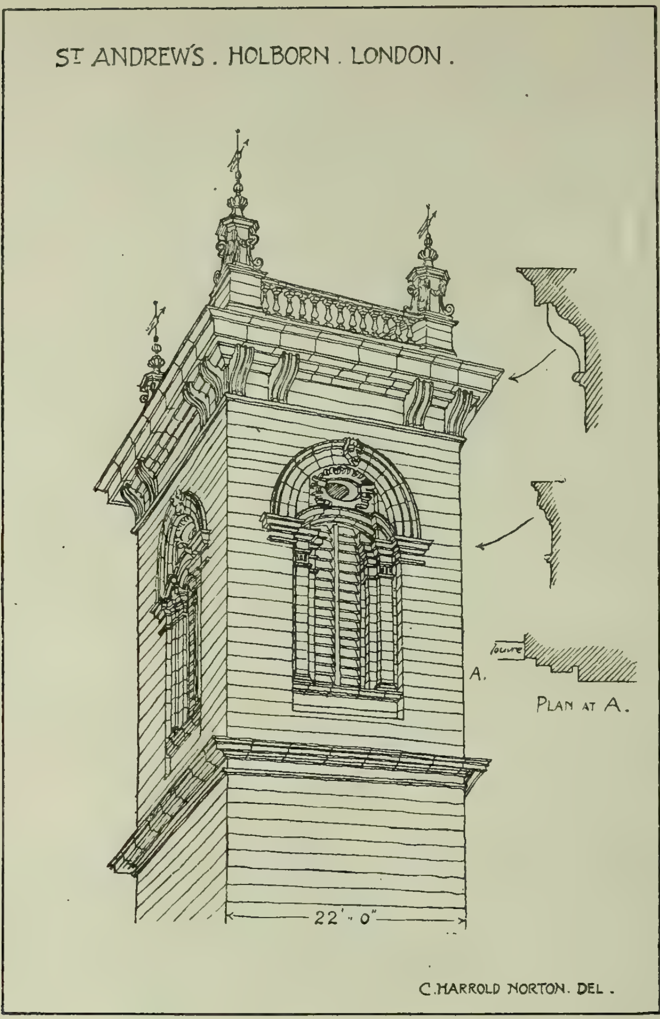
(3) The inspection of all factories and workshops wherein more than forty persons are employed, to see that they are provided with such means of escape in case of fire for the persons employed therein as can reasonably be required.

(4) Inspection with a view to preventing any injurious matters entering public sewers from factories and workshops.

(5) The inspection of factories and workshops where petroleum is stored with a view to licences being granted by the Council.

With respect to the erection of factories and workshops, he said the erection of such buildings in a district must conform to the building by-laws in force therein.

It would accelerate and regularise these methods of building if the Regulations and section of the Act, which are based on many years' experience and settled after careful deliberation and collaboration by experts, were made applicable to the whole country, either by a general Building Act or by means of by-



laws. The latter method would be preferable. The Regulations require plans and sections to be deposited of sufficient detail to show the construction of the proposed building, together with a copy of the calculations of the loads and stresses to be provided for and particulars of the materials to be used. The adoption of these Regulations by urban and rural councils would add materially to the work and responsibility of the Surveyor both in the examination of deposited plans and particulars and also in the supervision of the work, but it would clear away an anomalous position of affairs.

Mr. R. Brown (Southall) said the question of factories in districts around the Metropolis was a most important one. Acton was not the only place by any means where factories were going up *ad lib.*, and they were all met with the difficulties which Mr. Sadler had mentioned in his paper. In dealing with factories generally, it must be a matter of policy as to whether factories should or should not be allowed in any particular district. When a council decided to put in force the Town Planning Act and decided to develop a district partly for factories and partly for residences they must be prepared to accept and take the advantages and disadvantages of those factories. As to by-laws to allow the erection of buildings other than brick or stone work, such as concrete and steel-framed buildings, he warned Mr. Sadler as to adopting the London County Council Regulations for reinforced concrete buildings unless he obtained the whole of the powers given by the Act which permitted those regulations to be made. He did not think any reasonable local authority would object to their erection so long as they were designed by responsible engineers and supervised by proper men. Once they had in black and white the right to erect these buildings they had the responsibility of seeing they were subject to proper supervision. If a district allowed a factory to be erected, then it ought to be compelled to take the waste from the factory. It ought not to allow a factory to be erected and then refuse to take the waste.

Mr. E. Willis (Chiswick) considere
paper to be opportune at a moment w
many factories were being erected for m
works. With regard to the mixed supe
of factory buildings by the Public
Department, the Municipal Engineers' I
ment, and the Government Factory Ins
he thought it a pity that there should b
than one authority. Supervision wa
crux of the whole matter in regard to rei
concrete buildings. If a structure wa
designed and the erection of the buildi
thoroughly supervised there was very
danger of its ultimate future. His own
gave temporary licences for these bu
under the 1907 Act for varying periods,
ing to the nature of the building. Un
licence they had power to give notice o
drawal in the event of the building s
signs of weakness. There had up
present been minor settlements, but r
requiring the withdrawal of a certificat
to the danger from fire, the trouble was
much with new buildings, but with ad
to old buildings, which blocked up op
This required constant supervision. H
from 200 to 300 factories under supe
and there had been structural alteratio
minor character required in about half
buildings. He was not in agreement w
Brown, that a factory should have th
to discharge its refuse through the se
the council. Why should one facto
entitled to do great injury to the ratep
There must be some means of mec
separation or filtration of dangerous
entering through the sewers.

Mr. A. E. Collins (Norwich) said his
had hundreds of factories surround
houses. It was a most inconvenient a
ment for workpeople going to and fro.
absolutely imperative to have by-la
dealing with these places. They wer
pletely hemmed in, and it was imposs
get additional exits. In many cases it w
necessary to go the length of putting u
forced concrete, as corrugated-iron bu
were quite sufficient.

Mr. H. York (East Barnet Valley) sa
working of the 1907 Act appeared to hin
a travesty of the law. Many of these bu
were not temporary—they were inten

NERAL NEWS.

Greenock Housing.

special meeting of Greenock Corporation agreed to appoint four councillors and ster of Works as a deputation to the ice of the National Housing and Town g Council to be held in London from 1 to 14. Provost M'Millan stated that result of the last housing inquiry at k they were already committed to an ture of about £100,000, and as soon as was over no doubt the Local Government would again press upon them the y of looking after the needs of the in the way of new and better housing odation.

The White Tower, Salonika.

the Army Headquarters at Salonika Ward Price sends some interesting specting the White Tower. He says :— ika is passing through a period of Even the White Tower itself is being ised. From the time the Venetians 500 years ago until the Turks left it in t Balkan War it was an object of well- d awe. The grim old tower is now no ormidable than the Crimean cannon l in English corporation parks. Electric d water are laid on inside. The battle- are used by our sailors for a signal On the second story of the Tower English institution is installed. The around Salonika is rich in archæological , and has never been properly explored. lied armies decided to take steps to the relics that they found for the of the Greek Government, to whom iscoveries naturally belong. A well- English professor of archæology was ready as a lieutenant in the R.N.V.R., was put in charge of the collection of finds, which he is arranging as a local ogical museum in the White Tower."

British Columbia Timber.

rsuance of the policy of market expan- the interests of the lumber industry, ken by the Hon. the Minister of Lands, , British Columbia, two further bulletins, d for the information of lumber con- have recently been printed. They titled "British Columbia Douglas Fir ion" and "British Columbia Western ne" respectively. The former publica- als with the qualities of Douglas fir for ral purposes. The bulletin is well ted, the claims to durability being ed by pertinent references to such gs as the Craigflower Farm near Victoria, in 1851, and the Craigflower Public built in 1853, Douglas fir having been hroughout except for the roof of red hingles, and practically no parts of the gs having had to be repaired. Modern Douglas fir for structural purposes are ed by reference to the Arcade Building vernment and View streets, Victoria, in 1915, and the new Wharf Reception Canadian Pacific Railway Dock, ver. Another reference is to the Gulch trestle on the Esquimalt and o Railway, built in 1896. Four hundred g, 120 ft. high, and on a 10-deg. curve, ing three-quarters of a million feet of s fir, the trestle was still in excellent on and good for further years of service t was abandoned sixteen years later, to the alteration in grade. The wood variously as Western Soft Pine, in Western Pine, Arizona White Pine, lifornia White Pine is described in a manner in the publication, "British ia Western Soft Pine." This pine, is distributed throughout the southern of the province, is equal in working nishing qualities to the well-known White Pine, and is now being sold for ne purposes in the same markets. Its r dimension and framing timber, siding, and exterior finish, ceiling and par- work, sash and doors, turnery, patterns, terial, cooperage, etc., are touched upon text, while all processes of conversion strated.

Painter-Stainers' Hall.

The Painter-Stainers' Company held a luncheon on Tuesday, March 28, on the occasion of the completion of alterations and additions to their Hall, which have been carried out by Mr. Searles-Wood, F.R.I.B.A. We hope to have an opportunity of describing the work done in detail in our series of numbers dealing with the City Companies and their Halls, merely saying here that the work has been well considered and excellently carried out, and reflects credit on the Company and their architect. A collection of the original charters of the Company, including those granted by Elizabeth and James II., were on view in the fine Courtroom, and the assembled company, which included the Lord Mayor of London and the High Commissioners of Australia and New Zealand, had lunch in the Livery Hall, after which several excellent speeches were delivered.

Rodin's Sculptures.

A Reuter telegram from Paris states that M. Rodin has now made over his collection to the Government by deed of gift, together with the Palais Biron, where these works are assembled, which will shortly be opened to the public under the name of the Musée Rodin. The sculptor retains his studio in the building, but all the rest of the extensive building and its grounds with all their artistic equipment becomes public under Government supervision. It may be recalled that in 1914 M. Rodin gave to the British nation twenty examples of his work, including a replica of the famous group, "The Burghers of Calais."

Statue to Nurse Cavell.

Two years will be occupied in the completion of the memorial to Nurse Edith Cavell, for which a fund is being raised by the *Daily Telegraph*, but the bust which Sir George Frampton has first made, as a preliminary to the statue, has been sent to the Royal Academy. The site for the memorial is the island in the middle of the road opposite the National Portrait Gallery. The memorial will face south, and, being of a commanding height (33 ft.), will be seen from Trafalgar-square and even Whitehall. The figure of Edith Cavell, in nurse's uniform, will look towards Charing Cross Hospital, the white marble statue, 8 ft. in height, being outlined against a silvery-grey granite column. This monument, something of an obelisk in shape, will be crowned by the figure of Justice and Humanity seated, a sword across her knees, guarding an infant. The chair of Justice will have great arms which jut out on either side, so that in the distance the monument will bear the semblance of a cross, the nursing symbol. At the back a lion, in white marble, stamps upon a serpent.

Scientific Research.

At a meeting of the Council of the Institution of Municipal and County Engineers, held at Westminster on the 18th ult., it was reported that representatives of the Institution had met representatives of the Research Council, and that the question of scientific research in connection with the following subjects was discussed, viz. :—

1. The utilisation of a larger proportion of the calorific value of house refuse than is possible with apparatus and methods at present in operation, either by (*a*) an improved form of destructor, (*b*) the production of power gas from crude or disintegrated refuse, or (*c*) some other means.
2. The utilisation of tins by the introduction of a simple and effective detinning process and other improved methods of treatment.
3. The more thorough utilisation of clinker from refuse destructors.
4. The utilisation of sewage sludge.

The representatives of the Research Council stated that they would be willing to discuss, at a later date, any definite detailed scheme the Institution might put before them, dealing with the utilisation of house refuse and clinker, but they suggested that, in the first instance, the Institution should collect, tabulate, and analyse as far as possible, full information as to what has already been done in this direction. On the question of sewage sludge, it was also suggested that the Institution should collect information with a view to the drafting of a comprehensive scheme for research work.

The *Punch* War Cartoons.

An exhibition of the original drawings for *Punch* cartoons on the war by Bernard Partridge, L. Raven Hill, and F. H. Townsend will be opened on Saturday, April 8, at the Leicester Galleries, Leicester-square.

A Chamberlain Memorial.

A memorial bust of Mr. Chamberlain, which has been erected in Westminster Abbey by private subscription of a few intimate friends, was dedicated on Friday last week. Mr. Balfour performed the unveiling ceremony. The bust is by Mr. John Tweed, and is placed on the north side of the Abbey, near the monument of the late Lord Salisbury.

Standardisation.

At a meeting of the Standardisation Committee of the Institution of Municipal and County Engineers, held on March 18, a letter was read from Mr. J. S. Pickering, drawing attention to the standard form issued to members of the R.I.B.A., and suggesting that the Council should issue a similar form to the members of the Institution. It was resolved to recommend that a copy of the R.I.B.A. Form of Articles be supplied to each member of the Committee before the next meeting.

Industrial Progress and State Aid.

At the annual meeting of the Society of British Gas Industries on March 29 Mr. H. M. Thornton, the Chairman of the Council, delivered an address on "The Industrial Outlook and its Relations to the Gas Industry." Speaking of the proposed State assistance in industry he said: "I am not enamoured of the proposal to create a new Ministry of Industry and Commerce independent of the Board of Trade. In the multitude of Ministers there is weakness. I would prefer to see instead an enlargement of the Commercial Branch of the Board of Trade, which has done much valuable work during the war. I would like to see that branch extended so as to be an industrial and commercial department of the Board, and strengthened by being put under the control of a council of a few—a very few—men of wide business experience and proved business capacity, with adequate salaries and required on appointment to relinquish all business connections. . . . It is imperative that the administration of the Department of Industry and Commerce should be kept free from party influences and be carried on by business men on business lines. . . . In short, we want a State Business Building Department, with the time, ability, and power to organise to the full the maximum output and export of our various industries."

The British Fire Prevention Committee's Warning Service.

The British Fire Prevention Committee's fire warnings, which have been issued since the outbreak of war, cover a number of matters that require the attention of the public with the object of reducing the ordinary fire waste, as also points which will assist them in meeting the air raid danger. In addition to these general notices which have been made available to the public numerous special warnings have been issued by the Committee to meet individual interests, such as those of the hospital manager, the schoolmaster, the theatre owner, etc. Turning to the air raid danger, the Committee's warning No. 17A appears to be the favourite, and their circulars No. 18A or No. 18B refer to the general air raid question and the ordinary householder's aspect respectively. There are a number of special notices which are only issued to the proper competent authority or responsible applicant writing over his own signature from his regular address. No. 24 is only issued to ministers of religion in charge of places of worship; No. 20 only to education authorities, headmasters, and headmistresses of elementary and secondary schools; and No. 21 to managers of theatres, music halls, and cinema houses. Application must be made in writing with a large-sized stamped and addressed envelope enclosed for the reply. Requests should be addressed to the Registrar, The British Fire Prevention Committee, 8, Waterloo-place, London, S.W., and both the nature of the notice and the reference number of the warning must be given.

CHADWICK PUBLIC LECTURES.

In the concluding lecture of the series of Chadwick Trust Lectures on "The Domestic Arterial System," delivered on Wednesday, March 29, at the Household and Social Science Department, King's College for Women, Campden Hill-road, Kensington, Mr. John Slater, F.R.I.B.A. (Chadwick Trustee), in the Chair, Dr. Charles Porter dealt with warming and lighting. In connection with the former he criticised the methods usually adopted, and referred to the various advantages claimed for, and the disadvantages urged against, coal, coal gas, and electricity as heating agents. He expressed the view that of the three that which most deserved the claim of being a hygienic heater was undoubtedly electricity. As regards safety, cleanliness, and convenience it was ahead even of gas, in favour of which so many claims were advanced. In the matter of cost he showed that, so far as electricity was concerned, installation was the great trouble; but where there was choice in any house between coal, coal gas, and electricity he advised that it should fall on the last-named. The many advantages of central heating were also referred to, and it was made clear that much could be said in favour of its adoption even in the case of ordinary-sized houses. The cost of installation probably deterred many from resorting to it, though possibly the fact that, comparatively speaking, the temperature of London is so equable may induce a feeling that complete house heating is unnecessary.

The problem of the kitchen range was touched upon, and the suggestion was offered that in these days of gas and electric cookers and hot water heaters it might very conveniently be abolished. One of the great difficulties in the way of abolition was the necessity for a fire in the kitchen. In this connection an appliance specially designed for use as a combined sitting-room fire, cooker, and water-heater was described and greatly praised, being cheap to purchase and install while economical and efficient in use.

In relation to lighting, the ordinary artificial agents were described and their comparative advantages and disadvantages considered. The methods of installation were indicated, and a number of slides and models shown. In the view of the lecturer, electricity was the only hygienic artificial lighting agent. In regard to natural light the fact that the most effective light came through the upper part of the window was indicated, and a number of objections, in regard to safety and comfort chiefly, were shown to exist to the practice of bringing the window too close to the floor level.

◆

OBITUARY.

Mr. C. Hadfield.

Last week we announced the death, on March 23, at his residence in Norfolk-road, Sheffield, of Mr. Charles Hadfield, aged seventy-five years. He was the son of the late Matthew Ellison Hadfield, of Sheffield, architect, and the representative of the old Derbyshire family of Glossop, who latterly were of Lees Hall, Simmondley. His father, with whom he was associated in practice, was closely connected with the management of the local estate of the Duke of Norfolk. Mr. Hadfield was educated at St. Cuthbert's College, Ushaw, Co. Durham, and was a pupil of John Gray Weightman and of George Goldie. He was elected an Associate in 1863, and a Fellow in 1872, of the Royal Institute of British Architects, and served as a member of Council 1896–7; he received a certificate of competency to act as a building surveyor under local Acts of Parliament. He was a co-founder, in 1886, and Fellow, Past-President (1896–7), and Vice-President of the Sheffield Society of Architects and Surveyors. In 1897 he took into partnership his son, Mr. Charles Matthew Hadfield, under the style of Messrs. C. & C. M. Hadfield, of Sheffield. He was many years a member of the old Council, Sheffield School of Art; he succeeded his father as treasurer and co-manager of St. John's Institution for the Deaf and Dumb, Boston Spa, and he was President of the Sheffield Committee of the Society of St. Vincent de Paul.

Mr. Hadfield was largely employed upon ecclesiastical and other buildings, which he designed chiefly after the Perpendicular or Tudor manner for the Roman Catholic community, to which he belonged. Still, as our own columns testify, his professional labours were by no means confined to that field. With his father he was the architect of the Roman Catholic Churches of St. James, Marsh-lane, Liverpool (March 27, 1886, interior*), and St. Ignatius, Preston (October 2, 1886*). He was the architect of the Roman Catholic Churches of St. James, Bootle, St. Vincent, Sheffield (new aisle), and, with his son, of St. William, Banner Cross, Sheffield; and of St. Anne, Buxton—interior decoration, with marble floor and mosaic pudelia; for the completion, with tower, nave, and north aisle (July 25, 1908*) of St. Mary's Church, Stockton-on-Tees, begun by A. W. Pugin in 1841 and continued by G. Goldie in 1875; sale shops and artisans' dwellings, Infirmary-road, and Lock-street, for the Sheffield City Council, and St. Mary's new parish church, Wombwell, Yorks—chancel, organ-chamber, and vestries; he designed St. Marie's Roman Catholic Church, Sheffield, and also the altarinos or shrines of the Blessed Virgin and the Sacred Heart (November 6, 1886*), and the memorial to his father; and, in Sheffield, the large business premises adjoining the London City and Midland Bank, and the Drill Hall, and the following, as illustrated in our issue of October 9, 1897, No. X. of our series, "The Architecture of our Large Provincial Towns," namely, premises in High-street; Corn Exchange (with M. E. Hadfield); Cairns Chambers, Church-street, modern Gothic mode; cemetery gateway, etc.; and Nurses' Home, laundry, and other buildings for the Royal Public Hospital and Dispensary; also in Sheffield the Gas Company's offices; new premises for Messrs. Pawson & Brailsford; the new King's Head Hotel; Church Gates Buildings; and many Roman Catholic schools, including those of St. Wilfrid, Heeley, and St. Edmund, Sheaf-gardens; the Royal Hospital; Manor Public Elementary Schools; factory at the Moor for Messrs. J. Pickering & Sons, Ltd.; laying out of the new Intake Cemetery, with Roman Catholic mortuary chapel; Crematorium, City-road Cemetery, for the Corporation (July 30, 1904*), the two chapels and the entrance gates and offices being by M. E. & C. Hadfield, and the Roman Catholic Clergy House and Rectory, Norfolk-street. He was the architect of the churches at Handsworth and Wath; of many school-chapels and other buildings at Derwent and elsewhere in Derbyshire, to harmonise with the local work of the sixteenth and seventeenth centuries; Great Northern Hotel, Leeds (before the fire), and for the rebuilding of Thornbridge Hall, Bakewell. Messrs. C. & C. M. Hadfield w
second premium in the Sheffield (Pri
meadows) Public Baths competition
Hadfield was the architect, jointly wi
Garland, for the reconstruction (1898)
nave, aisles, and tower and spire of Wor
parish church, for which he complet
scheme (as mentioned above) six years
wards. He was the author of papers r
the Sheffield, York, and Manchester S
of Architects upon "The Architecture
Fifteenth-century and Early Tudor P
"English Architecture of the Fi
Century," and "True Building"; and
upon "Lead Work," read to the Sheffi
Crafts Guild. Mr. Hadfield married, in
Miss Rimondi, of Halifax, and leaves tw
and three daughters.

ILLUSTRATIONS.

The New Technical Institute, Cardiff.

THIS building was opened on the 13th ult., the Right Hon. the Lord Mayor of Cardiff, Dr. R. J. Smith, performing the ceremony. On the previous Saturday the South Wales Institute of Architects were conducted over the building by the architects, Messrs. Ivor Jones & Percy Thomas.

Owing to the European War the completion of the building has been greatly delayed, and owing to the same cause the furnishing has had to be postponed, temporary rough furniture being used for the rooms required for immediate occupation, while the Chemistry Department, engineering workshop, and laboratory, bakery and electric engineering laboratory, etc., will not be used for the same reason.

The building faces the King Edward VII. Avenue, in Cathays Park, Cardiff, adjoining the Glamorgan County Hall, and opposite the University College of South Wales and Monmouthshire. The building roughly forms three sides of a square, the fourth side forming the future extension, which will add about one-fifth to the floor area of the present building. It is faced on the three principal sides with Portland stone from the quarries of F. J. Barnes, of Portland.

The whole of the bricks were obtained locally from the Phœnix Brick Works.

The floors throughout are of 6-in. concrete between rolled-steel joists, these and the steel roof principals, etc., having been supplied by Messrs. A. D. Dawnay & Sons, Ltd., of London and Cardiff.

The main roofs are covered with Dolemaen silver-grey random slates, and the other roofs are covered with Portmadoc blue slates, both being supplied by Messrs. Sessions & Sons, Ltd., of Cardiff.

The halls, corridors, lavatories, etc., are finished with terrazzo flooring, supplied and laid by the Marble Mosaic Company, of Bristol.

The floors of the rooms are finished with pitch-pine wood blocks, supplied and laid by Mr. J. F. Ebner, of London.

The heating and ventilating of the building has been designed on most up-to-date principles. The heating consists of hot water apparatus worked from central boilers with accelerated circulation. This system provides a particularly uniform temperature throughout the building, and also economises the consumption of fuel. Provision is made for working in sections, and also for shutting off any portion not required.

For the ventilation of the building fresh-air inlets are provided in connection with the radiators, each inlet being under control. The vitiated air is extracted through various openings into sub-ceilings and ducts communicating to two large exhaust fans. A separate fan is also provided for the ventilation of the central hall and a further ventilating fan for the lavatories.

In the Chemical Department, in addition to the ordinary ventilation of the laboratories, a special fan is provided for extracting the fumes from the fume closets, this being kept quite distinct from the general ventilation of the building.

This system has been designed and carried out by Messrs. G. N. Haden & Sons, engineers, Trowbridge.

The sanitary goods throughout have been supplied by Messrs. Shanks & Co., Ltd., Bond-street, London.

Amongst other sub-contractors may be mentioned the following :—

Messrs. George Wragge, Ltd., of Manchester—Steel casement windows throughout, leaded lights, wrought-iron balustrading to main and secondary staircases, bicycle entrance, etc.

Messrs. Smith, Major, & Stevens, of Northampton—Goods hoist.

Messrs. Henry Hope & Sons, Ltd., Birmingham—Patent roof glazing.

The British Luxfer Prism Syndicate, Ltd.—Pavement lights.

Messrs. Ewart & Sons, Ltd.—Lightning conductors and copper flagstaff.

North of England School Furnishing Company, of Darlington—Folding partitions.

Messrs. H. W. Cashmore & Co.—Lead rain water-heads.

The Cardiff Gas Company—Hot water heater.

Mr. James Gibbons, of Wolverhampton—Door and window furniture, etc., throughout.

Messrs. Alfred Brown & Co., of Birmingham—Gearing to lantern lights.

The De Lank Quarries, Ltd., Cornwall—Granite curbing around building.

Messrs. John P. White & Sons, Ltd., Bedford—Oak fencing and gates.

Messrs. John Williams & Sons, Ltd., of Cardiff—Various castings, storage tanks, etc.

Messrs. D. Morgan & Sons, of Cardiff—Fireplaces, sinks, etc.

The electric light installation was carried out by Messrs. H. J. Cash & Co., of Westminster, under the supervision of the City of Cardiff Electric Light Department.

The main staircase is constructed of reinforced concrete on the Hennebique system, and was carried out by the general contractors. The stone carving to main entrance, etc., was carried out by Mr. Albert H. Hodge, of London, and the fibrous plaster work to the assembly hall by Mr. T. A. Jones, of Cardiff.

The general contractors for the building were Messrs. E. Turner & Sons, Ltd., of Cardiff, who have been contractors for the majority of the buildings in Cathays Park, and the architects were Messrs. Ivor Jones & Percy Thomas, also of Cardiff, who won the competition for the building in 1911.

The clerk of works was Mr. W. R. Irwin, of Malefant-street, Cardiff.

Wren's Churches.

WE give an illustration of St. Andrew, Holborn, reproduced from "The Churches of Sir Christopher Wren," by Mr. J. Clayton, published by Messrs. Longmans, Green, Brown, & Longmans, which we give by the courtesy of Messrs. Longmans, Green, & Co. We also give a reproduction of a sketch of the tower of St. Alban, Wood-street, by Mr. Harrold Norton. Further notes on these churches will be found on page 261.

Design for New Secondary School for Girls at Luton.

IN order to reserve the largest area possible for the playing-fields and playgrounds advantage was taken of the fall of the ground from north to south of the site, some 15 ft., to plan a lower ground-floor story towards the Marlborough-road boundary, containing the school entrance lobby and staircase approach to the upper ground floor, the bicycle-room, the boiler house, and coal store, the large cloak-room, and the covered playground. With these exceptions the whole of the school accommodation is arranged in a group of one-storied structures, the floors of which are slightly above the level of the ground at its highest point. It was found that under the general scheme of plan thus evolved the assembly hall could be placed either at the extreme northern boundary of the school buildings, as in scheme A, or, as in sche in a central position between the twelve ventilated classrooms that face east and and are approached by open arcaded cor Connected by open lobbies and placed ea west of the main structure are two sub blocks of buildings, that on the east cont the school dining-room, kitchen, service and caretaker's quarters, and that on th the chemistry laboratory and lecture-roo the laboratory for physics and botany.

Provision is made in the playing-fiel a full-size hockey-ground and for four and one hard tennis courts in addition asphalted playgrounds, each about 150 75 ft. The requirements of the Bo Education and the conditions of the c tition were rigidly fulfilled.

LEGAL SECTION.

ES ON CURRENT CASES.

orth *v.* Battersea Borough Council: Misfeasance or Nonfeasance.

IS action, which has passed through more than the usual vicissitudes of a case before the courts of law, reached rt of Appeal for the second time in er last, and its decision has recently blished in the legal reports.

laintiff, a lady, when riding her bicycle Lombard-road, within the borough of ea, in order to escape collision with a , passed over the grating of a gully as connected with the public sewer in e roadway. In doing so the plaintiff own from her bicycle, and, the wheels carriage going over her, she sustained njuries, for which she sought to recover s from the defendants. It was alleged e defendants were liable in damages accident, both as highway authority sanitary authority, owing to their ce in allowing the gully and grating to w the level of the road surface, in not the grating in proper repair, and in ing it to be in a dangerous condition.

defendants disclaimed liability (*a*) as way authority, on the ground that the of their predecessors—the Wandsworth Board of Works—had never been red to them; and (*b*) as sewer authority, they had been guilty of nothing more nfeasance.

action was first tried by Mr. Justice e with a common jury in December, 8 J. P. 173), when the jury found that the plaintiff's accident was caused ding over the gully; (*b*) by the negligence the road authority and the sewer y in allowing the gully to be below ining road surface; (*c*) by the negligent tion of the gully itself by both the road sewer authorities; (*d*) by the negligence defendants both as road and as sewer y in not remedying the defect of the ing below the roadway; (*e*) by the frame ully grating being broken, and, further, und that the defendants both as road ewer authority were guilty of negligence epairing it.

ury assessed the plaintiff's damages at Upon these findings of fact by the e learned judge held that the original e construction of the gully was done by andsworth District Board of Works, re the defendants' predecessors in title o were constituted both the road and er authority for the road where the happened by the Metropolis Manage- ct, 1855; and he further held that the orth District Board remained liable matters which occurred during their tration, and that their successors were ble only for the exercise of the powers red to them by the amendment to the lis Management Act of 1888 and by of the London Government Act, 1899, t by these Acts the liability for the defective construction of the gully er transferred to the defendants. In sition as sewer authority the learned eld that the defendants were liable gence in not seeing that the inequality urface levels, owing to their gully being below the roadway, was remedied, and gence in not repairing the broken gully. position as road authority he was of that the defendants were not liable or the gully being below the level of lway or for not repairing the broken Judgment was accordingly entered for ntiff for £1,961 with costs.

defendants appealed on the ground ere was no evidence before the jury e status of the defendants under which trolled the gully and that no question to the jury as to whether the defendants had the means of knowing, or ought to have known, of the defect in the gully. The defendants also alleged that no directions were given by the learned judge to the jury to address their minds to this question in answering the question as to negligence.

The appeal was heard in November, 1914 (79 J. P. 105), and a re-trial of the action was ordered upon the grounds that the jury ought to determine whether the gully was a thing for which the road authority were responsible to the exclusion of the sewer authority, or for which the sewer authority were responsible to the exclusion of the road authority, or for which they were both responsible, for the reason that if the gully was vested in them as road authority the defendants would not be liable for mere nonfeasance, and upon the further ground that, if it should be found that the defendants were responsible for the gully as sewer authority, it ought to be determined—in order to ascertain whether there was actionable negligence—whether the defect was known, or with reasonable diligence would have been known to the defendants.

Lord Justice Buckley (as he then was), in his judgment, said the jury had found that the accident to the plaintiff arose through her riding her bicycle over the grating, but the defendants contested the view that the condition of the grating or its position relative to the surface of the roadway caused her fall. As to the question whether the defendants were liable as a road authority or as a sewer authority it should be borne in mind that the sewer was laid in 1865, but the road itself was not made until 1883. The first thing to be determined, therefore, was whether the gully and grating were controlled by the defendants as road authority or as sewer authority, or by them in both capacities. If the grating belonged to the defendants as road authority then, following the decision in the case of Cowley *v.* Newmarket Local Board ([1892] A. C. 345), if this were mere nonfeasance—that is, if they did not replace the broken frame if it was broken, or if they did not raise the sunken grating if it was sunken, and so on—they would not be liable. Upon the other alternative, supposing that the defendants are rendered liable as the sewer authority, it must first be ascertained whether they have been negligent as such sewer authority, and they will not have been negligent unless they knew, or had the means of knowledge, or ought to have known of the defects in question.

To the question, "Was the accident to the plaintiff occasioned by the negligence of the defendants in not remedying any defect in the gully owing to its being below the roadway (*a*) as sewer authority or (*b*) as highway authority? the jury answered "Both," without discriminating between the responsibility of the defendants in one or other character. That is, the jury said that in as far as the accident was due to the gully grating being below the roadway the defendants were negligent in both capacities. As to the broken condition of the grating, the jury only found that it contributed to the accident, but they did not say that it would have happened apart from the grating being broken. In these circumstances he was quite unable to understand whether the jury meant that the accident was caused by the dishing of the gully, or the sinking of the gully, or the broken frame, or some or which of them. There was also a question of mixed law and fact upon which the differing responsibilities of the defendants as road authority or as sewer authority rested, viz., was this grating a thing for which the road authority was responsible to the exclusion of the sewer authority, or were the sewer authority responsible for it to the exclusion of the road authority, or were they both responsible for it? The fact was that when the road was made in 1883 the granite setts with which it was paved and the gully in question were both put in, and the expense of so doing was apportioned over the frontagers under the powers given by Act of Parliament; but upon this the question was whether the road authorities bought and put the gully in, and, when it was put in, who had control over it. He thought that *primâ facie* the grating formed part of the surface of the road; it was put there to support the carriage or foot passenger who is passing, and it was pierced for the purpose of allowing water to pass through it into the sewer; but it was a question which should have been left to the jury to find as fact whether the grating formed part of the sewer or part of the road. Supposing it was as sewer authority that the defendants were responsible, then the negligence alleged must be proved against them, and negligence depends upon knowledge or means of knowledge. If there is neither one nor the other, even although you owe a duty, it may not be negligent not to perform it, and upon the assertion that the grating was defective and a portion of it actually wanting the question of knowledge was material.

As a result of the decision of the Court of Appeal the case was re-tried in February, 1915 (79 J. P. 309), by Mr. Justice Scrutton, with a special jury, and this jury found (1) that at the time of the accident a piece of the frame of the grating was missing; (2) that the grating itself was not dangerous to a careful cyclist; (3) that the danger was due to the original placing of the grating in an excessive depression and not to any subsequent alteration of position; (4) that the plaintiff's injuries were not caused specifically either by the broken frame or by the dangerous condition of the grating; (5) that the plaintiff could not have avoided her fall or injury by the exercise of reasonable care and skill, considering the presence and position of the carriage and the state of and depression in the road; (6) that the grating was part of the road, that it was placed in the road by the Board of Works for the Wandsworth district, that it was paid for by the frontagers, but was controlled by the road authority; (7) that at the time of the accident neither the road authority nor the sewer authority nor their servants knew or could have known of the defect in the grating by the exercise of reasonable care. In answer to a supplemental question the jury found that the accident was caused by the broken frame and grating being in an excessive depression.

Mr. Justice Scrutton said he understood the findings of the jury to be that there was no settlement of the gully after its original construction, that the frame of the grating was broken and part of it missing, but that the broken part was so full of detritus that it was not negligent not to have discovered that it was broken. They accordingly found that the accident was caused by the original construction of the channelling, gully, and grating, the grating being so much below the level of the surrounding road that it was a danger; but they also found that, although it was a danger, it was not negligence not to have seen that it was a danger, although the learned judge concluded that they thought it was a danger. The persons who carried out the original construction of the gully and grating in the roadway were the Wandsworth Board of Works, who are two removes from the present defendants. The present defendants are the successors of the Vestry of the parish of St. Mary, Battersea, and the Local Government Act of 1899 transferred to the defendants not only the property but the liabilities of the Vestry, but in the Act which turned the Wandsworth Board of Works into the Vestry of St. Mary, Battersea, there are no express words transferring liabilities to the Vestry. Mr. Justice Horridge had decided that the liabilities of the Wandsworth Board were not transferred to the defendants on the general principle that when you retrospectively want to transfer liabilities you must do so by clear words, and he, Mr. Justice Scrutton, did not propose to interfere with that decision. It therefore follows that a previous road authority having put down a dangerous grating—dangerous, that is, by reason of the difference of level between it and the road—their successors in duty have done nothing to alter it. Doing nothing on the part of a road authority is, however, not actionable, and there is not even a finding that this doing nothing was negligent, because there is an express finding that the defendants neither knew nor by reasonable means could know of the defect, if any. Consequently, assuming that the plaintiff's injuries can be ascribed to the road authority, the plaintiff must fail, because she has not established any misfeasance on the part of the defendants as a road authority. He thought there was an obligation upon a road authority to use reasonable care in the construction of roads, but they were not called upon to warrant the safety of the road, and if a defect not discoverable by reasonable care caused an accident they would not be liable. If, therefore, it was not negligent not to have foreseen the danger resulting from the difference in level, it was questionable whether even the Wandsworth District Board would have been liable for their original construction. He held that the jury had not found that the defendants were negligent as a sewer authority, because although they found that there was a default it was not such a default as reasonable care could have avoided. A road, he said, that has a hole in it would be a dangerous road, and in his view a grating put over a hole through which surface water is removed from a road becomes part of the road, and it is there to afford safe transit along the road. He considered it an extremely unsatisfactory state of things that there should be this difference between liability as road authority and liability as sewer authority, but the remedy is for Parliament to step in and put the road authority in the same position as the sewer authority. He therefore gave judgment for the defendants with costs, including the costs of the first trial.

From this decision the plaintiff appealed, and the matter came before the Court of Appeal for the second time on December 3 and 6, 1915, and is reported in [1916] 1 K. B., p. 583. For the plaintiff it was then argued that the original placing of the frame and grating in the dangerous condition they were was an act of misfeasance for which the Wandsworth District Board would have been liable if any accident had occurred, and it could not be contended that the liabilities of the Wandsworth Board did not pass to their successors and to the defendants.—Lord Justice Pickford said the case had been made somewhat difficult owing to some confusion in the findings of the jury, but he thought the effect of them was that the accident was caused by the undue depression of the grating below the surface of the road causing a steep decline, that that depression was a part of the original construction, and that the defendants were not negligent in not having discovered that that extreme depression was dangerous. It was said that the jury impliedly found negligence on the part of the Wandsworth District Board in constructing the gully in the way they did, but in his opinion if negligence is to be relied upon as the foundation of an action it must be expressly found. The evidence was that this method of construction both of the grating and frame and of the adjoining parts of the road was the universal method of construction at the time according to the state of skilled knowledge then existing, and he thought there were probably thousands of similar gullies still remaining in the London district. It is quite possible, he said, to have a thing which experience shows to be a danger and yet there may not have been any negligence in first constructing it. The position, therefore, is that the Wandsworth District Board, exercising proper and reasonable care and skill, constructed, about thirty years before this accident happened, a grating in a manner which was not negligent, but which the jury found in the circumstances of this case to be dangerous. The Wandsworth Board had carried out their statutory powers in a reasonably careful and skilful manner, and he did not think that there was an absolute duty imposed upon them of making the road safe. If a local authority do something which afterwards turns out to be dangerous, but in doing it they exercise reasonable care and skill, in his opinion they are not responsible. If the state of things had been such that as time went on it became clear that the grating so placed was dangerous, and if the local authority who laid it or their successors allowed it to remain so, they might be responsible, because it might be said that they were negligent in not having altered it; but, as he took the view that the Wandsworth District Board would not have been liable, it was not necessary to inquire whether any liability was transferred to the defendants. Lord Justice Bankes concurred, and Mr. Justice Neville said that even though the grating was so constructed in 1883 that many years afterwards it proved to be a danger to cyclists, that would not be such a misfeasance as would make the road authority liable unless they had failed to take reasonable care in the original construction.

The appeal was accordingly dismissed, and the judgment of Mr. Justice Scrutton for the defendants in the second trial was affirmed.

From the point of view of the general public it is very unsatisfactory to find that because a part of a road is controlled by a road authority no compensation can be obtained for an accident due to their not bringing their constructions up to date and that they are only liable when they actually do something in a careless or unskilful manner perhaps thirty years before an accident occurs, whereas when the same authority acts as a sewer authority they may be liable if they allow their works to remain in an antiquated and dangerous condition. There is little hope that the observations of Mr. Justice Scrutton as to the present unsatisfactory state of the law on the matter will receive the attention of Parliament during the continuance of the war, but it is a matter which will require serious attention at the earliest available opportunity.

LAW REPORTS.

KING'S BENCH DIVISION.

(Before Mr. Justice DARLING and a special jury.)

Corporation Sued for Negligence: The Public Trustee v. Torquay Corporation.

THIS was an action tried at the recent Devon Assizes by Mr. Justice Darling with a special jury, in which the Public Trustee, in whom were vested eight houses at St. Michael's-terrace, Torquay, claimed damages against the Corporation of Torquay for alleged negligence, whereby a wall belonging to the plaintiff fell and damaged his property. The damages were agreed at £350, subject to liability being found.

Mr. Clavell Salter, K.C., M.P., and Mr. J. G. Pease appeared for the plaintiff; and Mr. J. A. Hawke, K.C., and Mr. Harry Geen for the defendants.

Mr. Clavell Salter said the houses in question were built in the year 1878, and at the rear was a passage giving access to the back entrances. The site being upon a hillside, the ground had been terraced, and a facing wall of about 20 ft. in height was built against the embankment at the back of the passage. The houses drained into a sewer laid in the passage, and in the year 1914 questions arose as to the state of the drainage, but after some correspondence it was agreed that the owner of the houses was responsible for the drains as far as the sewer, but that the Corporation were responsible for the line of sewer itself. After investigation the Corporation decided to relay the sewer, and the work was carried out in September, 1914. The old pipes were taken out and new pipes were laid in the same line of trench. The plaintiff alleged that the work was negligently done, as in February, 1915, the greater part of the facing wall came down with a crash and did a great deal of damage and destruction. The case for the plaintiff was that the trench was cut too close to the facing wall, that it was improperly timbered, and that the trench had been opened out in one length instead of in sections.

Mr. C. S. Appleton, architect, Torquay, gave the results of his inspection immediately after the wall had fallen. He came to the conclusion that the collapse was not due to a landslide, but that it was caused by interference with the foundations of the wall in digging the trench and in not timbering it. The reason he assigned for the wall not falling for five months after the completion of the work was that the ground was able to support the weight of the wall until the wet weather came, which loosened the ground and allowed
the foundations to slide. He did not

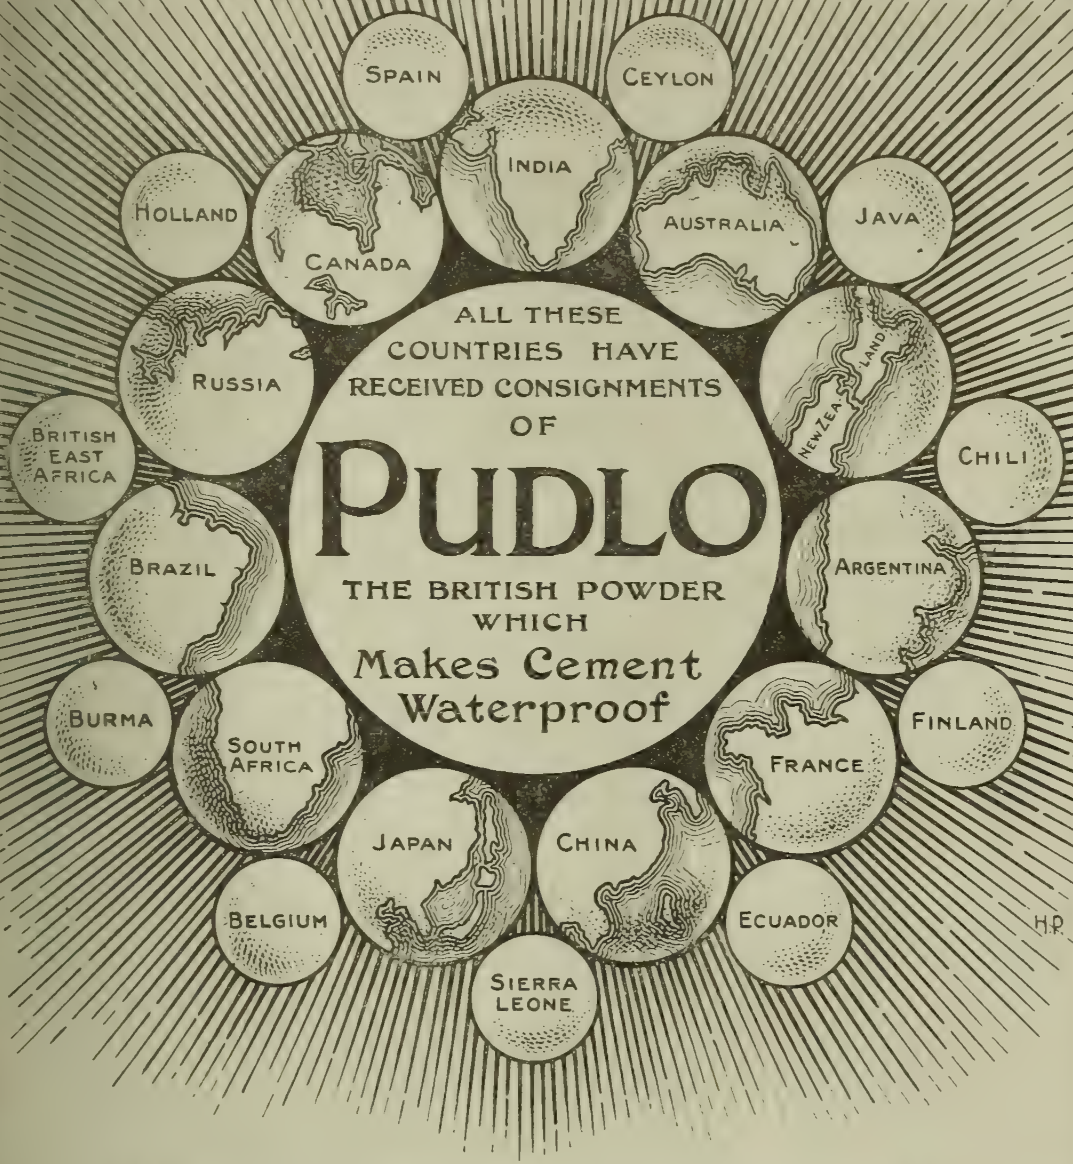
COURT OF APPEAL.

(Before the LORD CHIEF JUSTICE, Lord
WARRINGTON, and Mr. Justice SCRUT

The Reconstruction of a Theatre; Ac Structural Engineers: George Lands & Son, Ltd. v. Man Palace of Varieties, Ltd.

THIS case was heard on the 27th ul
the appeal of the defendants from a ju
of Mr. Justice Rowlatt in the action wh
brought against them by Messrs. Geo.
& Son, Ltd., structural engineers, of
Nottingham, arising out of a contract
internal reconstruction of the Ma
Palace Theatre.



The confidence engendered by the use of a well-tried product.

So many Architects specify PUDLO when there is the least fear of dampness—and for flat roofs—that it is becoming rare to meet an Architect who has not used, or intended to use, PUDLO.

First used at Swansea for the cement flat roofs of the Corporation Cottages in 1908, the progress of this invention has been one continual stride forward. It has been exported into 38 foreign countries, including those shown above. In some of these markets there has been strong opposition, but PUDLO has invariably maintained its British character as the best waterproofer. Almost every British Government Department has tested it and specified it.

All scientific and practical tests prove it cannot affect cement detrimentally even after a prolonged period. (*Ask for the New Booklet, Free.*)

BRITISH! It always has been British.

Manufactured by Kerner-Greenwood & Co., St. Ann's, King's Lynn.

Mr. Cyril Atkinson, K.C., for the appellants, said Mr. Justice Rowlatt awarded plaintiffs in the action £514. Plaintiffs claimed for the balance of money alleged to be due on a contract under which they undertook the delivery and erection of steelwork necessary for the internal reconstruction of the theatre, the entire inside of which was being taken out and a new interior fitted. The only point raised by the appeal was with regard to £350, representing an allowance provided in the contract of £50 a week for each week by which plaintiffs anticipated the contract time. Plaintiffs claim to have anticipated the contract time by seven weeks. The claim was based first on a certificate, but that failed. Alternatively the plaintiffs claimed that the money was due under the contract. No evidence was given that the contract had been anticipated by seven weeks, but it was alleged that defendants' architect agreed that the contract time should be extended in such a way that plaintiffs gained seven weeks. Defendants denied the alleged agreement or that the architect had any authority to make it.

Mr. Parfitt, K.C., for the respondents, said that no such point as that there was no agreement was raised at the trial. If the point had been raised as a point of law it was unthinkable that the Judge would not have dealt with it. He relied upon the arrangement which eventuated in an extension of the contract time.

The Lord Chief Justice, in giving judgment, said the question was what was the agreement which was eventually arrived at, long after the contract had been made between the parties, as representing the date from which the plaintiffs' work was to commence? By the contract the materials were to be ready for despatch from the works not later than May 26, 1913, and by another clause the lifting of the steel structure was to commence on June 24. At some date in August, 1913, there was an agreement to vary it, and this seemed to be quite clear between the parties. The only question was what was that agreement. It was quite clear there had been delay, and the difficulties which arose resulted in the agreement, that agreement being that the time was to be extended so that the date of commencement should be August 20. The real dispute was what was the meaning of commencement of the work dated from August 20. Did it mean that the whole of the work from May 26 was to commence from August 20, or only that the lifting of the auditorium steel was to commence on August 20? The learned Judge, in the Court below, found that the "commencement" referred to was the beginning of the work undertaken in pursuance of the contract. Therefore the whole of the work was to commence from August 20 in order to arrive at the time that was saved. If that was right, the appellants were wrong. He (the Lord Chief Justice) had come to the conclusion that there was evidence upon which the learned Judge was entitled to decide that the agreement, in fact, applied to the extension from May 26, and therefore there was no ground for disputing the decision in that Court. There was another point that the architect had no authority to make such an agreement. It was objected that this point was not at issue before the learned Judge at the trial. The real question in dispute before the Judge was what was the true agreement arrived at, and on that point his Lordship held that the appellants did not succeed. The judgment must stand, and the appeal dismissed.

Mr. Justice Warrington and Mr. Justice Scrutton concurred.

OFFICIAL REFEREE'S COURT.

(On March 13.)

(Before Mr. VEREY.)

Vinson v. Lord Molesworth.

IN this action Mr. Vinson claimed £600 odd from Viscount Molesworth for dilapidations under a repairing covenant of an agreement under which Lord Molesworth, in October, 1907, took a country house called Walters Hall at Monkton, near Margate. The agreement was made with the defendant's predecessor in title, Mr. Lewis, and was for three years certain with an annual occupation afterwards, subject to six months' notice in writing.

Under the covenant upon which the action was brought the tenant agreed that he would forthwith, upon the signing of the agreement, put the place in thorough repair. It was a very old house, dating back to the eighteenth century, added to in 1852, and, on account of its condition and the repairing clause, was let at the reduced rental of £60 a year. When the tenancy was about to expire a notice was served in March, 1914, and Lady Molesworth was written to by the plaintiff's solicitor—Lord Molesworth being away in India at the time—pointing out that the premises were in a dilapidated state and likely to become worse, as they had been left without occupation. After some correspondence, Mr. Jennings, a surveyor, went over the premises and made a schedule of the repairs which he believed to be necessary.

Mr. Joseph Jennings, a surveyor, of Canterbury, was called, and said that, after studying the terms of the agreement, he made his survey, and found that a large sum of money would have to be spent upon the premises before they could be again occupied. He subsequently prepared a schedule of dilapidations, and had fixed the cost at pre-war prices, which amounted to £601 15s.

The witness was cross-examined at length upon the details of his requirements, and he admitted that some of the items were simply deductions from what he saw. For instance, he had put down the renewal of greenhouses which appeared to have existed against a wall, and he had claimed for the reinstatement of vines in a vinery, and of rose-trees, which appeared to have been removed. He said they were rose-trees because the removals had been from the rose-garden.

Lady Molesworth, giving evidence for the defence, said they spent between £200 and £300 upon repairs before they went into the house, and more while they were in occupation. She thought the £600 ought to be enough to buy the house right out. Lord Molesworth was at present on military duty, serving in the R.F.A. Reserve at Salisbury.

The Official Referee pointed out that the house was an old one, and said that the repairing covenant must be read having regard to the age of the house and the class of persons who would be likely to occupy it. It had been unoccupied for several years before Lord Molesworth took it, and had not been occupied since he (Lord Molesworth) left it.

In giving judgment the Official Referee said that the property consisted of a house, stables, and outbuildings, and a garden of about two acres. The house had been built about 200 years ago and additions had been made to it about sixty years ago. Mr. Lewis, who was the owner at the time the agreement was entered into, stated that it was then in a wretched state of repair, and had been unoccupied for a long time, that he would then have taken £1,500 for the freehold. Lord Molesworth took the house on a three years' tenancy at £60 per annum, a reduced rent in consideration of his having undertaken to put the premises in repair upon entering into possession. He remained in possession until 1914, and in the meantime, in November, 1913, the property had been sold to the plaintiff. The evidence of Mr. Lewis, who was owner up to that time, was that he visited the premises several times, and that the suggestion by the plaintiff that no money had been spent upon them was untrue, as he was more than pleased with the steps taken by the defendant to put them in order. When he last visited the premises in 1912 he thought that the tenant had thoroughly performed his contract to repair. Mr. Lewis was an independent witness and had an interest in seeing that the tenant performed his covenant, and it was clear that he kept an eye upon what was being done. Lady Molesworth said that she had spent £200 on the initial repairs, that the outside had been painted twice during the tenancy, and that upwards of £300 had been spent on the property. In comparing the evidence for the plaintiff with that for the defendant it was clear that the plaintiff's surveyor was mistaken when he said that no repairs had been done, and he (the Referee) thought that he had adopted a very high standard in his estimate and in his prices. The evidence satisfied him that the place was in a better condition at the termination of the tenancy than at the beginning, and he could not understand how £600 or any such sum could be required. But if a tenant committed a breach of covenant to repair the landlord was not compelled at once to do the repairs, and was entitled to judgment for damages. After careful consideration of the whole of the evidence, and on looking at all the facts, he found that some repairs were necessary, and that the defendant had failed to carry out the covenant, and, after making proper allowance for the rise in prices, he found that the plaintiff was entitled to recover as damages £150.

Judgment was accordingly entered for the plaintiff for £150, with costs.

NEW COMPANIES.

THE undermentioned particulars of companies recently registered are taken the Daily Register compiled by Messrs. J & Sons, Ltd., Company Registration A Chancery-lane, W.C. :—

R. BARTON, ADAMSON, & CO., LTD. (14 Sandringham Works, Enfield-highway, E Registered March 8. To carry on bu of makers and repairers of motors and cars, vans, lorries, fire engines, and carriages of every description, dealers accessories and outfits, oils, lubricants engineers, builders, contractors, steel fou etc. Nominal capital, £2,000 in 2,000 £1

MATTHEWS & CO. (MARGATE), LTD. (14 133, High-street, Margate. Reg March 9. To carry on business of d furnishing and general warehousemen, fu and fittings, engineers, contractors, gas land, house, and estate agents, builder Nominal capital, £2,000 in 2,000 £1 shar

BROWN HALLS, LTD. (143,266), 2, Half lane, Eccles, near Manchester. Reg March 11. To purchase or acquire a lea plot of land in Church-street and Corpo road, Eccles, with the electric picture thereon, to enlarge, reconstruct, etc. theatre, to build, etc., other theatres and carry on business of theatre pro and managers, etc. Nominal capital, in 2,000 £1 Ordinary shares.

BARWICK & PROSSER, LTD. (143,287). tered March 15. To carry on busin general carriers by land and water, and forwarding agents, etc., smelters, b contractors, engineers, tool makers, ste iron founders, gas makers, etc. N capital, £10,000 in 10,000 £1 shares.

T. BROOK & CROWTHER, LTD. (14 Registered March 15. To carry on b for the manufacture of machinery fo ing and preparation of gun cotton, and explosives, etc., mechanical engineers founders, tool makers, and brass fo builders, electrical water supply en etc. Nominal capital, £3,000 in 3,000 £1 s

BURT & SON, LTD. (143,297). Reg March 16. To carry on business in the Kingdom and elsewhere of exporter importers of coal, timber, iron, slate building materials of all kinds, carriers and water, dealers in bricks, tiles, terra-cotta, china and earthenware go every description, contractors, builders neers, etc. Nominal capital, £15,000 £10 Ordinary shares and 750 £10 Pre shares.

COOKE'S (FINSBURY), LTD. (143,298). tered March 16. To carry on busi manufacturers of and dealers in fu upholstery, etc., stoneware and metal earthenware, builders, glaziers, plumbe and electric light engineers, water and engineers, etc. Nominal capital, £15, 6,250 £1 Preference shares and 8,750 £1 O shares.

CYMOGRAPH, LTD. (143,323), Bu House, Cannon-street, E.C. Re March 18. To carry on business of me engineers, manufacturers of implemen other machinery and utensils, brass fo metal workers, builders, electrical en carriers, merchants. Nominal capital, in 1,000 £1 shares.

W. D. PEATTIE & CO., LTD. (1 Registered March 21. To carry on of builders, contractors, decorators, me dealers in sand, stone, lime, bricks, hardware, and other building requisites, house agents, valuers, surveyors, s electrical lighting, water and general en Nominal capital, £500 in 500 £1 shares

MARCHBANK, BAINBRIDGE, & CO. (M BROUGH), LTD. (143,368). Re March 23. To acquire, take over, an on business of coal merchants and owners carried on at Middlesbro Marchbank, Bainbridge, & Co., collie quarry proprietors, iron, steel, and metal and mineral merchants, dealers stone, lime, slate, gravel and general requisites, timber merchants, haula tractors, etc. Nominal capital, £2, 2,000 £1 shares.

THE BUILDING TRADE.

HNICAL INSTRUCTION IN BUILDING.

'R. J. LEASK MANSON B.Sc.Eng., (Lond.), recently read an excellent paper on "The Future of Technical ion in Building" at the Municipal al School, Leicester, which was fully ed by diagrams which we regret have space to give. In the course of arks he pointed out the deficiencies ow exist. We are heartily in agreement l he said, more especially with the s which we have italicised.

me deal with a series of facts which are less interdependent," he said, "but wing to their ramifications and the acute l feelings which their discussion generuses, will require me to use (in a mixed e like this) all the tact and discretion h I am capable. I refer now to the ition which in the interests of building on should exist amongst employees, rs, architects, and building teachers. ng first with the attitude towards l education of those employed in the building trades, we come into contact ny facts which to us as teachers are lisconcerting and a few which are ging.

ally speaking, what we know as the trades" in building are almost comprehended in the various trade hence we may consider first the official of these unions, and secondly the attitude of the individual workman.

ne who has been actively associated trade union, and who is a strong bei their necessity and in the undoubted which accrue to their members, it has keen disappointment to find so few and dging references to the value and need ical education for the craftsman. *ay search trade union literature in vain official discussion of the value of education orker, which includes a serious and conreference to technical education. Almost exception the unions show no interest t improvement, restricting themselves to the wage question, workshop conditions, and unemployed benefit, and political*.

are all undoubtedly important things, ink it is a disaster, both to themselves the nation, that they have almost failed to realise that in education, technical education in particular, they nd a mighty lever to raise the status British workman, not only financially, as a craftsman and as a citizen.

rgument is usually advanced that the and-butter questions" absorb all their and that they are "at war" with loyers; but such a plea is no more than is the ill-considered and cheesepolicy now being followed by the ent and by many education authorities g technical education throughout the during the present great crisis. If gs any benefits at all, it ought at least away our sluggishness and stimulate arpen up the tools of peace as well as pons of war.

gst the individual craftsmen the tale is same. All of us could relate instances r own experiences where young and g students have been so ridiculed and in the shop about their attendance echnical school that they have fallen ver to return. This ought not to be. *inding conditions of modern competition rapid growth in strength of the trade urnish the masters with their excuse they do not take more interest in technical n in building.*

dition, we frequently hear the plea l that, since an apprentice usually the close of his apprenticeship, the annot be expected to put himself out of the way concerning the apprentice's instruction for the future as a craftsman beyond what he can pick up in the shop and on the buildings. This and a disbelief in the value of technical instruction work mightily against us.

Fortunately, there are some shining exceptions amongst both masters and men. I could give you extracts from Mr. Smail's Report, in which local branches of various building trades unions offered ready support to new building classes which it was proposed to institute at that time. On many technical and advisory committees throughout the country union representatives have sat alongside the masters and have worked with them in the common cause. At my own school in Leicester the Joiners' Society two or three years ago offered, on their own initiative, to provide special prices for students in the Building Trades Department who were joiners. During the last three months it has been my privilege to sit on the Building Trades Advisory Committee of the City and Guilds, under the chairmanship of Mr. Holliday, of Messrs. Holliday & Greenwood, London, who represents on that Committee the Institute of Builders, and who has for ten years been Chairman of the Governors of the Brixton School of Building, and I am sure that no one could wish for a more sympathetic, broad-minded, and enthusiastic chairman for such a Committee.

Considering next the attitude of the architects to the general technical instruction of those entering building, as distinct from the special training of the architect, there is, I think, a general tendency to give way to a professional pride, which looks askance at the trade-student who studies Building Construction in order to widen his outlook, or at the architectural student who attends trade classes in order to improve his grip upon the details of construction.

Architects are not alone in being at fault through professional pride, but at a time when the architectural profession is claiming more and more to control even the most minute details of construction, and is robbing the craftsman of his few remaining opportunities for showing some initiative, it would be disastrous were they to cut themselves entirely away from the rest of the industry and to hold themselves as a class apart. Their artistic training is, of course, something apart from the training required by the average craftsman, but it is at least shared—or ought to be—by the plasterer, the stonemason, and the decorator; and if their complaint now is that workmen are lacking in the architectural sense and in the personal initiative which characterised the workmen of days now past, then let them realise that both the cause and the cure rests in part with them. The status of the building industry can only be restored if all take their due share of the responsibility of the training and preparation of the coming generations of craftsmen, builders, and architects.

I propose to discuss in the remaining portion of this paper a series of problems of particular interest to the building teacher, and my opinion of his merits and his powers of solving these problems will be indirectly stated there, but I would like to say here just a word or two concerning his general attitude towards co-operation with the sections of the industry which I have already mentioned.

Generally speaking, he is willing and anxious to co-operate, but there are times when perhaps he remembers that in his young and enthusiastic days he sought the aid of the local people and they responded enthusiastically, and possibly formed a building advisory committee, which committee either found an early grave or else grew up so vigorously as to eclipse entirely his own little shining light.

He now says that such co-operation can only be expected when everybody is perfect, forgetting that when such times come the need for advisory committees will apparently not exist.

Generally speaking, however, the building teacher is a man of great faith. His difficulties are many, his encouragements few. He is content with the brief words of gratitude that he occasionally receives from a considerate student, remembering—like a true philosopher—that not many of his students are able to analyse their careers and rightly assess the undoubted benefits which they receive from conscientious technical instruction.

One of the most gratifying features about the Bournemouth Vacation Course, and one which—speaking quite frankly—was probably a great surprise to all concerned, was the hearty and unlimited spirit of co-operation which was shown and which immensely increased the efficiency of the work. Both parties, of course, sent out patrols on the first encounter, and a few shots were exchanged, but the serious purpose and the obvious anxiety evident on both sides to work for the common good removed all further doubts, and the work proceeded with delightful smoothness and regularity to the end.

Without further elaboration, I think I may take it as agreed that before any really complete advance can be made in the matter of technical education in building there must be hearty and ungrudging co-operation between all concerned, mutual suspicions must be removed by generous and frank discussion, and finally each party must try to enter as fully as possible into the difficulties to be faced by the others.

Turning next to some problems with which the building teacher himself has to grapple, you will not misunderstand me if I say that I would have preferred to have devoted my paper entirely to these matters, excepting that I think it is as well that we should realise that there are very important factors outside the schools which have exercised great, and are likely to exercise still greater, influence over our work in the future if progress is to be made.

I have already mentioned that one of the facts which we must carefully consider is that in the last twenty or thirty years improvements in trade practice and in methods of construction that have sprung up within the industry itself have been few and of minor importance. So far as my knowledge carries me such things as wood-working machinery, improvements in workshop control, reinforced concrete, steel construction, methods of waterproofing, of lighting and heating, have originated in the mind of the specialist and the engineer much more than within the industry itself, which has rather accepted these things at first, as bread from heaven—with some initial scepticism—and with the ever-present feeling that they represent the last word in these matters and that nobody but a crank would try and devise further improvements.

My reading of the situation may be wrong, but I feel that in the past the teacher of building has devoted himself too exclusively to constructive detail and too little to those basic principles of physical knowledge from which—if widely disseminated amongst all engaged in the industry—might have sprung inventions and reforms such as have revolutionised engineering during the last twenty years. In addition, the artistic aspect of the crafts should have received more attention.

The drift of my argument will be obvious to most of you, and I need not labour the point further. The recent emphasis upon the need for special instruction for the building student in geometry, mathematics, and science, as applied to building problems is, I think, an advance from which much may be expected in the future. The scheme of work which was studied at Bournemouth was entirely based upon these ideas, and while—for reasons which I cannot enter into here—the work was only discussed so far as it affected the first-year classes of a Senior Course—corresponding to your third year—the general ideas and methods of attack were sufficiently clear to enable the scheme to be applied to later years. But it is necessary to utter some warnings. No man, or group of men, however brilliant or capable, could devise a scheme at the outset of a new movement which could be applied universally without readjustment or alteration. And, while I think it is thoroughly sound to obtain first a good grip upon some such complete scheme—whether it is issued by the Board of Education, propounded at a Vacation Course, or devised by some body like the U.L.C.I., is to some extent a matter of indifference—its chief value lies in its power to enable a man to test new ideas, to discard that which is useless, and to incorporate everything that makes for real progress.

But let us not deceive ourselves. It is not an easy task to devise special classes for building students in mathematics and science, and to revise the other subjects so as to fit into the whole scheme. It is easy to lift chunks from ancient syllabuses on Practical Mathematics, Elementary Physics, Mechanics, Chemistry, and Strength of Materials, but that is not sufficient.

It is essential that the whole scheme be sound from an educational point of view, and that there should be clear ideas as to the preliminary training of the student before he reaches the building teacher, so that he should know how to link on his work to that already done by the student; utilising the student's present fund of knowledge, intensifying the glow of his present interests, and welding the new knowledge to the old. In addition, in arranging the work in the building classes there must be no patchwork, but each item treated must go—in a very definite way—to complete the whole structure of the course. These are a few of the problems which were dealt with at Bournemouth.

The scheme of classes there discusssed was, in outline at least, very similar to that now issued by the U.L.C.I., so that I need not detail it here, but I would like to deal now with a matter which has so far not received much consideration—that is the position occupied by the trade classes under such a scheme.

The general suggestion is that in the early years—your third and fourth years—professional and trade students should combine to take a group course separating later into special trade and professional classes. With certain reservations, this, I think, is an excellent arrangement, particularly in the light of the present situation—*i.e.*, that with a small and apparently decreasing attendance we have attempted to keep up a large number of separate trade classes. This cannot go on indefinitely.

It is my firm conviction that many of our trade syllabuses are on wrong lines; they are too ambitious and too comprehensive. If I were not likely to be misunderstood, I would say that we try and introduce too much pseudo-science, which is of little value to the trade student as such. A trade class is not the place to teach elementary science, but rather affords an opportunity of showing the application of science to the trade. There is room for much reform here."

The lecturer concluded by saying:—

"Above all else, the building teacher of the future must be a big-souled man; his outlook must not be limited by bricks and mortar or by examination results, but he must be able to feel that he is engaged in helping forward one of the most ancient activities of man, which has, as history shows, risen to sublime heights as a visible expression of the nobility of nations now dead; and which, let us hope, will rise to even greater heights, as the national expression of the purified and ennobled British Empire which we all pray may emerge from the tremendous struggle now proceeding."

We have omitted much of a thoughtful and useful paper, but we can be of most service in emphasising our conviction that reform can only arise through the enlargement of the horizon of the trade unionist by the recognition of other factors than wages or self-interest, and by the architect's recognition of the worker as a co-operator and not a simple mechanical executant of orders. The one way is more difficult initially than the other, but only by its means can progress in art be effected. As it is we frequently hear the methods of the past extolled, while those who appreciate these merits do not appear to try to produce an amelioration of existing conditions.

NEW GOVERNMENT CONTRACTS.

War Office.

Nails (Term Contracts).—Guest, Keen, & Nettlefolds, Ltd., Castle Works, Rogerstone, Newport, Mon.; Rylands Bros., Ltd., Warrington.

Paint.—Blundell, Spence, & Co., Ltd., Beverley-road, Hull; Burrell & Co., Ltd., West Ferry-road, Millwall, E.; Colthurst & Harding, Ltd., Alpha Wharf, Millwall, E.; Cowan Bros., Ltd., Magnet Works, Marsh Gate-lane, Stratford, E.; J. S. Craig & Co., Ltd., 97, Portman-street, Glasgow; J. Foulger & Sons, Seven Star-alley, St. George-street, E.; Golden Valley Ochre and Oxide Company, Ltd., Wick, Bristol; J. Hare & Co., Temple-gate, Bristol.

Paint, etc. (Term Contracts).—L. Berger & Sons, Ltd., Homerton, N.E.; Brimsdown Lead Company, Ltd., Brimsdown, Middlesex; Colthurst & Harding, Ltd., Temple-gate, Bristol; Mersey White Lead Company, Ltd., Warrington; Rowe Bros. & Co., Ltd., Old Quay Lead Works, Runcorn; Walkers, Parker, & Co., Ltd., Lead Works, Chester.

Piping and Fittings, Metal.—Scottish Tube Company, Ltd., Clydesdale Tube Works, Rutherglen, Glasgow, etc.; Stewarts & Lloyds, Ltd., Dalmarnock Bridge, Glasgow.

Pumps, etc.—Hayward-Tyler & Co., Ltd., 99, Queen Victoria-street, E.C.; Ingersoll-Rand Company, Sale, Manchester; Lee, Howl, & Co., Tipton; Merryweather & Sons, Ltd., Greenwich-road, S.E.; Pulsometer Engineering Company, Ltd., Nine Elms Ironworks, Reading.

Tools.—Alldays & Onions Pneumatic Engineering Company, Ltd., Birmingham; Armstrong, Stevens, & Son, Ltd., Walsall-road, Willenhall; A. Ashton & Sons, Ltd., Burnt Tree Works, Sheffield; H. Barnard, Plough-lane, Homerton, N.E.; J. Bedford & Sons, Ltd., Ball-street, Sheffield; W. G. Birkinshaw & Co., Reliance Works, Wolverhampton; B. Bladen & Son, Halesowen, Birmingham; C. H. Blakeley & Sons, 165, Napier-street, Sheffield; F. J. Brindley & Sons, River-lane, Sheffield; Brooks & Cooper, Mousehole Forge, Sheffield; J. Brooks (Lye), Ltd., Brook-street, Lye, Stourbridge; Carr, Wild, & Co., Ltd., Egerton-street, Sheffield; C. Churchill & Co., Ltd., 9/15, Leonard-street, Finsbury, E.C.; Drabble & Sanderson, Morpeth-street, Sheffield; J. Evans & Sons, Ltd., Highfield Tool Works, Heeley, Sheffield; B. Fiddian & Son, Stourbridge; W. Gaythwaite, The Forges, Cleator, Cumberland; Hardy Patent Pick Company, Ltd., Heeley, Sheffield; J. Hill & Sons, Mounting Works, Lye, Stourbridge; W. Hunt & Sons (The Brades), Ltd., Brades Steel Works, Birmingham; Lawson & Heaton, Ltd., 315, Long-acre, Nechells, Birmingham; Lockwood Bros., Ltd., Spital-hill, Sheffield; E. & W. Lucas, Ltd., Dronfield Forge and Shovel Works, Sheffield; M. Mellor & Sons, Ltd., Lee Works, Nottingham; Midland Manufacturing Company, Celtic Works, Sheffield; W. Mills & Co., Woodhouse Mill, Sheffield; Motor Stamping Company, Long-acre, Aston, Birmingham; Mountfor, Phillips, & Co., Ltd., Thoms Works, Brierley-hill; I. Nash & Sons, Ltd., Wollaston Mills; Stourbridge; J. Peace & Co., Ltd., Rutland-road, Sheffield; S. Peace & Sons, Ltd., Wellmeadow-street, Sheffield; W. K. & C. Peace, Ltd., Rutland-road, Sheffield; J. Perks & Sons, Ltd., Monmore Green Works, Wolverhampton; J. W. & H. Platt, Byron Works, Bouverie-road, Harrow; G. Plumpton, Ltd., Albion Works, Warrington; Portable Furnace and Patents Company, Ltd., Carrington, Nottingham; J. Powell, Ltd., Oxford-street, Birmingham; Ruston, Proctor, & Co., Ltd., Lincoln; Sanderson Bros. & Newbould, Ltd., Newhall-road, Sheffield; Sheffield Hack Saw Company, Bridge-street, Sheffield; T. Smith & Sons (Saltley), Ltd., Saltley Mill, Birmingham; Spear & Jackson, Ltd., Aetna Works, Savile-street East, Sheffield; J. H. Swift & Sons, Ltd., Penistone-road, Sheffield; Swindell & Co., Ltd., Withymoor Works, Netherton, Dudley; Taylor Bros., Adelaide Saw Works, Sheffield; C. Thomas & Co., Ltd., Aston Manor, Birmingham; L. Thomas & Co., Coaley, Dursley, Glos.; G. Thornton & Co., Ltd., Tividale, Tipton; J. Tyzack & Son, Ltd., Meersbrook Works, Valley-road, Heeley, Sheffield; W. Tyzack, Sons, & Turner, Ltd., Little London Works, Sheffield; S. Vaughan, Ltd., Henry-street, West Bromwich; Ward & Payne, Limbrick Works, Hillsborough, Sheffield; C. Whitehouse & Sons, Ltd., Cannock; J. Wilkinson, jun. (Dudley), Ltd., Freebodies Works, Dudley; G. Wolfe & Sons, Ltd., Bathgate; F. Wood & Sons, Thorpe Works, Henry-street, Sheffield; Wynn, Timmins, & Co., Ltd., Commercial-street, Birmingham.

PROPOSED NEW BUILD
AND OTHER WORKS

In these lists care is taken to en
accuracy of the information given, bu
occasionally happen that, owing to
owners taking the responsibility of com
work before plans are finally approve
local authorities, "proposed" works
time of publication, have been actua
menced. Abbreviations:—T.C. for
Council; U.D.C. for Urban District
R.D.C. for Rural District Council;
Education Committee; L.G.B. for
Government Board; B.G. for B
Guardians; L.C.C. for London County
B.C. for Borough Council; and P.C. fo
Council.

Argentina.—The *Boletin Oficial*
Aires) of February 10 publishes a
approving a project prepared by the "M
de Relaciones Exteriores y Culto" re
the construction of a hospital in
(Misiones) at an estimated cost of 346,
currency (about £30,300).

Bexhill.—Plans passed by the T.C.:—
house, Terminus-avenue (Mr. G. E. M
Mr. H. P. Farnfield; detached house,
drive (Mr. G. E. Maynard), Mr. P.
pair of cottages, Cooden Sea-road
Stevens & Son), Miss G. Kershaw; add
"Deema," Sea-road (Mr. G. H. Gra
L. M. Williams; detached house in
drive (Messrs. Tubbs, Messer, & Poult
F. J. Browell; garage at "The Corn
Cooden Sea-road (Messrs. Tubbs, M
Poulter), Mr. H. Turner; coal store, 6
ham-avenue (Mr. J. B. Wall), Mrs
Walker; hand lift at rear of 12, Clif
(Messrs Upfield & Sons), Messrs
Stapylton-Smith. Temporary building
shed, Little Common-road, for Mrs
Escombe; and a motor house, 72, Stat
for Mr. H. W. H. Palmer.

Buckingham.—At a recent meeting
R.D.C. the Clerk produced the draft of
ment between Mr. Jones and the Cha
reference to a portion of a field they
chased for the proposed new isolation ho
Gawcott. The matter was referred
Committee.

Cornforth.—The Sedgefield B.G. has
plan for an additional classroom at the
Hall, Cornforth.

Coventry.—Plans approved by the
Works Committee of the City Counci
houses (amended), Kingsland-avenue, fo
Barrett; hutment, Stoney Stanton-road
Young Men's Christian Association; or
Rochester-road, for Mr. T. F. Bird; tw
Binley-road, for Mr. C. Blockley; add
premises, Far Gosford-street, for M
Perkins & Co.; laboratory, Cash's-lane
Standard Motor Company, Ltd.; ar
room, etc., Edgewick Works, Canal-road
Alfred Herbert, Ltd.; store shed, Upp
street, for Mr. Alfred Herbert, Ltd.; ca
shop, etc., Cash's-lane, for the Standa
Company, Ltd.; six houses, Queen Ma
for Mr. J. Clifton; factory Hawkins-
the Metallurgical Company; two
houses, Churchill-avenue, for Mr. J. W
four houses, Collingwood-road, for M
Hewlett; building line, etc., Stoney
road, for Mr. Alfred Herbert, Ltd.; i
Harnall-lane, for Messrs. Bretts'
Company

Dundee.—At a Dean of Guild Cour
Mr. James Williamson Masson, Nee
applied for permission to convert the
second floors of his property in County
two dwelling-houses, and to make imp
on the ground floor of the licensed
known as the Burns Tavern, and to er
façade to the ground floor. The p
passed.

Fulham.—We understand that Mr
Stoll has purchased a portion of the si
ham on which dwellings for disabled s
to be erected, and has made a gift o
to the fund.

Glasgow.—The following linings h
granted by Glasgow Dean of Guild Co
James Johnston, C.A., 190, West Geo
Glasgow, and others, to erect a recre
and rooms in Craigmont-drive, Mar
Clyde Structural Iron Company, Ltd.,
Iron Works, Scotstoun, to erect bu
South-street, Scotstoun; the Cassel Cya
pany, Ltd., 19, St. Vincent-street, G
make extensions to their still and roas
in the works in Shuna-street, Glasgo
John Broadfoot & Sons, Ltd., Inchho
James-street, Whiteinch, to erect a
there; Scottish National Council of Yo
Christian Associations, 118A, George-st
burgh, to erect a temporary institu
corner of London-road and Sum
Glasgow.

Goole.—The U.D.C. has approved of
a new power station at Rawcliffe

Holmfirth.—A L.G.B. inquiry has
in connection with the U.D.C.'s propo
for working-class dwellings.

India.—The waterworks scheme o
Municipality has received the adm
approval of Government.

---

* See also our list of Competitions, Co
on page 272.

n.—A scheme for the improvement of dy-street area has been prepared by the Green B.C.

esbrough.—At a recent meeting of the brough Plans Committee plans were i of a new internal arcade on the of Messrs. Dickson & Benson, Ltd., in e-road. Mr. James Forbes, architect, d a set of plans for the Britannic Shoe y, who are about to open premises in e-road.

Zealand.—With reference to the raising of £115,000 for the purpose of carrying ain public works at Auckland, over will be spent on the Council's market undertaking. The City Engineer has a report in regard to city improvement and other desirable works which should e attention of the Council during the years.

wshire.—A L.G.B. inquiry has been ating to an application by the Upper Committee of Renfrewshire for authority re a town-planning scheme for the of Cathcart, Eastwood, and Mearns, g Clarkston, Busby, Giffnock, Thornlie- d Newton-Mearns.

.—The U.D.C. has approved the follow- s:—Mr. W. Wiggins, for additions to morton-road; Messrs. G. W. & F. for three houses on Park-road.

y.—The U.D.C. has approved the plan sed bungalow abutting on Dudley-road ed by Colonel Nayler).

—The *Gaceta* of March 13 notifies that will be opened on April 15 by the muni- horities of Mota del Marqués (Province dolid) for the construction of a new t that town, at an estimated cost of setas (about £3,260).

g.—The T.C. has granted a warrant to James Ronald & Sons, civil engineers, s. and surveyors, to erect a garage at row.

ge.—At a recent meeting of the B.G. veyor's estimate for carrying out the of drainage for the parish of East was received. It was resolved that the forwarded to the L.G.B., and that appli- e made for sanction to borrow £600 to t the scheme after the termination of

h.—The T.C. has passed plans submitted R. W. Booth for a motor-house in Clark- ne, and by Messrs. Curry, Ltd., for a Norfolk-street.

—The Carnegie United Kingdom Trust ied the Corporation that the Trustees are to make a grant of £12,000 for the of a suitable library. The following ve been approved by the Streets and s Committee:—Messrs. Brown Bros. & Ltd., shop, Peter-lane; Asiatic Petro- mpany, Ltd., oil tanks, etc., Layerthorpe Mrs. Abbey, combined drainage, 30 and ge-street and 1 and 10, Mill-street; Mr. , redrainage, 3-8, Clark's-terrace, Walm- dcaster Tower Brewery Company, new ing outbuildings, Barrack Tavern, Ful- ; Directors of York Opera House Com- lterations to gallery, Clifford-street; Beckett & Co., temporary motor shed, am-terrace; Messrs. De Burgh Bros., drainage, Albemarle-road.

TRADE NEWS.

the direction of Mr. G. T. Bassett, A., architect, Aberystwyth, Boyle's tent "air-pump" ventilators have lied at the University College of Wales, yth.

ew National Bank, Blackrock, Co. is being supplied with Shorland's Manchester stoves with descending ues by Messrs. E. H. Shorland & Ltd., of Failsworth, Manchester.

derstand that the walls of a Sunday- Pudsey, near Leeds, built about 8 ft. e ground level, became so saturated the dado, floor boards, and joists. lls have since been rendered in Pud- ent, and we hear that, although the has been exceptionally severe, the now perfectly dry.

informed that the Admiralty, after g tests with various classes of , for the purpose of ascertaining the able for the manufacture of naval and seaplane propellers, have d" "Croid" (extra strength "Croid" in its standard strength s commonly employed by cabinet- nd others on account of its being a cold state as well as on account of ty. The makers of "Croid" are oved Liquid Glues Company, Ltd., Hermitage-street, London, E. We ived a sample of "Croid" from the some tests of which bear out the ade for the material. It appears to le for general use and is an easily ted and useful material.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

CX.—No. 3819. APRIL 14, 1916.

HE ARCHITECTURAL EXPRESSION OF OUR TIMES.

THOUGH the battle of styles is now referred to as being dead, controversy as to the best means by which we can express ourselves is as much under discussion as ever, but the field of choice is by common consent more restricted was in the days when Gothic was considered a suitable n for municipal and domestic buildings. We have rd that some phase of the developed Renaissance in he earlier developments are eschewed, but which includes ec work, is suitable for all buildings. Now and then a ke Mr. March Phillipps disturbs our serenity and suggests e are following false lights, and Mr. Pennell considers e are neglecting the real architectural opportunities age because we do not realise the beauties of steel ction, which is the outcome of the engineering sion of the present time. We hope in our next issue to give an article by Mr. Pennell in which he s his point of view and illustrates it by drawings, e trust the challenge laid down will evoke an answer rchitects who consider his views as being heretical and d.

s always possible for the student of any branch of know- o lose sight of fundamental principles which are more s to those whose standpoint is a broader one, and, ch as no great æsthetic development is possible if who practise the arts have not the sympathy of their , it follows that we owe a debt of gratitude to all who eir views clearly before us, whether we regard their views neous or not. The most important point to be decided her outside indifference to art is due to want of education part of the public, or whether it is the result of the y on the part of the exponents of the arts to produce s distinguished by intrinsic merit. We have abundant e that architecture was both understood and iated by the people in mediæval times and continued so till a later date. In the eighteenth century it still ed an appeal to the educated classes, though it had to give joy and delight to all. Now the educated classes ided into a large and a smaller class, the first consisting se who accept buildings as necessities, but feel neither nor interest in them, and a smaller one who represent rvivors of that dignified and cultured class who thought ery gentleman should have some knowledge of archi- . Did the connoisseur of the eighteenth century, who cultured amateur, lead the architect into the quagmire quarianism and kill what he personally prized, and would reek Revival ever have been possible without the nti ?

think that the school of Elmes, Cockerell, Soane, and hitects of the Greek Revival represents an æsthetic which if persisted in would irrevocably alienate all outside thy and feeling for architectural art, however great the dual genius may be who expressed himself through the n of that phase, and we regard the efforts of some of our s of architecture to train students in a similar vogue with misgiving. The story of vigorous indigenous architecture country seems to us to end with Chambers and Gandon, may be that we should even have to go further back for rting-point from which it would be possible to produce ecture which would appeal to and be understood by the for that architecture which can only appeal to the ted must *per se* be an exotic. We may, it is true, be to accept the standpoint that no architecture can have ral appeal to the modern world, because the multiplication of intellectual interests and activities has no place for it in our lives and thoughts.

When we think what the lives of our forefathers were, the way in which they and their families were attached to localities for periods of hundreds of years, and the manner in which callings were followed by the members of the same family from generation to generation, and compare such conditions with those which now obtain, we are inclined to think that the changes which have occurred are the most powerful factor in obliterating interest in the arts.

Its effect on the problem has never received due weight in discussion, for while one section holds the view that the revival of architecture or, as many would prefer to put it, "building" can be brought about only by reverting to the methods of former times in which architecture was the result of the work of craftsmen, others refer us to later periods which were æsthetically great in spite of the decay of craftsmanship. But the diversity of our lives and specialisation force the architect more and more into the position of one who has to rely on his individual judgment in choosing or rejecting his medium, and the result is criticised by those who neither show intelligent or sustained interest nor feel that the arts are really necessary to their lives.

The very able address delivered by Mr. Leask Manson at Leicester, which we referred to last week, has a direct bearing on the question and raises a most difficult problem. The architecture of the past was largely the product of individual craftsmen; the architecture of to-day emanates practically in its entirety from the brain of the architect, while the workers employed in building act mechanically under direction. Can we, without abandoning the use of machinery and improved mechanical methods of production, find a place for the work of intelligent individual craftsmen, giving them some latitude and scope? If we can, the permeation of greater knowledge of æsthetic subjects among the workers must operate as a great revivifying power behind architecture, and will tend to save us from the pedantry of the student steeped in book-learning and dexterously pursuing his aims in spite of surrounding indifference. The period of change of method in working would be a difficult one for the architect, for while we admire Wren's work, which was the result of the combined skill of craftsmen directed by a master who supplied details which would be held totally inadequate now, the most gifted architects of to-day would feel they had done their work insufficiently if they left so much to others as was done two hundred years ago. Yet education in craftsmanship were useless if the architect gives the craftsman no opportunity of exercising his skill and showing his knowledge. To put the question plainly, is the architect willing to take the craftsman into partnership if he proves his capacity?

The problems to be solved seem to us to be, firstly, to determine whether we are working in a medium of style which mankind can be expected to feel interest in as he did in mediæval ages, or whether, as Mr. Pennell would urge, we are neglecting opportunities out of which art should rise as great as that we have admired in the past. If Mr. Pennell is right, we should leave the false gods at whose shrine we have worshipped, and out of the new conditions of life build up great architecture expressing modern life. If Mr. Pennell is wrong in his main contentions we may yet realise that we are in danger of taking the enthusiasm of studious architects too seriously, and may resolve to develop our own national Renaissance instead of straying into the beguiling snares set by the antiquarian and the dilettanti.

NOTES.

Land Taxation. The reply of the Government at the close of the debate in the House of Lords on land valuation can hardly be considered satisfactory. It amounted to this—that a system of taxation which from the very first was proved to be illusory, vexatious to the subject, and a serious cause of actual loss cannot be suspended even for the duration of the war, because it might arouse party feeling, and it was better to let sleeping dogs lie. Viscount Midleton quoted figures showing that in six years the yield of the taxes was £751,068 and the expenditure £3,268,080; but this does not represent the actual case, since this system of taxation involves the individual subject in expense which does not appear in the figures relating to the public expenditure. The war has knocked the whole bottom out of the system of valuation, if it ever had any bottom in it. The recent judgment delivered in the House of Lords in the case of the Attorney-General *v.* Foran again affords a commentary on the machinery under which the Act is enforced. The House held that Form IV. as relating to minerals did not comply with the requirements of the Act and was invalid, and Lord Wrenbury is reported as having said, "I regret that a form issued by a Government Department with a view to enforcing a liability under a taxing statute should assume a shape which I should not be surprised to find in a prospectus issued by a company promoter, but which is not worthy of the source from which the document comes." A taxing statute presumably is passed with the object of bringing in revenue, but the estimates based on this form of taxation have been proved erroneous from the very first, and, although no one at this juncture would wish to raise party strife, it seems extraordinary that any party of politicians can cling to a system of taxation which causes a serious loss in revenue and must continue to do so, especially since the war has upset any basis of value. The war might at least rid the nation of this incubus, which is far more damaging to some industries than any Zeppelin.

Athelhampton, Dorset. In our number of August 7, 1897, we published a plate illustration, from a drawing by Mr. Roland W. Paul, of Athelhampton Hall, near Dorchester, together with some sketches by him of the Hall open timber roof and of the Martin monuments in the neighbouring church of Puddletown. By Mr. A. C. de Lafontaine's direction the Hall—the finest example of Tudor domestic architecture in the county—and the estate of 140 acres will be shortly offered for sale. The name is derived from a traditionary palace of King Athelstan. The Martin family settled there *temp.* Henry III., and were the squires of the parish during 400 years. The Hall is distinguished for its oriel, gallery, oak panelling, old coloured glass, walled and terraced gardens, the ancient dovecot, and the yew hedges. Of the Martins are several monuments and memorials in the chapel of St. Mary Magdalen, being the south transept, or rather aisle, of Puddletown Church. One monument is a decorated altar tomb with an alabaster effigy in armour of about 1400; that of Sir Nicholas Martin records his death in 1595. The chapel appertains to the estate. Puddletown Church is the village church of Mr. Hardy's "Far from the Madding Crowd."

The Deduction of Income Tax from Rent. Some months ago a very eminent legal luminary asserted that the right conferred upon tenants of deducting income tax from rent led to a loss to the Exchequer, as in many cases the amount so deducted was never paid into the Treasury. This statement was questioned at the time, as it was pointed out that under sect. 40 of the Property Act, 1853, the tenant was only entitled to deduct the sum actually paid. This point has now come before the Courts in the case Barnes *v.* Kyffin (the *Times*, March 27). The case is very shortly reported, but it appears that the plaintiff was suing to recover possession of twelve houses and for two quarters' rent on breach of covenant to pay the rent. The defendant had tendered the rent less income tax, which at that time had not been paid, the demand note having not been received until nearly three months after the rent became due. It was contended on behalf of the defendant that the provisions in sect. 40 of the Act of 1853, which made the right to deduction depend upon actual payment, had been repealed by sect. 15 of 27 Vic. c. 18 (1864), which enables a deduction to be made at the several rates in force during the period through which the rent is accruing due. The Court considered the point not even arguable, and only granted relief from forfeiture on payment of the full rent and costs and expenses. We may point out that the provision contained in the Act of 1864 is very important in these days when the rate of income tax is varied during the year, as under the Act of 1853 the deduction could only be made of the rate of tax in force "at the time when" the rent was payable, but it in no way affects the necessity of making payment of the tax before deduction can be made, and tenants should note this point.

Dublin Housing. The Local Government Board (Ireland) has refu
to sanction a housing scheme brought forward
the Dublin Town Council on the ground that
proposed area, which is in Spitalfields, is surroun
by insanitary property which ought to be included, also more provis
should be made for open spaces. A number of members of
Council proceeded to object in a truly Hibernian manner, Alderm
Kelly remarking that the Board were now the dictators to the (
Council, and he thought they had an opportunity of fighting wh
should not be missed. The Council's Law Agent gently remin
the Council that they would be fighting "with hands tied beh
their backs." Alderman Kelly was anxious that the £8,000 wh
it was proposed to spend on the scheme should be made applica
to another estate, but was told that money could not be
on the rates for an indefinite scheme. Alderman Kelly subsequen
drew attention to the disgraceful inequality of rating under wh
Trinity College with the finest site in the city only paid £259 and
Royal College of Surgeons £50, and asked whether such a state
things could not be changed. The Law Agent replied that
revision could only be effected if the law was changed, and he is
report on whether it is possible to obtain a "change in the la
We imagine this is not the first time that Irishmen have wante
change in the law, and we doubt if a Dublin Parliament legisla
for them whether the new *status quo* would satisfy them better th
the present one!

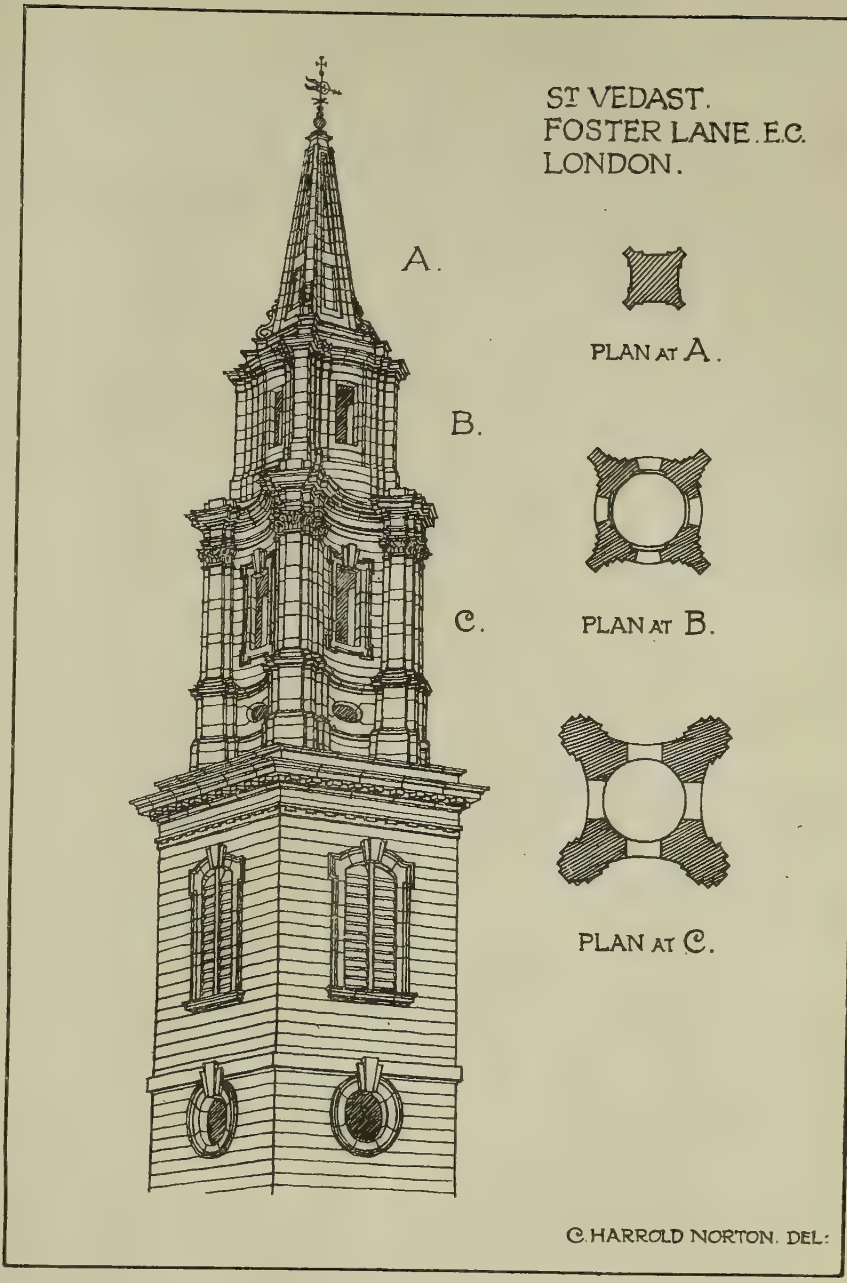
[This is a good example of the work of Mr. Augustus Lukeman who has be
employed to carry out the sculptural adjuncts of several importa
American buildings recently erected.]

HE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. XXVI.—St. Vedast, Foster-Lane.

St. Vedast is said to be dedicated to a hop of Arras who lived in the sixth century, l was formerly known as St. Fausters or sters. It was severely damaged in the Fire, l rebuilt on the old walls by Wren; but the cient steeple was left standing until 1694, en it was pulled down and replaced by what y be regarded as being one of the most fect of all the great architect's designs. no other case has so much effect been ained from alternating stages of concave and vex curves, and Wren's mastery of line and ss is made manifest by the beauty of the nposition. The interior, though very simple, pleasing, the coved ceiling, into which clerestory windows break, being well- portioned, and the arcade between nave l aisle adding a note of interest to an remely simple design. The woodwork is d, and there are a number of interesting and l-designed monuments along the southern l. Both the pulpit and the altar are pleasing, the church as a whole is harmonious and le spoilt by incongruous modern additions ept for some deplorable glass.

ith the parish of St. Vedast are united se of St. Matthew, Friday-street, demolished 1881, and St. Peter, West Cheap, a church ch stood in Wood-street and was not uilt after the Fire. To St. Vedast was also ted the parish of St. Michael le Querne, a rch situated at the east end of Paternoster- , and was not rebuilt after the Fire. St. ast is one of the thirteen "Peculiars" of Archbishop of Canterbury.



No. XXVII.—St. James, Piccadilly.

he church of St. James, Piccadilly, was secrated in 1684, its parish being separated n that of St. Martin-in-the-Fields. It was of the churches in which Wren took most le, and when in 1704 an Act was passed promote the building of further churches utlying London the interior of St. James quoted in Wren's report as an example to followed. The exterior, though dignified simple, is somewhat wanting in interest, is more reminiscent of the earlier Georgian iod than most of Wren's work; the interior listinguished for its good proportions and l-considered detail. It is very similar ts general lines to St. Clement Danes, but, le the chancel lacks the beauty given by the osition of the plan of St. Clement Danes, the il and proportions are more refined and sing. The carving and decoration through- , which are known to be by Grinling Gibbons, show that his work had a quality which his followers never fully succeeded in attaining to. The church is the only one of Wren's erected in the London district outside the limits of the City of London.

THE INSTITUTION OF CIVIL ENGINEERS.

At a meeting of the Institution of Civil Engineers on the 4th inst. a paper on "The Present Conditions of Arterial Drainage in some English Rivers" was read by Mr. Richard F. Grantham, M.Inst.C.E. The subject of the paper was suggested by a reference, in the President's Inaugural Address in November, 1915, to the want of a single controlling authority or conservancy board over rivers whose valleys are liable at times to extensive floods. In 1913 the author and Mr. C. Bidwell were appointed by the Board of Agriculture and Fisheries as Special Commissioners to inquire into and report upon the conditions affecting arterial drainage in certain river valleys on the east side of England, and had opportunities of observing many of the engineering features in the river systems. The rivers examined were—in the East Norfolk district, the Bure, the Yare, and the Waveney; in the Fen and March districts in Cambridgeshire, Norfolk, and South Lincolnshire, the Great Ouse, the Welland, and the Witham; as well as some others in different parts of the country.

SURVEYING, PAST AND PRESENT.

The second Fothergill Lecture by Mr. E. A. Reeves, F.R.A.S., F.R.G.S., was delivered on April 3 at the Royal Society of Arts.

The lecturer gave some interesting details of the Ordnance Survey, in which it is noticeable that the Indian Survey has always kept well ahead of the remainder. The first necessity for maps in Great Britain arose from the requirements of the campaign in Scotland against the Jacobites in 1745, and that led to a proposal for a general survey; but the first base line, which was on Hounslow Heath, was not laid until early in the nineteenth century. The Loch Foyle base was established in 1827, and that on Salisbury Plain in 1848. Speaking of the world generally, until 1860 vast areas in the centres of continents were unmapped; indeed only one-thirtieth of the whole land areas of the globe were then accurately surveyed. Now the proportion was about one-seventh. At that time about one-half of the land had not even been roughly surveyed (as by route traverses), but now the unknown area was only one-seventh. Had there not been important military operations in various places, involving accurate surveys—such as those in Afghanistan in 1884, by Captain Ryder, and in South Africa at various times, and also prospecting surveys for commercial purposes and those made by conscientious missionaries such as Moffat and Livingstone—the unknown areas would have been much greater.

The principal base lines in Europe, Asia, and Africa were shown, including that made by Sir David Gill from the Cape to Egypt. At the International Geodetic Conference in 1909 steps were proposed to connect these base lines with one another. This involves great expense, and would take a long time to achieve, but was thought to be quite feasible. The original maps made by Livingstone in 1855, when he explored the country from Bechuanaland to Angola, and later the Zambesi River, were shown; and also those of Speke, Keith Johnston, and Joseph Thompson.

Of recent achievements, those of Peterkin in 1912, of the Workman Expedition, and of Dr. Filipi, who surveyed from India to Yarkand and Kashgar, and of Clementi from Kashgar to Kowlun, were among the most remarkable. Latterly differences of longitude were obtained by simultaneous observations of time communicated by wireless telegraphy

The difficulties of Polar surveys were described. They are not only climatic but the compass is unreliable, and, as it is only safe to travel by daylight, astronomical observations can only be taken by the sun, which is usually so low that refraction disturbs all the calculations. Allowing for all this, it was remarkable that Capt. Scott's observations of the South Pole only differed from those taken by Capt. Amundsen by half a mile.

An account of the work of the Royal Geographical Society showed that it had lent instruments to 331 expeditions and financially assisted others to the extent of nearly £40,000, and given valuable instruction to 730 surveyors from all parts, and also to special classes sent by the Colonial Office. The Society's Special Survey Diploma had been given so far only to seventy-five students, but the lecturer, who is now responsible for the scheme of instruction, expected great activity after the war in defining new boundaries and opening up many countries hitherto closed to civilisation, and hoped that those fitted for such work would rise to the occasion.

In his third lecture, delivered on the 10th inst., Mr. Reeves described the various instruments used by geographical surveyors. The advent of the telescope, the vernier, and the micrometer theodolite had revolutionised surveying completely; so that now errors were reduced on the average to about 1 in. to a mile, as in the Ordnance Survey absolute accuracy was impossible, as Nature defeated it at every turn—as by the effect of temperature on the instruments, the refraction of light rays by the atmosphere, and even the deflection of the plumb-line from true verticality by unequal gravity. The best that can be done is to try to make the errors balance one another.

Dealing with the theodolite, Mr. Reeves laid down certain essential features—the vertical and horizontal circles should be complete circles, the telescope must be capable of being reversed, and the level must be on the micrometer arm and not on the telescope for all vertical measuring instruments. Heavy instruments cannot be taken on large expeditions, but a good workable 3-in. instrument had been made, and this was used by Shackleton on his Polar work. For measuring lengths tapes made of an alloy of steel and nickel were used. These only gave an error of one in a million for each degree centigrade, as against 1 in 204 with a steel tape.

The tacheometer for rapid measurements was not of much value beyond 600-ft. lengths. The plane table, first brought into general use by Americans, has proved most useful f
topographical work, and a full description of it
use could be found in the *Journal* of the R.G.
for May, 1915. To overcome the effect
damp on the board the paper should be mounte
on aluminium.

For measuring heights a mercurial baromete
was good, but very breakable, and an anero
most unreliable. The clinometer, as improve
by Mr. Reeves himself, gave fairly accura
means for determining heights.

Within proper limits the photo-theodoli
was a very useful instrument, especially i
mountainous country—photographs were take
at each end of the base line and angles re
of the different points.

◆

THE LOCAL GOVERNMEN BOARD'S REPORT O HOUSING AND TOW PLANNING.

We give the following extracts from t
Local Government Board's Report on Housi
and Town Planning for 1914-15:—

"Sect. 54 (2) of the Act of 1909 provid
that we (1) may authorise a local authori
to prepare a town-planning scheme with ref
ence to any land within or in the neighbourho
of their area if the authority satisfy us th
there is a *primâ facie* case for making such
scheme, or (2) may authorise a local authori
to adopt with or without any modificatio
any such scheme proposed by all or any of t
owners of any land with respect to which t
local authority might themselves have be
authorised to prepare a scheme. During t
year ended March 31, 1915, the period

St. Vedast, Foster-Lane. (*See page* 27

hich this Report relates, we gave authority
r the preparation of 49 schemes by the follow-
40 local authorities in respect of areas con-
ining more than 77,000 acres of land,
mely :—

rporations (19) (27 schemes).
Barrow-in-Furness, Birkenhead, Great Yar-
outh, Huddersfield (3 areas), Kingston-upon-
ull, Leeds (2 areas), Lincoln, Manchester
areas), Neath, Nelson, Newcastle-upon-Tyne,
wport (Mon.) (2 areas), Rochdale, Southend-
Sea, Tynemouth, Wallasey (2 areas),
allsend, Wrexham, York.

ban district councils (15) (15 schemes).
Barnet, Beckenham, Edmonton, Esher and
Dittons, Grays Thurrock, Harrow-on-the-
ill, Hendon, Heston and Isleworth, Merton
d Morden, Neston and Parkgate, Oldbury,
ley, Ruislip-Northwood, Sidmouth, Surbiton.

ural district councils (6) (7 schemes).
Doncaster, Halesowen, Hendon, Honiton,
therham (2 areas), Wrexham.

Applications under Consideration.

In addition to the cases above mentioned we
under our consideration at March 31, 1915,
applications by 12 local authorities for
thority to prepare schemes in respect of
as comprising about 25,000 acres of land.

rporations (7) (8 schemes).
Birmingham (8,400 acres), Colne (877 acres),
oydon (812 acres), Mansfield (3,318 acres),
wport (Mon.) (784 acres), Nottingham
15 acres), Southend-on-Sea (two areas of
01 and 62 acres).

ban district councils (4) (4 schemes).
Beckenham (203 acres), Hale (1,010 acres),
ttle Hulton 1,699 acres), Longbenton (2,785
res).

ural district councils (1) (1 scheme).
Wrexham (1,651 acres).

In some of these cases authority to prepare
hemes has been given since March 31, 1915.

ther Cases in which Notice has been Given.

Before an application can be made for
thority to prepare a scheme or to adopt a
heme prepared by owners certain procedure
der the Town-Planning Procedure Regulations
ust be taken, including the giving of notices
persons interested. We had information
owing that in addition to the cases above
entioned preliminary notices had been given
der the Regulations by the following 32
cal authorities with a view to application
ing made to us for authority to prepare
hemes, viz. :—

rporations (13).
Chesterfield, Chorley, Coventry, Derby,
eeds,* Middlesbrough, Ramsgate, Reigate,
lford,* Sheffield,* Shrewsbury, South Shields,*
est Hartlepool.*

rban district councils (16).
Acton, Barnes, Barry, Bentley-with-Arksey,
redbury and Romiley,* Cheadle and Gatley,
iswick, Finchley, Hayes, Hendon, Seaton
elaval,* Southgate, Wembley, Whitley and
onkseaton,* Willesden and Wood Green.

ural district councils (3).
Eastry, Grimsby,* and Warrington.

MINERAL RESOURCES OF GREAT BRITAIN.

The Board of Agriculture and Fisheries
sires to give notice of the publication of
lume 4 of the above named Special Reports,
hich have been prepared by the Director of the
eological Survey in response to numerous
quiries that have arisen through the condi-
ons brought about by the war. Volumes 1, 2,
d 3 are already published, and this, the fourth
the series, deals with the properties, sources,
d uses of fluorspar and gives details of all
orkings in Britain. Price 9d. Copies may
obtained through any bookseller, from
essrs. T. Fisher Unwin, Ltd., 1, Adelphi-
rrace, London, W.C., or from the Director
eneral, Ordnance Survey Office, Southampton.

THE ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the Architects' Benevolent Society was held on the 11th inst. in the rooms of the Royal Institute of British Architects, 9, Conduit-street, W.

The President, Mr. Ernest Newton, A.R.A., occupied the chair, and among those present were Messrs. Lewis Solomon, W. H. White, E. Greenop, O. C. Hills, G. Scamell, C. H. Löhr, Herbert Shepherd, E. C. P. Monson, Percy Tubbs, Andrew T. Taylor, R. Roumieu, Hy. Lovegrove, Hilton Nash, and P. Currey.

The Hon. Secretary (Mr. Percivall Currey) read the annual Report of the Council as follows :—

"The Council of the Architects' Benevolent Society, in submitting their sixty-sixth annual Report, have to state that the past year has been one of great activity. Owing to the war a considerable amount of work has been undertaken, both directly and indirectly, by the Society in connection with the relief of architects in distress.

The Architects' War Committee, which was established soon after the outbreak of hostilities, collected in response to an appeal made by the President funds which they have placed from time to time in the hands of the Architects' Benevolent Society for administration. Since the last Report the Civic Survey Committee, having been successful in their application to the Government Committee on the Prevention and Relief of Distress, the scheme of Civic Surveys for the areas of Greater London, South Lancashire, and South Yorkshire was started in July. Before the end of the year two grants of £1,000 each were made by the Government Committee, and were administered by the Society on behalf of the Civic Surveys for the payment of salaries, etc. Your Council have further worked in close sympathy with the Professional Classes War Relief Council, with the Professional Employment Committee, and the London Society. In consequence of the assistance given by the Government Committee a large number of men have been employed regularly, which has no doubt relieved the Society of burdens it would otherwise have been unable to bear.

The funds placed at the disposal of the Society by the Architects' War Committee have made it possible to deal sympathetically with other applications which have been made in direct consequence of the stoppage of architectural work. . . .

So far as the special work in which your Society is concerned, the relief of pre-war cases and of widows and orphans has been continued. During the year eighty such applications have been responded to, an amount of £701 10s. having been expended in grants. A further amount of £261 has been paid to pensioners of the Society, making the total amount expended in relief in this way £962 10s. Two pensioners have died within the last year, and two other annuitants have been elected and are receiving pensions.

The funds of the Society, notwithstanding the many appeals that have been made in all directions, have been fairly well maintained, the amount received in subscriptions being £636 19s., and in donations and legacies £1,615 3s. 7d. The dividends on investments amounted to £613 12s. 2d. A further sum of £113 1s. was also recovered from the Income Tax authorities. The total receipts of the Society, therefore, apart from the special funds placed at their disposal by other bodies, was £2,968 15s. 9d.

There is a slight diminution in subscriptions, and it is hoped in the coming year that many members who have given donations instead will revert to their former practice. Contributors may be reminded that subscriptions are credited to income, while donations are placed to the capital account, to be subsequently invested in various trust securities.

The capital account was increased £1,000 by the legacy of Mrs. Arthur Cates and by the sum of £343 15s. 1d. from the executors of the late Mr. William Glover's estate, which has now been wound up, and from which there will in course of time accrue to the Society, jointly with the Northern Architectural Association, a considerable sum as residuary legatees. Towards the end of the year the Council were also informed by the executors of the late Mr. C. Bertram Bulmer that the testator had bequeathed a sum of money under certain conditions by which the Society will ultimately benefit. Donations have also been received during the year as follows :—Mr. George Edwards, £25; Mr. Ernest Newton, £10 10s. ; Mr. Arthur Sykes, £10 10s. ; Sir William Emerson, £10 ; Mr. Horace Porter, £10 10s. ; Mr. John Bryce, £10 10s. ; Mr. Archibald M. Dunn, £10 ; Mr. Francis E. P. Edwards, £10 10s. ; Mr. F. B. Dunkerley, £10 10s. ; Mr. Hervey R. Sayer, £10 10s. ; Mrs. Flint Clarkson, £10 10s. ; Mr. R. M. Lucas, £10 10s. ; Mr. W. Campbell Jones, £5 5s. ; Mr. Henry Lovegrove, £5 5s. ; Mr. H. Chatfeild Clarke, £5 5s. ; Mr. W. Hilton Nash, £5 5s. ; Mr. Percivall Currey, £5 5s. ; the Tilers' and Bricklayers' Company, £5 5s. ; Mr. Sydney Perks, £5 5s. ; the Sheffield Society of Architects, £5 5s. ; Messrs. W. and E. Hunt, £5 5s. ; Mr. Guy Dawber, £5 ; Mr. T. R. Bridson, £5 ; Mr. A. Saxon Snell, £5 ; Mr. Henry Beswick, £5 ; and various smaller sums.

To the Special War Fund of the Society the following donations have been contributed :—Mr. E. L. Lutyens, £31 10s. ; Sir Aston Webb, £25 ; Sir Ernest George, £25 ; Mr. W. D. Caröe, £10 10s. ; Mr. Reginald Blomfield, £5 5s.

In the summer of last year an exhibition of paintings, etchings, and drawings was held by members of the Imperial Arts League and members of the Institute. The proceeds, in whole or part, were, at the option of the exhibitors, handed over to the Architects' Benevolent Society's War Fund. The Society thus benefited to the extent of £173 16s. 7d. The Council desire to express their grateful acknowledgment both to the exhibitors and promoters of the exhibition.

During the year purchase has been made out of the capital account of £1,300 War Loan Stock, at a cost of £1,230 1s. 9d. . . .

The Council have to announce with great regret the death of their senior Vice-President, Mr. H. L. Florence, and Mr. J. Macvicar Anderson, one of the Trustees and at various times a member of the Council. They also regret to announce the death of Mr. C. Bertram Bulmer.

The following, being the five senior members, retire by rotation from the Council : — Mr. Henry Lovegrove, Mr. William Grellier, Mr. C. R. Baker King, Mr. Andrew T. Taylor, Mr. W. D. Caröe. To fill the vacancies caused by these retirements the Council have the pleasure to nominate Sir John J. Burnet, Mr. William Woodward, Mr. Arthur Ashbridge, Mr. A. Saxon Snell, and Mr. Lewis Solomon." . . .

The President, in moving the adoption of the Report, said on account of the war a very great strain is put on the funds collected for meeting cases, and they are very numerous, of those who have suddenly found themselves with very little income in the present.

The motion was adopted.

The Council for the session 1916-17 were elected as follows :—

President—The President R.I.B.A., Mr. Ernest Newton, A.R.A.

Vice-President—Mr. R. St. Aubyn Roumieu.

Ordinary Members—Messrs. Basil Champneys, C. Stanley Peach, W. Campbell Jones, Percy B. Tubbs, Edward Greenop, Lewis Solomon, Arthur Ashbridge, H. Chatfeild Clarke, Horace Porter, Walter L. Spiers, W. Henry White, Sir John J. Burnet, A. Saxon Snell, Wm. Woodward, E. C. P. Monson.

On the motion of Mr. Roumieu, seconded by Mr. Greenop, Mr. Hilton Nash was thanked for his past services and re-elected as Hon. Treasurer. Mr. Scamell moved a vote of thanks to Mr. Percivall Currey and his re-election as Hon. Secretary.

On the motion of Mr. Percy Tubbs, seconded by Mr. Hilton Nash, Mr. Herbert Shepherd and Mr. Osborn C. Hills were thanked for their past services and re-elected as auditors for the ensuing year.

---

* In these cases applications had at beginning of
ptember, 1915, been made for authority to prepare
emes.

GENERAL NEWS.

Good Friday Week.

In consequence of the Easter holidays we go to press a day earlier than usual next week, the *Builder* being published on Thursday. All communications must reach the Editor by first post on Tuesday morning.

The People's Housing.

The Nottingham and District Property Owners' and Ratepayers' Association, Burton Buildings, Parliament-street, Nottingham, have sent us a pamphlet entitled "The People's Housing," dealing with the effect of the Finance (1909-10) Act, 1910, on the building of cottages, by Mr. A. W. Shelton, F.A.I.

The Late Mr. Harry Hems.

Mr. Harry Hems, of Fairpark, Longbrook-street, Exeter, ecclesiastical art worker, who died January 5, left estate valued at £13,027 gross, with net personalty £10,083. In his will he expressed the desire:—"That the 'Chicago' rood beam shall be placed in the chancel of St. Sidwell's Church, and the following inscription placed thereon:—'This Chicago beam was made by Harry Hems, sculptor, of this parish, who lived and flourished here, 1869-19—, and died ————, having received the highest attainable honours awarded at the World's Fair, Chicago, 1893, and the gold medal at the International Exhibition, Antwerp, the following year for the work.'"

The Architectural Association.

An ordinary general meeting of the Architectural Association was held at No. 37, Great Smith-street, Westminister, S.W., on Monday, April 3, Mr. H. Austen Hall (President) in the chair. The President proposed that a vote of condolence be passed to the relatives of the following members, who had fallen in the war since the last meeting of the Association:—Messrs. H. E. J. Davidge, Maurice Day, and Henry Wood. The motion was carried in silence.—Two nominations were announced, and the following gentleman elected a member—Mr. C. J. Kennedy, 49a, Longridge-road, Earl's Court, S.W. The following reinstatement was announced:—Mr. A. K. Chaudhuri, 118, Elgin-crescent, Holland Park, W.—The President read the Council's nominations for the House List for the ensuing session, and stated that formal nominations would take place at the next ordinary general meeting, which would be held on May 1, when it would be competent for any two members to nominate further candidates.—It was announced that the late Mr. H. L. Florence had bequeathed to the Architectural Association the sum of £1,000 for the purposes of the Association and a further £1,000 to found and provide an annual prize to be described by or associated with Mr. Florence's name.

London 43 V.A.D. (Architectural Association).

A section of this detachment (which is composed very largely of architects), under the command of Commandant A. W. Coffin, provided two fully-equipped stretcher squads at the Michie Hospital, Queen's Gate, on March 15, on the occasion of the opening of that Institution by H.M. Queen Alexandra. During the afternoon Lord Reading inspected the hospital, and spoke in appreciative terms of the services which are being rendered throughout the country by the V.A.D.'s working under the British Red Cross Society. Members of the detachment afterwards had an opportunity of inspecting the hospital, which is fitted with the latest appliances in the way of baths, etc. Those members of the stretcher squads who are architects were in particular able to appreciate the successful manner in which the hon. architect to the hospital, Quartermaster Victor Wilkins, M.S.A., had overcome the difficulties incidental to adapting a mansion of this description for the purposes for which it was never originally intended, viz., the reception and treatment of something like fifty wounded soldiers. With the opening of the Michie Hospital, the Architects V.A.D. will be, in addition to its other duties, providing orderlies for five V.A.D. Hospitals in the Westminster Division.

Building Materials and Furnishings, Australia.

A manufacturer and importer in Sydney desires to get into touch with United Kingdom manufacturers of building materials and furnishings. Communications in this connection should be addressed to the Official Secretary, Office of the High Commissioner in London for Australia, 72, Victoria-street, S.W.

Water-Colours at Manchester.

With the object of helping artists at the present time the Governors of the Whitworth Institute, Manchester, have opened an exhibition of water-colours by living artists to take the place of that abandoned by the Manchester City Art Gallery. It will remain open for seven weeks.

Memorial to the Late Lord Londonderry.

The memorial to the late Marquess of Londonderry subscribed for by the parishioners of Seaham Harbour is to be unveiled on April 15 in St. John's Church. The memorial is a tablet of white Carrara marble, with a carved foliated border inlaid with Sienna marble. It is surrounded by a moulded frame of polished Irish green marble, and surmounted by the coat of arms of the late Peer emblazoned in heraldic colours. It has been executed from the design of Mr. W. H. Wood, of Newcastle and Durham, by Messrs. Gaffin, London.

Progress at Letchworth.

From the annual Report, 1915, of the Garden Cities and Town-Planning Association we take the following:—It is satisfactory to record that the year has marked continuous advance at Letchworth, an increase of over 2,000 inhabitants being recorded in the last Report of First Garden City, Ltd. A large number of these are dependent upon a new Belgian firm of motor-car manufacturers who were previously in business at Antwerp. The present population is now estimated at 12,000 people. The satisfactory condition of the estate is evidenced by the increasing improvement of the financial condition, the net profit for the year being £5,822.

Rebuilding Belgium.

In their annual Report for 1915 the Garden Cities and Town-Planning Association (No. 3, Gray's Inn-place, W.C.) reports that the International Garden Cities and Town-Planning Association has effected a great deal of useful work, particularly in regard to Belgium. In conjunction with the Garden Cities and Town-Planning Association and with the approval of the British Government and the Belgian Government a Conference of Belgian architects was held at the Guildhall of London in February, 1915, for the purpose of studying the question of the rebuilding of Belgium on garden city and town-planning lines at the end of the war. Proceedings, which were wholly in French, were followed by some three hundred Belgian professional men, and representatives were also present from the various professional bodies in this country, from the architectural societies in Holland and France, and also from the French Housing and Credit Societies. Resolutions were unanimously passed, including the following:—

The Conference is in agreement with the general principles of the Garden Cities and Town-Planning Association, and purposes—

That a general plan of Belgium be drawn up, including

(*a*) A plan of the roads, railways, and canals;
(*b*) A plan of the towns partially destroyed;
(*c*) A plan of the towns and villages entirely destroyed.

That the application of the existing laws and the form of the laws to be eventually introduced should be such as to constitute a compulsory minimum standard, and that these laws should be so elastic as to be adaptable to the æsthetic and hygienic necessities as they may be clearly defined.

Any reconstruction whatever of the whole or part of a town which has been destroyed should be preceded by the drawing of a plan of lay-out, of extension and of improvement, which should determine the arrangement and the disposition of the different quarters, should fix the direction and width of the streets, the situation and the area of the squares, public gardens, parks, etc.

British Industries Fair, 1916.

The Board of Trade have now decided to hol the British Industries Fair in London next yea from Monday, February 26, to Friday, March inclusive. Full particulars regarding the Fa and the building in which it is to be held wi be announced in due course.

War Hospital.

Bath War Hospital, at Combe-park, wit the Lansdowne Cricket Club ground for recrea tion, is now open for patients. The hospit has been built and equipped by the War Offi from the designs of Mr. H. B. Measure F.R.I.B.A., Director of Barrack Constructio

Nottingham.

We have received a copy of an interestin publication entitled "The City of Nottingha —Past, Present, and Future," officially issu by the Corporation. The book deals wi this city's special advantages as a commerci centre and as a place of residence, and contai several useful maps and illustrations.

Crystal Palace Engineering Society.

The "Wilson Premium" for the best pap read before this Society (affiliated to the Socie of Engineers) during the present session h been awarded to H. M. Wilson for his pap on "Concrete." Other papers read before t Society were "Petrol Engines," by W. Wemyss, and "Railway Bridges and th Constructional Details," by C. L. C. Brock. T premium was presented to Mr. Wilson by Mr. Patten Barber, M.Inst.C.E., Past-Preside of the Society of Engineers, and of the Ins tution of Municipal and County Engineers, the 130th Distribution of Certificates at t above school, at which he presided on April 6.

The War Damage Committee

At the general meeting of the War Dama Committee, held in the Guildhall, London, the 13th inst., over 300 municipal authorit were represented. The object of the Committ is to urge the Government to abandon th Scheme of War Damage Insurance, and pr vide out of National Funds for compensati to those who suffer damage from the attac of the enemy. A memorial to this end is be presented to the Prime Minister, but t Committee feel that they should not prese their case to the Government until they are i position to prove beyond fear of contradicti that they have the support of the count In a recent circular they say:—"We thi there can be no better way of demonstrati what the opinion of the country is than ascertain the views of the municipal authorit and other corporate bodies in every part of United Kingdom."

The Wonder of Work.

Harper's Magazine for March contains so specially interesting articles, including one Mr. Joseph Pennell on "The Wonder of W in the North-West," illustrated by ei characteristic drawings in tint by the auth who says:—"Art follows commerce. T profits from commerce in the past were used build temples and shrines to the glory of patr saints and for the saving of souls. To-day profits from commerce are devoted to the bui ing of something bigger than ever has be built. No longer is the Church the great patr of art. Artists to-day do not seek commissi from popes and princes, but from captains industry and politicians. While in other da popes and princes built churches and pala which are still the wonder of the world, to-d Commerce and Industry are doing work equa impressive. Our modern mills and docks a canals and bridges are even more wonder They are our triumphs of art, and yet har anyone records their building. We are familiar with these masterpieces before eyes that we pay no attention to them. make few if any records of our greatest mo ments, our greatest triumphs in engineer and architecture which are far more amaz than the work of the past, and quite as w worth recording. The mills and docks a canals and bridges of the present are m mighty, more pictorial, and more practical th any similar works of the past; they are the t temples of the present. Our mills are as w worth painting as mediæval churches."

HADWICK PUBLIC LECTURES:

MILITARY EMERGENCY HOSPITAL CONSTRUCTION.

At the Royal Sanitary Institute, 90, Bucking- m Palace-road, S.W., on Thursday, April 6, Maurice Fitzmaurice, C.M.G., Chairman, esiding, Mr. A. Saxon Snell, F.R.I.B.A., R.San.I., delivered a lecture on "Emergency ilitary Hospital Construction." The lecture s illustrated throughout with a most interest- g series of plans and views of military hospitals England and abroad. In the course of his marks the lecturer said:—

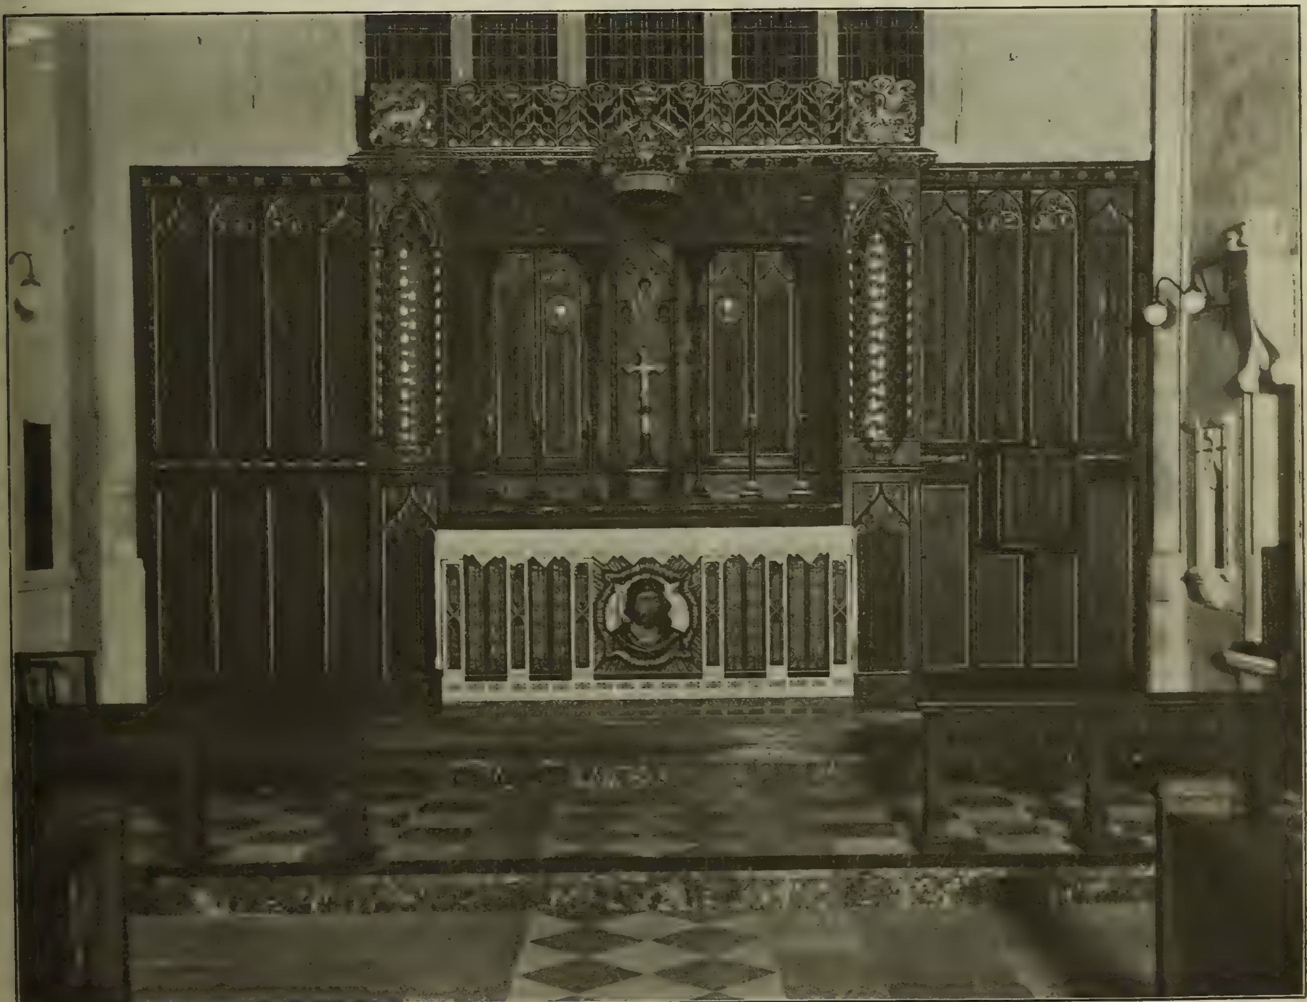
"To meet the emergency of war, the War fice has always reckoned upon making use spare accommodation in voluntary and blic hospitals and infirmaries; and, of course, its own service hospitals. In addition to ese arrangements have been made for quisitioning a large number of public buildings, hools, etc., for conversion as temporary spitals. Other countries have made similar rangements, and it is quite in accord with eir policy of thoroughness that the Germans ve in many of their public schools made ecial arrangements for converting them into spitals. In addition to the conversion of isting buildings, the War Office has also ntemplated the erection of temporary emer- ncy hospitals, for which purpose detailed ans have long since been prepared; such ildings could be erected at short notice, very ickly, and at small cost.

The scale of the present war is so large that any civil architects have been called in to sist the War Office in carrying out temporary spital schemes. It was inevitable, however, at many of the plans show considerable riation from the War Office model, both as gards planning and construction; although, of course, in every case such plans had to be submitted to and approved by the War Office. The variation in planning is instructive and interesting.

One of the first of these hospitals was the 1st Eastern Hospital at Cambridge, which is remarkable for being designed upon the open-air principle. It represents an act of faith and courage on the part of those who initiated it, amongst whom I may mention Professor (now Colonel) G. Sims Woodhead, and Colonel Griffiths, the Officer Commanding. It was designed and carried out by Mr. Charles Skipper, of Cambridge. Open-air wards for use both in winter and summer are by no means new in this country. For instance, Dr. Philip Boobbyer, Medical Officer of Health at Nottingham, has had several in his district for a number of years. In these every kind of disease has been treated (not excluding pneumonia) winter and summer. The value of roughly improvised buildings and sheds, which are practically open-air, is referred to by Miss Nightingale, Dr. Brocklesby, Sir John Pringle, and as far back as 1758 by Dr. Guy. The nucleus of these temporary hospitals is generally an existing hospital or a house, the permanent buildings of which are of considerable value as administrative offices or staff quarters.

Methods of construction vary. The War Office model plans provide for a framing of timber, lined on the inside with plaster slabs and on the outside with corrugated iron; roofs are also finished with corrugated iron. Timber framing lined inside and out with asbestos sheets is another method of construction, and these buildings are more sightly and no less fire-resisting. Ruberoid is used on the roofs. The flooring is of tongued boards and wood joists. At Leicester the walls are of brick, and the floors cement. At Shorncliffe Mr. White has covered his floors with linoleum, than which there is no more satisfactory ward floor. Heating in closed wards is generally by means of steam pipes and radiators. At Shorncliffe anthracite stoves are used. In open-air wards no heating whatever is provided. Nevertheless, a few open fires are desirable, and in the later buildings at Leicester Mr. Perkins Pick has provided one at the end of each ward in a partly enclosed day room. They are appreciated for the appearance of comfort, and they provide also for the nurses some means of warming their hands previous to changing dressings, etc. Electric lighting is general throughout.

In these buildings it is not usual to observe any meticulous care in the rounding of internal angles and in the avoidance of dust-ledges. Even the sinks and lavatories are generally supported on rough wood frames. The buildings are, of course, meant to be temporary, built quickly, and at very small cost, and these matters are incompatible with refinement in detail. Nevertheless, these refinements cannot safely be, and are not, ignored for isolation hospitals and in operating theatres. One matter—and it can scarcely be called a refinement—is rather generally ignored, *i.e.* a layer of concrete over the whole surface of the ground of the building. It may be of less importance if the building is raised a few feet above the ground, so as to provide a clear sweep for the air, otherwise, especially in enclosed wards, ground air is bound to find its way upwards, and the quality of ground air is variable and not to be ignored with impunity. The cost of these buildings varies greatly. The War Office model plan is estimated between £60 and £70 per bed, but the Cambridge, Canadian, and Glasgow Hospitals were about £25 per bed. At Leicester the ward blocks only cost £15 10s. per bed."



Altar and Reredos, St. Mary the Virgin, Laira, Plymouth.

ILLUSTRATIONS.

St. Mary the Virgin, Laira, Plymouth.

THE walls are built of Dartmoor granite of varying tones of yellow and brown, blending well with the sandstone dressings. The church is not completed for want of funds.

The altar and reredos are in oak—the "Mensa" being of one slab of "dove marble." The altar is wholly painted and gilded, and the reredos and side panelling "picked out" in colour and gold.

Much of the moulded work—the main roll members—are chequered in gold, but there is no sign of it in the photograph, and a dark blue background to the cross niche makes the coving appear as a flat panel.

The band of vine foliage and fruit is treated in a realistic manner, springing from stems which spread out at the branches after the manner of fan vaulting. T. R. KITSELL.

Chancel of St. James the Less, Plymouth.

THIS illustration shows the new organ loft and vestry screen in oak; the new hanging rood in oak; the new dwarf alabaster chancel screen and wrought-iron gates, and pulpits (ambone), also in alabaster.

The whole chancel has been changed in character by cutting away the lower portion of the original pitch-pine roof principals and the stone corbels, substituting an oak barrel vault with ribs, with carvings at intersections, etc. The walls have been decorated in colour, the lower portion panelled in oak.

New altar and reredos and server's recess, oakstalls, etc., in place of the pitch-pine chancel fittings and the glazed tile dado. The various changes have been made not as a whole scheme, but from time to time during the last few years.

Parish Hall, New Brighton, Cheshire.

THIS is a pleasing and characteristic example of Mr. Guy Dawber's work.

Training College, Wellington, New Zealand.

THIS building has been erected in Wellington from the designs of Mr. W. Gray Young, of Wellington. The building was one of a group of three for which a competition was held, and Mr. Young's designs were awarded first premium.

Owing to the limited nature of the site the Training College had to be erected right up to the street frontage. The building contains two lecture-rooms, art-room, library, men and women's studies and common-room, geographical and chemical laboratories, museum, principal's office, and the usual sanitary arrangements. The exterior is finished in lime-washed rough cast and pressed brickwork.

Wren's Churches.

WE give illustrations of the tower of St. James, Piccadilly, from a drawing by Mr. Harrold Norton, and some excellent measured drawings of St. Benet, Paul's Wharf, which we dealt with in last week's issue, and which is one of the most interesting of Wren's smaller churches.

OBITUARY.

Sir Colin Scott-Moncrieff, K.C.S.I.

The death, on April 6, is announced of Sir Colin Campbell Scott-Moncrieff, K.C.M.G., LL.D. (Edinburgh), aged eighty years. He was the sixth son of Robert Scott-Moncrieff, of Fossaway, and was educated at Edinburgh Academy and the H.E.I.C. Military College, Addiscombe, whence he passed out into the Bengal Engineers in 1856. He was employed in the Irrigation Department of the N.W. Provinces and as Chief Engineer, Burma. Having retired, with the rank of colonel, in 1883, he was appointed Under-Secretary of State Public Works, Cairo, with charge of the Irrigation Department. In 1890 his grea engineering work—the restoration of the Nil burrage—was brought to a successful end He left Egypt in 1892, and was then appointe Under-Secretary for Scotland, an office he hel for ten years. In 1902-3 he was President, i India, of the Indian Irrigation Committe Sir Colin Scott-Moncrieff was the author o "Irrigation in Southern Europe," 1868.

Lieutenant A. T. Hardman.

Lieutenant Adrian T. Hardman, of th Royal Fusiliers, died on March 30 of wound received in France, aged twenty-five years He was the only son of Mr. T. Hardman, o Northaw, Potters Bar. On leaving Christ' Hospital he became a student Architectura Association, and gained a fourth year travelling studentship; he passed the Intermediat Examination of the Institute. He was article to Mr. F. R. Farrow, F.R.I.B.A., and was pupil of Sir Ernest George, A.R.A., & Yeates At the outbreak of the war he, when he wa studying in Paris for the École des Beaux-Art joined the Inns of Court O.T.C., and obtaine a commission in the Royal Fusiliers (Specia Reserve) in February of last year, and wa appointed bomb-instructor.

Mr. L. Ower.

The death has occurred of Mr. Leslie Ower familiar in business circles in Dundee as th senior partner of the firm of Messrs. Lesli Ower & Allan, architects and civil engineers Whitehall-street.

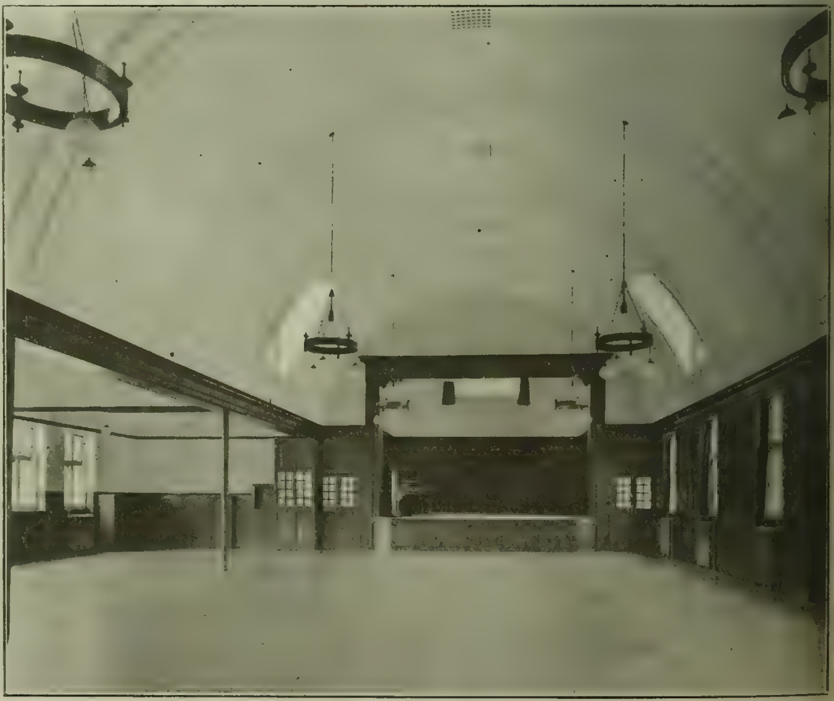
◆

FIFTY YEARS AGO.

State of St. Paul's, Deptford.

AN inhabitant writes:—"I have th pleasure of reading your excellent publicatio once a week, and cannot but admire you strictures and remarks on sanitary matters If you would take a walk to Deptford High street, and turn to the left, down Hamilton street (in particular), as well as Hyde-street you would find the lower end (of the first named street) one sheet of water, which ha no means of discharging itself; so it soak into the earth, year after year, and mus ultimately evolve miasma, which some day or other will exhibit itself in an outbreak o fever or sickness amongst the inhabitants."

[*** From the *Builder* of April 14 1866.—ED.]



Parish Hall, New Brighton, Cheshire.

Mr. E. Guy Dawber, F.R.I.B.A., Architect.

CIVIC DESIGN SECTION.

COMPULSORY TOWN PLANNING.

MR. H. R. ALDRIDGE recently read a paper on the subject of "Compulsory Town Planning" at a general meet- of the Town Planning Institute, in which discusses the town-planning proposals in e "Urban Land Report," which states at, while improvement has taken place ently, "over the vast majority of urban eas the development of building estates ntinues on the old unsatisfactory lines." e conclusion has been reached that it is acticable to extend the benefits of town anning and to render uncontrolled develop-ent impossible. The means suggested are at every local authority should be compelled prepare a scheme for the development of unbuilt-on area within a specified time, at the maximum number of dwelling-houses ould be fixed, and building lines should be opted along existing roads which will render eir widening to meet future traffic require-ents practicable. The Local Government oard should see that certain minimum require-ents were satisfied, and if a local authority d not prepare a scheme within the given riod the Local Government Board should be powered both to prepare and enforce a heme of its own. Mr. Raymond Unwin oints out that the adoption of the Committee's oposals need not necessitate an increase the cost of road and sewers per house, but at if landowners adopted the new methods development the garden attached to each ouse could be quadrupled for a very small crease in rent. Mr. Aldridge differentiates tween the value of the various municipal rvices, which he divides into three classes :—rst, those relating to health and safety, such sanitary and health departments, water, nd the police ; secondly, those which add to e efficiency of the industrial units of the mmunity, such as gas, electricity, and means transit ; and, thirdly, those which add to e comfort and amenity of the community connection with such objects as libraries, rks, and playgrounds, and means of transit r purposes of pleasure or recreation, and he gues for town-planning control as a means producing the greater health and safety of e community, its industrial efficiency, and s pleasantness.

The objections raised to compulsion are, he ints out, firstly, that the State has not the wer to force local authorities to perform these sks; and, secondly, assuming that it is done, ils may be intensified instead of being ssened.

Experience has shown that very clear lvantages have been gained where town-lanning schemes have been adopted, as in e Hampstead Garden Suburb as compared ith Tottenham, new Edinburgh as compared ith the old town, and numerous other cases.

The arguments against the proposition are ated by Mr. Aldridge as being, first, that town lanning should not be made obligatory until ore experience has been gained with regard the standards to be adopted in the prepara-on of schemes ; secondly, that a sufficiently rge number of skilled town-planners are not vailable ; and, thirdly, that it is best for local thorities to learn the advantages of town lanning gradually, as they have done with her adoptive powers.

These objections are answered by the fact hat six years of experience under the Housing nd Town Planning Act are available, that oor planning is better than none at all. As the third objection, it is pointed out that in e case of gas, water, and other services there as always been the inducement that they could e made directly remunerative, which does not ply to town planning any more than it does education ; and Mr. Aldridge asks very pertinently what educational work would have been undertaken if it had not been obligatory.

We consider a very good case has been made out for the adoption of some system of compulsion with regard to the preparation of schemes, always providing that some accurate data as to the probable increase of population in a given area is available. That is to say, that in a slow-growing or stationary district harm might be done by the preparation of a scheme the ultimate economy of which would depend on its complete development, for there are everywhere visionaries who see before them future towns in cornfields, and we foresee a possibility of an ambitious local authority preparing schemes much in excess of the legitimate or probable growth of districts. Birkenhead was laid out in the expectation that it would rival Liverpool in size and as a shipping port, and for years it had miles of streets laid out without the buildings which would have justified their existence. We believe that after the war it might be as well if the Local Government Board prepared a survey of the urban and rural districts of the country, considering them with relation to manufacturing and other problems, and then, having made up its mind that the growth of population would be great in certain areas, made it compulsory on the authorities within those areas to prepare schemes and submit them for approval.

Another point needs emphasis, which is that the provision of proper housing facilities in every district will after the war be an even more difficult question, as far as finance is concerned, than it has ever been before. It is therefore necessary that full advantage should be taken of private speculation. Experience shows that private enterprise in building is less costly than municipal or State directed enterprise, which should in the interests of economy only be considered as a last resort. If a municipality builds 500 houses it requires a large staff of supervisors, and labour, using its power on local bodies, sometimes extorts conditions which would not be conceded by the private speculator. If twenty-five builders can be induced to build twenty houses each, the community reaps the advantage of individual enterprise, nor is it handicapped by the risks incidental to the exercise of executive functions. But if we are to have private enterprise we must see that the building speculator is not harassed and handicapped by legislative enactments, making it possible to take away his profits while refusing to share his losses. As far as actual building is concerned, we entirely agree that town-planning schemes should be made compulsory wherever the growth of population makes their adoption advisable, but we must not assume that the industrial development of the country will necessarily be enormous after the war. It should be if our Government and people act wisely ; but the golden fruit will not fall into our laps without much striving, nor can we in this country look forward to the freedom from competition which was our lot in the first half of the nineteenth century. Commercial prosperity depends on the scientific utilisation of our natural advantages, on education, work, and the avoidance of those periodic outbreaks of industrial unrest which have been so common in this country during the last fifty years. Labour has to learn that the restriction of output is bad policy for the employed as well as disastrous to the employer, and that the main object is to increase trade, profits first and then to discuss their fair apportionment between capital and labour afterwards. Building activity is the outcome of trade prosperity, but cannot produce it, and the betterment of housing must be financially a good proposition or it will never be undertaken on a large scale. The nation can only progress if it learns the lesson of war—"United we stand, divided we fall"; every advantage thrown away by the individual damages the community, and we have rivals in other countries only too eager to make profit by our weakness and folly. We think, in brief, that extensive town planning is a necessary corollary of vigorous natural development, but will remain a dead letter if the nation is decadent or divided by industrial faction.

NATIONAL HOUSING AND TOWN PLANNING CONGRESS:

Home Problems After the War.

CAXTON HALL, Westminster, was filled on Tuesday at the opening of the National Congress promoted by the National Housing and Town-Planning Council to consider home problems after the war. Councillor Harold Shawcross (Chairman of the Council) formally opened the Congress, and said they had representatives present of the local authorities, the architectural profession, the building trade, both employers and employed, and a large number of societies interested in the subject. He claimed that the conferences promoted by the Council had always struck a note of practicability. They had always endeavoured to have some kind of remedy to meet any difficulty which arose. What they wanted to be assured of was that there would be capital available for housing after the war, and, as the only people who could raise money was the Government, they would ask them what their intentions in the matter were. They did not want to muddle through with the matter as they had muddled through with so many other matters in the past. The best brains in the country were now available for designing houses and laying out estates, because architects were now almost without work at all. Many of them were taking up the question and making civic surveys of different parts of the country, and he did feel that these brilliant brains which were now lying fallow could be set to work trying to elucidate the question of the best design of cottages for different districts, and in the preparation of plans which could be available for local authorities. He was sure many architects would be only too glad to be busy on problems of that sort.

Mr. H. R. Aldridge (Secretary) having explained the procedure of the Congress,

Mr. B. S. Rowntree (York) pointed out that millions of men from the Army and the munition factories would be demobilised at the end of the war. It was for the Government to see that these men were not unemployed, and if there was unemployment it would be their own fault. They were concerned at that Congress with the building trade, which would be in a state of great dislocation. With the spirit of uncertainty which would prevail the ordinary investor would not select bricks and mortar for his investment. Therefore unless they took steps in advance the building trade was likely to be hardly hit during the period of dislocation. Another reason for taking early steps to develop a vigorous policy of building directly the war stopped was that there was now a house famine in the country.

Councillor S. Smethurst (Past-President of the National Federation of Building Trades Employers) said it had been a painful thing to him that the most important section of building trade employers had neglected the building of houses, with the result that much of the house building in the large urban districts had fallen into the hands of a class of persons who had not produced good healthy houses. It might cost 20 per cent. more to build a house well, but in the end it was more economical. He trusted in the future, civic authorities would see that houses were built by men whose reputation would be a guarantee of quality.

Mr. A. G. Cameron (Amalgamated Union of Carpenters and Joiners) contended that private enterprise had failed to meet housing needs, and the State must step in.

Housing Schemes After the War.

The Congress proceeded to consider a paper by Councillor H. Shawcross on "The Preparation of Housing Schemes to be Placed in Operation at the Close of the War." He pointed out the virtual stoppage of the building of working-class houses since the outbreak of the war, which was due in some measure to the refusal of the Government to lend money to the local authorities and public utility societies for the purpose. He considered it would be necessary, at any rate in the months directly succeeding the close of the war, to rely primarily on local authorities to remedy the shortage of houses. He moved:—"That this Congress urges the Government to re-enact the Housing No. 2 Act (1914) to be placed in operation at the close of the war and to increase the amount provided under the Act to £20,000,000."

Answering a question, the Chairman said the £20,000,000 asked for would be the capital sum for building houses, and they reckoned it would provide 100,000 houses.

Councillor Coyle (Mid-Lanark) moved an amendment to the effect that the Government should be urged to make such advances to local authorities as would enable them to provide houses at reasonable rentals having regard to all necessary and equitable circumstances and conditions.

Mr. Wiseman (Workmen's National Housing Council) proposed as a further amendment that the Government be urged to set aside the sum of not less than £20,000,000 to be placed at the disposal of local authorities for housing purposes after the war.

It was decided to refer all amendments to the Standing Orders Committee.

Mr. Hill (Workmen's National Housing Council) urged that the working classes ought not to have houses unpleasant from the architectural point of view foisted on them. They did not want long rows of concrete houses.

Mr. Cheverton-Brown (Chairman of the National Federation of Property Owners) considered neither the resolution nor the amendments were practical means of dealing with the subject. It was wrong to talk of private enterprise having failed, seeing that 98 per cent. of the houses for the working classes were erected by private enterprise. He proceeded to move a resolution to the effect that all national legislation hampering the provision of housing for the people should be repealed or amended in order to restore public confidence, encourage private enterprise, and resuscitate building operations.

The Chairman ruled the amendment out of order.

At the commencement of the afternoon session other amendments were proposed which were referred to the Standing Orders Committee, and it was decided to take a vote on the following morning.

Amendment of Finance Act.

The next subject for discussion was that of general housing finance at the close of the war, and especially the need for removing legislative difficulties which hamper developments in the building trade; the possibility of amending the law in regard to the compounding of rates, etc.

Mr. A. W. Shelton (Nottingham) moved:—"That this Congress is of opinion that the legislation promised by his Majesty's Government in 1913 and again in 1914 with regard to the amendment of the Finance Act of 1909 should be now carried out in order that an admitted obstacle to the building of working-class houses may be removed and the provision of such houses stimulated at the close of the war." He considered that at the termination of the war there would be a shortage of 600,000 houses. It was no good leading people to believe they would get houses at less than their economic value, and he made the strong plea that, whatever was done by the State or the local authorities, it ought to be made possible for the men who had built 90 to 98 per cent. of the working-class houses in the past to continue their work in the future.

Mr. S. Smethurst (National Federation of Building Trades Employers) seconded the motion, and remarked that the Finance Act had had the opposite effect to what Mr. Lloyd George intended.

Mr. Cheverton-Brown expressed the opinion that the Act was so bad that it would be better to repeal it altogether.

A lengthy discussion followed which had little relation to the resolution before the meeting. Nearly every speaker dealt with the question of State and municipal *v.* private enterprise, and at times the proceedings were a little heated. The resolution was eventually carried. (*To be continued.*)

THE SURVEYORS' INSTITUTION: TOWN PLANNING.

An ordinary general meeting of the Surveyors' Institution was held on Monday at No. 12, Great George-street, Westminster, S.W., Mr. Sabin in the chair.

The minutes of the previous meeting were read and confirmed. It was announced that twenty-three publications had been presented to the Library in addition to eight donations of 2 guineas each. It was agreed that the thanks of the Institution be conveyed to the donors.

Mr. W. R. Davidge (Fellow) then read a paper entitled "The Principles and Position of Town Planning," in the course of which he said:—

"Before entering upon the discussion of accepted town-planning principles, it is well to realise that the term "town planning," embracing all communities large and small, is a very English one. In the United States and Canada the universal description of the same thing is "city planning," which seems at first even more inappropriate, until it is remembered that in America a community may be a "city" even if it has only 500 people in it.

With us the cities of London and Westminster and our other cathedral cities are of so ancient a foundation that it gives us somewhat of a shock to find that many of our Colonial towns have springing up around them scores of such "cities." Melbourne, for instance, is surrounded with numerous growing suburbs, nearly a dozen of which are dignified by the name of "city." So general has the practice become that, by special enactment of the State Government, it is now possible to adopt the name of "city" as soon as the population reaches 20,000. The term "town planning," however, fairly correctly describes the methods so far adopted in England, as contrasted with the expression "town building" ("*stadtebau*" or "*construction des villes*") prevalent on the Continent. In this country, under the Act, our effort is principally directed to planning the land around our towns, and so far the architectural or "town building" side has hardly been touched. This variation in nomenclature expresses in another form the varying ideals and national characteristics of "town planning" or "city planning" as understood in the various countries of the world. It is well that this divergence of national outlook should be appreciated before we proceed to discuss "accepted principles, by whom accepted, where and why accepted." There has in the last six years been an amazing wealth of literature and such a mass of reports on various phases of the subject that it is somewhat difficult to disentangle the exact facts as existent. In Great Britain the creed of town planning may be expressed briefly as "more air, more accessibility, more attractiveness!" or in other words, health and social well-being, particularly as applied to the prospective building land around our towns. In conjunction with this there is at the same time, so far as private estates are concerned, a very evident effort, in some cases almost a straining, after the picturesque. In modern garden suburbs, equally with the mediæval town, the effort after picturesque features has secured many charming examples, which are a welcome relief from the drab of the everyday town. The Government housing scheme at Woolwich, built during 1915, is one of the most successful examples in this respect. So far, however, as can at present be seen, the tendency municipal town-planners under the powers give by the Act is not altogether in the same directio

Municipal surveyors, as a body, fully appr ciate the great possibilities of town planning fro the health and amenity point of view, but so fa at any rate, the "picturesque" is entirely in th province of the private owner and his architec aided or retarded by the jerry builder. In Pari the desideratum is more often the spectacula or monumental art of "*construction d villes*" in the grand manner. In Berlin "*d Stadtebau*" represents the same ideal of imposin public buildings and monumental-lookin structures which are in reality tenemen dwellings. As a well-known German profess said in 1910 at the Royal Institute of Britis Architects' Conference:—"What we in Berli try to do is, at all times and to the utmo of our power, to *impose* upon the stranger!"

American cities mostly regard city plannin from one of two ideals, either the "civic centre ideal or the "rapid transit" ideal, both of whic our American cousins would describe as "goo business propositions," and business is the ke note of all sound proposals.

Colonial towns are, as is well known, mostl laid out (for the convenience of the surveyor on north and south lines, with all streets a right angles, and, until quite recently, th tendency has manifested itself in the lay-out practically all towns which have had to b developed rapidly, generally in the absence any special natural features.

It has been necessary in nearly all cases t peg-out and sell plots of land rapidly, and th Colonial surveyor in laying out a town ha almost unconsciously come to regard it a "cutting up so many sections," simply an solely "land jobbing." The idea of a communit deliberately moulding its own growth to i future needs has so far hardly been realised.

So much for varying national ideals; but whe we consider the varying character of the Englis town itself we find almost as widely varyin ideals. Liverpool with its docks and Ma chester with its commerce, each has quit different problems from, say, the special prob lem of London or of a pleasure resort such Bournemouth. The suburban communitie too—take Walthamstow for an example—have problem all their own.

The Need for Town Planning.

One thing that stands out clearly, thoug in the maze of these different national and loc characteristics is the paramount need for som form of town planning.

Whether one sets out with the purpose sweeping away slums or of providing for t future growth; whether one is an enthusiast f parks and open spaces, or merely desirous the commercial advantages of rapid trans and business facilities, all nations and near all communities are agreed that, if it is reaso able to plan the alterations to a house that o intends to inhabit, it is still more desirable plan the town and its extension; hence t first general principle which we can all acce is the universally recognised need for tow planning.

Our first accepted principle, then, is:— *town plan is necessary.*

Following on this, however, must come t recognition that such a town plan is not a sto article, but must be made to the measu of the district. National characteristics a aspirations, as we have already seen, ha resulted in widely varying national conceptio on the subject of town planning, and localiti vary as widely in their views as to developme particularly as to the kind of development whi is suitable for their town. *A town's plan m be its own.*

Community Control.

The English Town Planning Act of 19 has focussed public attention on the subje but it should be remembered that this Act w long preceded by the Italian, Swedish, a Prussian Town Planning Acts, all of whi provide not only for town extensions and n streets being laid out on the lines prescrib by the municipal authority, but also give t authorities much greater powers of purchase expropriation. The one thing, however, whi all have in common is the need for commun

nt to Canada.

PLANNING FOR A MANUFACTURING TOWN.

At a meeting of the Institute of Sanitary Engineers held on April 5, under the Chairmanship of Mr. H. Percy Boulnois, at Caxton House, Westminster, a paper was read by M. Andre Le Marchand on "Planning for a Manufacturing Town of 50,000 Inhabitants."

M. Le Marchand pointed out that in the present day the creation of a manufacturing or industrial centre could not be undertaken without due consideration of the examples of previous efforts directed towards an ideal of comfort and welfare, the need of giving a man some beauty in his environment, and providing him with the means of enjoying the healthiest and pleasantest life possible. In the planning of a new town no sod must be moved nor a brick laid before a complete plan of the new city had been made; the proper restriction of spaces allotted according to requirement; the good disposition of roads, gardens, recreation grounds and parts reserved for cultivation; the scheme of drainage, water supply, lighting, etc., must be indicated at the outset; and the spot appropriate to each building of the new municipality must be allotted according to the conditions called for by the nature of the land, the configuration of the most suitable routes for traffic, etc. The line to be followed, and that which the town-planner should aim at, was the principle of garden cities, for the garden city was self-contained; it was industrial and agricultural, whilst forming an agreeable residential locality. The question of open spaces and the area of the land in proportion to the area of buildings was of prime importance. Property designed for a town of 50,000 inhabitants ought, apart from the rural belt (which should be two-thirds of the total area), to provide open and ample spaces set apart for public buildings, recreation grounds, squares, gardens, etc. The total area required for a town of 50,000 inhabitants would be about ten square miles. The author laid stress on the necessity of avoiding monotony in the planning of the town, and said the planner should vary the street views by judicious settings forward or backward of the building lines and vary the junction of avenues by means of "round points" surrounded by buildings of diverse designs, which points could form the connection of different avenues. Dealing with the arrangement of houses, he suggested that, whilst following the rule of an open space to each dwelling and a small garden running back from the road to the house, a successful scheme of plotting should include an adequate supply of houses grouped together, either detached, semi-detached, or in a block. Each group should consist of a limited number of houses in order to prevent the appearance of too massive a block. He thought it would be wise for the architect to seek the advice of a sanitary engineer competent to select the most suitable sites for the construction of waterworks, the installation of sewage works, for the disposal of house refuse, the location of a cemetery, a crematorium, mortuary, slaughter house, hospitals, gas and electricity works, etc. As to the style and character of the town, it rested with the architects who at different times would be called in to maintain its individual character by employing different styles which should be grouped so as to form an harmonious whole. The model city must attract at first sight by its well-conceived variety of architecture, its beauty of colour, its freshness and cleanliness. The materials chosen for the different buildings should be furnished by the country, and, above all, natural products should be used in building. For artistic reasons the construction of buildings entirely in iron or massive blocks of concrete should not be permitted, nor the use of any composition in imitation of a natural material.

PEABODY DWELLINGS, RODNEY-ROAD, WALWORTH.

These dwellings have been erected on an island site in Rodney-road, Walworth, S.E., for persons of the working classes. The dwellings consist of ten blocks, and are five stories in height. The elevations are built of red sand-faced bricks with Luton brick base, artificial stone dressings, and slated roofs. The gates and railings are of wrought-iron.

Accommodation has been provided for 179 self-contained one, two, three, and four roomed tenements, each tenement having, in addition, its own entrance lobby, scullery, and water-closet.

There has been provided, free of charge, for the use of the tenants, a detached building, comprising a steam-heated laundry, bath-house, and shelter, occupying the centre of the site. Coal stores are also provided in this detached building, where tenants can obtain coal from the fund at a low rate all the year round. The charge of 1d. per week is made for the use of the perambulator sheds and bicycle sheds. All the staircases, water-closets, bath-houses, and laundry have the walls tiled. Each living-room has a dresser and ventilated meat larder and cupboard as a combined fitting, and all the bedrooms have a wardrobe cupboard. The one-room tenements are provided with both these fittings. Hanging space is provided in addition in a recess in the entrance lobby. In each scullery there is a deep white-glazed fireclay sink with teak draining-board, coal bunker to take 3 cwts. of coal, portable washing copper and gas cooking stove. The living-rooms have the latest pattern portable ranges and hot water supply to the scullery sink. The tenants can obtain a constant supply of hot water from a tap arranged in a convenient place in the courtyard. There is a store and workshop accommodation for the use of the superintendent and porters for doing any small immediate repairs.

The buildings are of fire-resisting construction throughout. The lighting is by gas supplied to the tenants through slot meters; gas is also used for the courtyard lighting.

The buildings were designed by Mr. Victor Wilkins, Surveyor to the Peabody Donation Trust. The general contractors were Messrs. W. Cubitt & Co., 258, Gray's Inn-road, W.C.

THE BOARD OF AGRICULTURE'S REPORT ON THE SETTLEMENT ON THE LAND OF DISCHARGED SOLDIERS AND SAILORS.

THE Garden Cities and Town Planning Association asked their Architectural Committee to report upon the proposals of the Departmental Committee appointed by the President of the Board of Agriculture to report to him on the settlement on the land in England and Wales of discharged soldiers and sailors.

The Architectural Committee reported somewhat to the following effect:—That they strongly advocated the closer grouping of the homesteads and cottages than is suggested by the plan annexed to the Departmental Committee's Report, for if country life is to be made acceptable in competition with life in towns the village communities set up should certainly approximate to what has long been the envy of Colonial and Continental visitors—the old English type of village. The Departmental Committee suggested the use of wooden buildings. The Architectural Committee went on to say:—

"We are of opinion that wooden buildings are not, in themselves, objectionable, if proper safeguards are provided against fire, and a brick or concrete base is also provided, and the site is concreted to maintain dry and sanitary conditions and to keep away vermin. That wooden buildings may be very successful architecturally is evidenced by the many charming examples to be found in Switzerland, Norway, Sweden, in many British Colonies, and in America.

But we would point out that wooden buildings might not prove to be an economically sound investment if used in the proposed settlements. As the Departmental Committee's Report points out, the life of a wooden building may be put at thirty years. We would call attention to the fact that under usual conditions a brick building costs but very little more than does a wooden one, and it may be at the end of thirty years as valuable as it was on the day of its completion.

To make use of discarded "hutments," if these were handed over by the military authorities as free gifts, might be wise, however, as a temporary measure; but a cottage, like any other building, to be satisfactory must be designed expressly for its purpose and to fit in with its surroundings.

The successful wooden houses and other buildings referred to above will invariably be found to have been so designed.

At best an adapted military "hutment" would be but a makeshift substitute for a building designed for its purpose and a very doubtful economy, though some of the material from them might be re-used.

To re-use complete military hutments would tend to produce the unhappy effects which the use of stock patterns creates; but the fullest advantage should be taken of the economies and harmony resulting from standardisation of parts such as windows, doors, and, in fact, all joinery.

We doubt the wisdom of suspending building regulations and by-laws in the case of buildings erected under small holdings Acts. We should naturally wish that every consideration should be given to the proposal to do this; but we would urge that extreme care be taken that a door be not opened to a claim for similar facilities when a private individual is doing practically the same work as is undertaken by county councils when providing small holdings. It is interesting to remember that wooden buildings may still be erected in London, provided that they are 30 ft. away from any other building or from an adjoining property, and it seems reasonable that less stringent regulations should apply in the country.

If ample space be left at the roadside the made-up width of roads might, in very many cases, be not more than 16 ft. We suppose it to be unnecessary that we should point out that the accompanying diagram is, of course, merely put forward as giving in diagrammatic form some of the principles we suggest should control the planning of one of these colonies.

In every instance in which it is proposed to apply these principles to a specific site, it will be found that the conditions and nature of that site themselves dictate the proper disposition of the buildings and holdings upon it, and that a different plan results.

Still, we felt that the principles of planning we were advocating could better be indicated by using a diagram than by selecting a particular site (as the Departmental Committee did), and suggesting the way in which the buildings and holdings might be disposed upon that particular site.

We felt that the latter course would not suggest main principles so clearly, nor could it result in our producing a plan from which might be so clearly deduced principles applicable to any site.

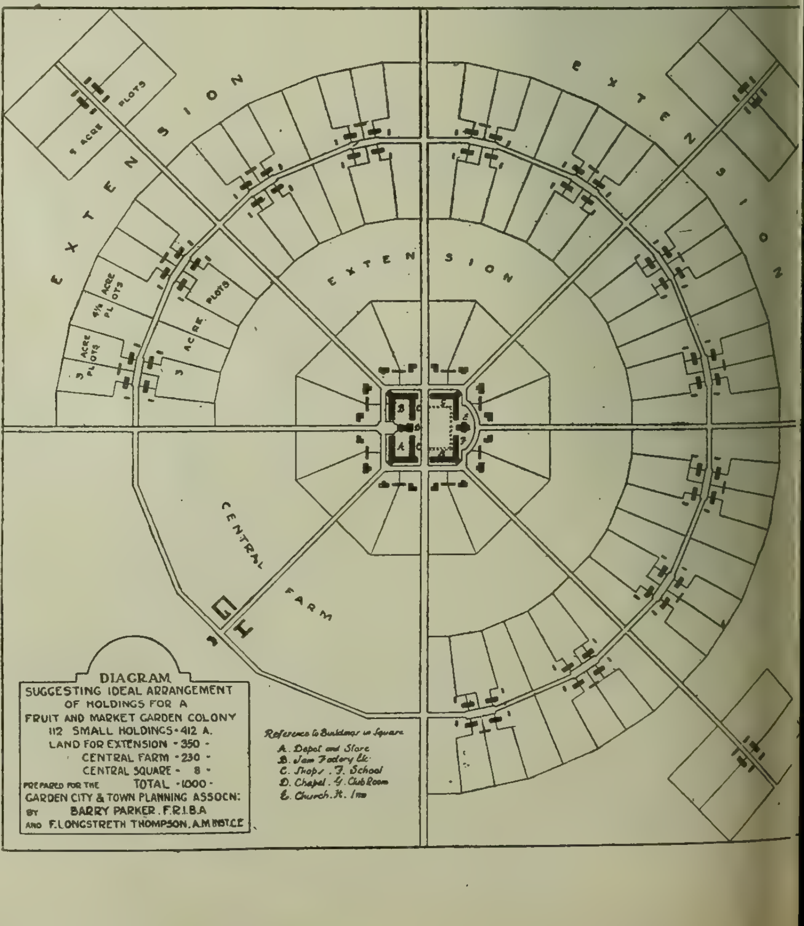
A plan for such a settlement as we are dealing with, if drawn for one site, would never do for any other site, so we felt a pure diagram would be most useful.

Our thanks are due to Mr. Barry Parker (the Consulting Architect to First Garden City, Ltd.) and to Mr. F. Longstreth Thompson for the accompanying diagram. They have assumed that the site chosen for one of these colonies would have a high road passing through it, and they have disposed the buildings in the way best calculated to reduce the cost of road-making and services to a minimum. They have brought the smallholders' cottages into groups for neighbourliness, and as close to the village social centre as is consistent with the important consideration that each cottager shall live actually upon his small holdi should be noted that, in regard to cost o making, the diagram compares favourabl the plan attached to the Departmenta mittee's Report, for, assuming the road r north and south to be an existing road i the other roads in the diagram amoun further six miles, whereas in the plan at to the Departmental Committee's Repor roads must amount to a further ten mil

Finally, we regard it as of great imp that the model plan should be one whi start all who refer to it upon lines which possibilities for architectural effects. I be said that there are no great archit possibilities in a scheme of this nature, b modest buildings at first erected will pr as time goes on, give place in many in to more important ones. To some o village communities, village halls, ins churches, clubs, and what not will be and if a plan for the whole lay-out has n adopted which provides suitable and a sites for these buildings the loss will very great one. In the least pleasing street pictures can be erected, and p grouping of buildings may result, pr that the plan adopted at the outset has em from a heart and brain sympathetic t things."

SCARCITY OF HOUSES IN GLASGO

A Conference to consider "the shortage of housing accommodation in th area" was held recently under the aus the Glasgow Labour Party Housing Ass at Govan. Five resolutions on the subje discussed and adopted. The first o called upon the Town Council to util tramway surplus, interest free, to additional housing accommodation. Th resolutions advocated the promotion Corporation of a town-planning schen securing of Parliamentary powers for of a larger area, and the assistance by the ment of local authorities in making p for adequate sanitary housing accommoda the workers. A deputation of twenty m was appointed to wait on the Town and another deputation to wait up Secretary for Scotland on his first Glasgow.



THE BUILDING TRADE.

thirty-second annual general meeting the Institute of Builders was held t Koh-i-Noor House, Kingsway, W.C., h 29. The audited accounts for the ling December 31 and the annual were read and adopted, the latter nlarged upon by the President (Mr. J. Strange). From the Report we following :—

Building Industry is passing through a eriod in consequence of the European erations of a purely building character carried out under difficult conditions, any instances have been suspended. large number of operatives usually in the trade have either obtained ent on war work or have joined his s forces. The wages paid for war ve been much in excess of those normal times, and have exerted a influence upon other callings. The of obtaining skilled and unskilled s increasing. To this may be added argo which is to be placed on the ion of certain kinds of building s. There is little doubt that the d prices of building materials and the of suitable labour will last until the he war and for some time after peace aimed. Builders realise the continued of supporting the Government in ssible way, and that it must be assisted hindered in its efforts to meet so unted a situation, however much general ons may suffer. We hail with national he action of our fellow-countrymen, g many of our members and their sons, e placed their services at the disposal ing and country; all have won renown, have been honoured with war distinc- nd some have made the supreme

ntices.—Fully realising the necessities uilding trade to make provision for its elfare, the Council has given its earnest n to the question of apprentices. er valuable co-operation could be l, strenuous efforts have been made re it. Schemes have been formulated pies forwarded to various governing At present the difficulties to contend are very great, as mere boys are now earn in temporary occupations more ey are likely to earn as adults in ordimployment. Much consideration and being given to the evils that will inevitise from present "dead-end" employn order to provide for a period when mbers of skilled and unskilled workmen needed for separate trades. To meet emergency the Council has endeavoured ecute its scheme to induce boys to apprentices and to encourage parents ake the immediate advantage of placing ns in occupations and in trades in which there is no profitable future. The present is not perhaps the precise time to introduce reforms, but it certainly is a time to prepare for the future and sow the seeds of a coming harvest. It therefore behoves all who are interested in the ultimate success of trade ventures to get things in readiness for future practical application. At the request of the Board of Trade Advisory Committee for Juvenile Employment a deputation waited upon that Committee and discussed the Institute of Builders' Apprenticeship Scheme, special emphasis being laid upon the necessity of technical school instruction and practical workshop experience being available for the craftsmen of the future. To further the interests of apprenticeship it has been decided to present annually a silver and a bronze medal to the most successful students of the City and Guilds of London Institute in our Overseas Dominions, Colonies, and Dependencies, in addition to the medals and money prizes now given to students in the United Kingdom. It has also been decided to award a silver medal each year—as a special prize for general efficiency in the theory and practice of building —to one of the students attending the Brixton L.C.C. Junior Day Schools who shall be recommended by the Brixton School of Building.

Form of Contract.—Some time has passed since this Institute approached the R.I.B.A. with a view to the formulation of an Agreed Form of Contract more in consonance with modern requirements than the form now in vogue, and to which even the R.I.B.A. itself has suggested certain amendments. At the request of the Practice Committee of the R.I.B.A., your President and Secretary, together with the President and Secretary of the National Federation of Building Trades Employers, attended a Conference upon the subject. It transpired that the R.I.B.A. has formulated a revised Form of Contract, the "draft" of which it has promised to forward, when ready, to the Institute for consideration. Some months have elapsed since this undertaking was given, but it has not yet been received. Efforts have been made by your Council to suspend any opposition that might be offered rather than take any action which might hamper the production of a revised form. Great patience has been shown, but in some parts of the country active steps have been taken to formulate, in conjunction with local governing bodies and architects, local forms for local use. Any step taken in providing an alternative Form of Contract is to be deeply regretted, in view of the fact that the Agreed Form has been and continues to be increasingly used, and it is to be hoped that when the revised document is submitted it will become mutually acceptable.

Sub-Contract.—A Special Committee has been appointed and is thoroughly taking up this matter in co-operation with the National Federation of Building Trades Employers, in conference with the London Master Builders' Association and representatives of sub-contractors' organisations, with the hope of producing a form that will be agreeable to all parties concerned. The different conditions under which sub-contractors in London and those in the provinces work is fully appreciated, and it has been suggested that two forms should be drawn up—one for sub-contractors to be appointed under Clause 19 of the Agreed Form of Contract and one for specialists and others under Clause 20. This action has been made necessary because the R.I.B.A. has declined to produce, authorise, or agree any form of sub-contract. Mr. W. H. Hope (solicitor, Sunderland) has been appointed legal adviser to the Joint Committee, and it is hoped that this Committee will very shortly be able to fully report the result of its deliberations.

Rise in Cost of Building Materials.—The rise in prices of building materials has been very marked since the commencement of the war, and is anticipated to further increase through the limitation to be placed on imports. From all over the country complaints of this have been received, but very little can be done to ameliorate the case under the circumstances. The rise seriously affects some contracts entered into before the war to which no easement has been obtained from architects and building owners. This is to be deeply regretted, as it involves contractors in serious loss.

Grants from the I.O.B. Benevolent Fund.—The following grants were made during the past year:—

1. Builders' Benevolent Institution	£50	0	0
2. Builders' Clerks' Benevolent Institution	10	10	0
3. Provident Institution of Builders' Foremen and Clerks of Works ..	10	10	0

Insurance against Risks from the King's Enemies.—Every attention has been given by the Council to the question of responsibility as to insurance against risks from the King's enemies in connection with pre-war contracts. Some building owners after considerable correspondence have agreed to bear the whole cost of the insurance premium. H.M. Office of Works have agreed to bear one-half the cost.

Timber Specification.—The R.I.B.A. forwarded a timber specification with the request for the Council's criticism. A Committee was appointed who, in conference with representatives of the Timber Trades' Federation, jointly amended its provisions and submitted these to the R.I.B.A. The R.I.B.A. writes to say that its Committee submitted its report to the Council, which decided to take no further action "as it is of opinion that, in consequence of conditions arising out of the war, the present time is not opportune for making regulations which in all probability could not now be carried into effect. It is proposed to resume consideration of the matter at the termination of the war."

The following elections were made :—

President—Mr. Leonard Horner (London).

Vice-President—Mr. Samuel Smethurst, J.P. (Oldham).

Treasurer—Sir Herbert H. Bartlett, Bt. (London).

Hon. Auditor—Mr. A. W. Sinclair, J.P. (Scarborough).

Executive Council :—Capt. R. J. Holliday (London), re-elected; Capt. F. M. May (London), re-elected; Mr. R. B. Chessum (London), elected; and Mr. Samuel Salter (Southsea), elected.

The Executive Council for 1916-17 consists of :—President, Mr. Leonard Horner (London); Vice-Presidents — Messrs. G. Bird Godson (London), Walter Lawrence (London), Edmond J. Hill (London), and Samuel Smethurst, J.P. (Oldham); Past - Presidents—Messrs. Frank May, J.P. (London), Thomas F. Rider (London), Sir Herbert H. Bartlett, Bt. (London), Mr. F. J. Dove (London), Sir John M. Burt, J.P. (London), Colonel G. M. Trollope (London), Messrs. Wm. Shepherd (London), Hy. Holloway, J.P. (London), Wm. F. King (London), Benjamin I. Greenwood (London), F. L. Dove, L.C.C. (London), Jas. Carmichael, J.P. (London), Wm. F. Wallis, J.P. (Maidstone), F. Higgs (London), James S. Holliday (London), H Arthur Bartlett (London), Ernest J. Brown (London), F. G. Rice (London), and Edward J. Strange (Tunbridge Wells); Ordinary Members of the Council—Messrs. R. B. Chessum (London), A. B. Falkner (London), F. J. Gayer (London), Capt. R. J. Holliday (London), Capt. F. M. May (London), Messrs. G. H. Parker (London), W. J. Renshaw (London), S. Salter (Southsea), H. P. Shepherd (London), F. Shingleton, M.V.O. (London), W. Thomas (Cardiff), and A. W. Turnbull (London).

A DECEASED BUILDER'S ESTATE.

The late Mr. John Bell, of Breeze Hill, Bootle, Lancs, builder and contractor, has left estate of the gross value of £67,922.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible or errors that *may* occur;—

——	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Masons' La-bourers.	Brick-layers' La-bourers.	Plas-terers' La-bourers.

TRADE NEWS.

Boyle's latest patent "air-pump" ventilators have been adopted for the offices of the Scottish Legal Life Assurance Company, Virginia-street, Glasgow.

We have been informed that a concrete reservoir containing brine was built two years ago at Droitwich, the powder Pudlo being used to waterproof the cement. A recent report states that it is still quite leakproof.

The Halstead Isolation Hospital is being supplied with Shorland's warm-air ventilating patent Manchester stoves, with descending smoke flues and special inlet ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

We have recently received samples of "Coatostone" (liquid stone), which, laid on with a brush, gives the effect of natural stone when applied to plaster, cement, wood, or other surfaces. It is supplied to imitate any well-known building stones or to any tint desired. It will not injure brushes, and can be used like ordinary paint, laid off evenly and stippled. It can be applied to old cement stucco or terra-cotta fronts, which are thus made to resemble stone, and generally it is a very useful material for producing the effect of actual stone. The rights in the name "Coatostone," together with the goodwill of the business of the "Coatostone Decoration Company," were acquired some time ago by the Stone Preservation Company, Ltd., 9A, Little James-street, Gray's Inn, London, W.C.

In view of the embargo placed upon paper, both as regards price and output, our attention has been called to the wall lining "Fiberlic," which is a building or wall board of considerable hardness and rigidity. It requires no papering, and one or two coats of oil paint or distemper will give a very pleasing effect. The monotony of an unbroken wall, which is sometimes the objection with distempered plaster walls, is relieved with thin moulding strips which are used to cover the joints where the sheets meet. The "Fiberlic" Board is manufactured by Messrs. MacAndrews & Forbes, Ltd., Finsbury-court, Finsbury-pavement, E.C., who will send to any interested reader schemes for panelling according to the size and kind of room. The board is fire-resisting, sanitary, vermin-proof, odourless, and it is also a non-conductor of heat, cold, and sound.

TENDERS.

GOOD FRIDAY WEEK.—In consequence of the Easter holidays, we go to press a day earlier than usual next week, the *Builder* being published on Thursday. All communications must reach the Editor by *first post on Tuesday morning*.

* Denotes *accepted*. † Denotes *provisionally accepted*.

BOURNEMOUTH.—Accepted by the Borough Council for the supply of coarse or rough gravel for the year ending March 31, 1917 :—

Coarse binding gravel, delivered to Central District, 6s. 4d. per cube yard; East District, 6s. 11d.; West District, 5s. 6d.; and North District, 5s. 6d.—G. Maidment.

Coarse gravel, delivered to Central District, 5s. per cube yard; East District, 7s.; and North District, 4s. 6d.—J. Francis.

Coarse gravel, delivered to West District, 5s. 6d. per cube yard—G. Maidment.

BOURNEMOUTH.—Accepted by the Borough Council for the supply of fine gravel and nut gravel, for the year ending March 31, 1917 :—

Fine gravel, delivered to Central District, 4s. 9d. per cube yard; East District, 5s. 6d.; West District, 4s.; and North District, 4s. Nut gravel, delivered to Central District, 6s. 6d. per cube yard; East District, 6s. 11d.; West District, 6s.; and North District, 6s.—G. Maidment.

DUDLEY.—Accepted for 300 houses in connection with the housing scheme. Mr. John Gammage, C.E., Borough Surveyor :—

W. Roe, Wolverhampton, for thirty houses; T. Higgs, Northampton, for fifty-four houses; Jenkins & Davies, Rhondda, for forty houses; Rogers & Son, Cardiff, for eighty-six houses; Dudley Amalgamated Builders, for ninety houses—total, 300 houses.

GRASSINGTON.—For the erection of a new branch shop at Grassington, for the Skipton Co-operative Society, Ltd. Mr. James Hartley, architect, Skipton :—

T. T. Chapman, Bowers-yard, Skipton; W. V. Patrick, Grassington, near Skipton; F. Bayley, Grassington, near Skipton; G. H. Mason & Sons, plumbers, Skipton; A. Shuttleworth, Water-street, Skipton. Total, £1,100.

TONYPANDY.—For alterations, etc., to Nos. 62 and 63, Dunraven-street, Tonypandy. Mr. E. I. Evans, architect, Tonypandy :—

E. R. Evans Bros.	£498	10
W. Spratt	458	0
T. Lewis	451	7
J. Thomas	450	0
J. Lovatt, Penygraig, Rhondda*	415	0

SUNBURY-ON-THAMES.—For supplying to Urban District Council of not less than 250 t of granite; also 200 tons of slag tar-macad. Mr. H. F. Coales, A.M.Inst.C.E., Surveyor :—

Granite : J. Mowlem & Co., Ltd., 21s. 6d. per t British Macadams, Ltd., 21s. 1d.; W. Griff & Co., Ltd., 18s. 9d.; Rowe & Mitchell, 18s. Brooks, Ltd., 18s.; Ellis & Everard, 16s. H. L. Cooper & Co., 15s. 11d.; Abdon Clee St Co., Bridgnorth, 15s. 11d.*

Slag tar-macadam : Constable, Hart, & Co., 17s. and 18s. 9d.; J. Oakes & Co., 18s. and 18s.; Prestwich & Sons, 18s. and 18s.; J. Wainwr & Co., Ltd., 17s. 8d. and 17s. 11d.; H. L. Co & Co., 17s. 4d. and 17s. 4d.; Tarmac, I Ettingshall, 17s. 3d. and 17s. 9d.*

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

DL. CX.—No. 3820.

APRIL 21, 1916.

THE RAILWAY-STATIONS OF LONDON.

T is doubtful whether the average citizen bestows more than a casual glance upon the architecture of the terminus of his particular line of railway, much less is he familiar with the character of the whole class. For Londoners have come to accept the metropolitan ini with easy tolerance, notwithstanding their utilitarian ty and ugliness. In a vague kind of way those who ent the stations realise the brutal driving force of the strial age which called them into being, and consider such lings to be mere engineering blemishes on the body of lon, softened to an imperceptible degree by the machina- of Soot, Fog, Gas Coal, and Company. Yet these gency exits to the outer world have a charm entirely own. It rouses the imagination to think of the steel enmeshing the fair counties of England, bringing distant within a few hours' swift journey; moreover it is uraging to peep behind the scenes at the panting es that have brought in trains from the Continent or rica. To visit the representative stations would need a leisure, and if we desired to subject each terminal to al analysis a week of strenuous labour would not be ient. We can, however, conduct a flying tour from the hs of an easy-chair, skim a mass of unintelligible and statistics, and devote our thoughts solely to the -comic aspect of the issue. A start can be made upon doyen of the band, Euston. In a chronological sense on is the oldest and the most important; its adamantine vay—a monument by Hardwick, symbolising the linking of ingham to London in the first years of Victoria's reign— s even to-day the look of a Gulliver fearful of crushing Lilliputians.

he original name of the London and Birmingham Railway ong since been swallowed up by the ramifications of the lon and North-Western system, an apt modern rendering e Biblical story of Aaron's rod.

uston is a secret labyrinth from whence travellers are ted off in a mysterious way. The hall, with its range of columns, is strangely Eleusinian; even the officiating ts are doubtful of some of the passages, and to find the en platforms denotes an intelligence of a very superior order. hard to realise that such a heterogeneous growth of train s, stores, and offices heads one of the most scientifically nised railways in the world. Euston as a railway puzzle teresting and entertaining for its human flavour, but it t a civic monument like the Gare du Nord in Paris.

wo miles away stands Paddington, with its breezy air of West Country. It is a structure resembling the hoops of inoline. The hotel, garbed by Hardwick in Victorian an fashion, with a clasp brooch of Baroque design as its jewel, tries to screen the crinoline skeleton, but latterly her hoop has been added to accommodate the expanding e of the elderly lady. Brunel designed the iron roof in us Oriental taste and stamped his personality on the place. immortalised it, and every day the incidents of the famous re are re-enacted.

n the days of the "railway mania" Waterloo was a us rival to Paddington; what is to be said for it in the es of reconstruction? The new structure is certainly open spacious, the plan reflects a continental interest, but it s the smoky charm of yesterday.

aterloo is a military and naval station as befits its opriate name; it is enormous, and large enough in fact to mmodate an army corps. The architecture of Waterloo, ts second youth, defies analysis. The train sheds are utilitarian, but the refreshment-rooms are luxuriant, and that is all that can be said for it.

For a more glaring example of British incompetence in these matters we can visit the twin stations at Victoria. Oh, that the shade of Pugin could revisit London and edit a new volume of Contrasts, the frontispiece would certainly be the façades of Victoria! Having risked our limbs in a perfect whirlpool of motor traffic, we reach the station-yard and find two buildings joined like Siamese twins in painful solemnity. Neither has the least sympathy for its neighbour, and both express discontent at the lordly insolence of the Grosvenor Hotel, which refuses to recognise the existence of the usurpers. Passing through to the terminus of the Brighton line, we find the longest platforms in England, interminable in perspective, with Clapham Junction at their southern extremity. The western rampart to the station is interesting as a blank wall, but it leaves the enclosure of the South-Eastern and Chatham line to chance. We depart from the twin abortions of Victoria with a feeling of depression and make for Charing Cross.

Here a further surprise awaits us, for it comes as a shock even to those with a knowledge of London to find a terminus thirty seconds from Nelson's Column. How the railway magnates of the mid-Victorian age must have chortled when they secured the demolition of Hungerford Bridge and Market, and how conceited they were to attempt to span the Thames with an economical centipede bridge and to cloak their doings with a nondescript hotel! The promoters of this monstrous scheme evidently feared public censure, for they threw a sop to the Gothic Cerberus by manufacturing a pseudo-mediæval cross, and so found a name for their station. Having broken into London in the west, the directors of those days used the same plans for the bridge and hotel at Cannon-street, only the cross was omitted.

Just across the river Mocatta's Italian rendering of a station façade is buried in a forest of additions. London Bridge recalls a nightmare or troublesome dream. The timorous passenger is faced with impossible approaches, tortuous bridges, fearsome alley-ways, and cavernous entries. The *tout ensemble* is indescribable, and with its crudity is a self-accusing monument to the exigencies of commercial necessity. London Bridge never appears to us in any other light than being an appanage to some greater terminus, an enlarged and more terrible version of a New Cross or a Croydon, which has crept as near the Thames as it dared, and then, fearful of discovery, has fortified itself within a ring of menacing girders.

Turning to the heart of the City, we encounter the low sweep of the iron roof of Fenchurch-street, timidly fearful of its unwarrantable intrusion into the busy world. This structure is a shipping station. Its face speaks of Tilbury Docks and riverside wharves; it appears anxious regarding the times of sailings from the offices of the steamship companies in Leadenhall-street, and then, as if fearful of its own precocity, tries to hide its ugly head amid the surrounding desolation.

The terminus at Liverpool-street is not wholly unattractive despite its Gothic dress, now sadly besmirched with soot. It is customary to take our American friends to this station to point out the vastness of its site and boastfully quote data concerning the thousands of passengers who daily stand beneath the umbrageous roofs. There is something indefinably Victorian about Liverpool-street; it is so easy-going, and we have such pleasant memories of sketching tours to East Anglian villages or quiet river estuaries, as well as an adventurous tour to York by Cambridge, Ely, Peterborough, and Lincoln.

B 2

Yes, Liverpool-street is a decided improvement on the once wooden walls of old Bishopsgate, the terminus of the Eastern Counties Line.

By comparison with its feudal companion Broad-street is a demure Victorian lady. This terminus is not the head of a trunk line, despite the lofty position of the railway tracks and the ostentatious cast-iron crestings on the crude pavilion roofs. But notwithstanding it has the elements of romance, for certain London and North-Western expresses start from here on their popular run to Birmingham.

Three more stations remain to be considered. They are King's Cross, St. Pancras, and Marylebone. The first named was built by Cubitt in the middle 'fifties; it is a well-bred station, with Scottish connections. Its stern aspect stirs our interest for the distant North. Within a stone's-throw of the pavement we can see the escaping steam from the Scotch express. Even the clock turret and its Tam-o'-Shanter cap expresses the wistful look of a newly-arrived Highlander, apparently scanning first the gigantic figure of a Bloomsbury landlady and then glancing towards the heights of Pentonville, as though undecided between comparative luxury or obscure economy.

St. Pancras, across the way, is an opulent structure, recalling the ostentation of the Midlands and Lancashire. It is vast, picturesque, and romantic, for its pinnacled silhouette brings to mind the whole range of cathedrals. The plan of this station is the best in London, for it is based on a Continental model. The concourse is spacious and the approach roads have an air of directness which goes far to atone for the display of hard mediæval features. Sir Gilbert Scott designed the architectural attribute and schooled engineers as to the shape of the steel vault. After 1870 Gothic tradition became an obsession with the Midla Company, for the style was exploited even to Leicest beyond this the line is dedicated to Paganism.

The railhead of the Great Central is practically unkno to Londoners, although more familiar to our cousins fr Sheffield. It is a garish accretion of soulless brick and ca iron, a hopeless example of incompetence in architectu expression. Those who make frequent pilgrimage to Chilterns have the choice of Baker-street or Marylebone, the spectacle of steam-drawn trains forms the greater attracti hence the fame of the newest arrival to the metropolis. is unlikely that the future will witness the intrusion on Londo threshold of further trunk lines, and the reputation Marylebone will rest on the fact that it was the last, as Eus was the first, of eighty years of railway achievement.

There is a human touch in the aspect of the terminals the metropolis, for these ill-designed centres are an index the characteristics of the people whose commercial ne called them into being. It has been declared that the sp of romance, in its wider aspects, was banished with coaching days, but only those without eyes to see can d the interest attaching to modern travel.

During this hasty round of the termini, architecture a to that of railway structures in Paris or New York has b conspicuous by its absence, but we should not forget that energies of the Victorians were directed to strewing the coun with cinders and not to designing architectural monume of civic interest.

◆

NOTES.

St. Paul's.

CANON ALEXANDER states that £35,000 out of the £70,000 which is required to carry out the necessary structural repairs to St. Paul's has now been collected, and that the "critical" part of the work is almost completed. The foundations have not yet been touched, and it is said that the work to be done will be carried out gradually over a long term of years The Canon added that an efficient system of fire protection for the building had now been inaugurated, so out of the evil and alarm caused by the recent air raids good has come, and they may have made the preservation of St. Paul's to posterity more certain and assured than it was before. We wish its preservation from the mistakes of decorators was equally assured, as it is in that direction that most damage may in the future arise. In the epoch in which it was erected painting and not mosaic was considered as the most suitable means of colour decoration, and we feel the instinct of its builders was the right one.

The Shakespeare Tercentenary Celebration and Shoreditch.

IT is commonly believed that Shakespeare, upon coming to London in 1586, found employment at The Theatre and the Curtain Theatre in Shoreditch. James Burbage, carpenter, and a member of the Earl of Leicester's company, had built, near the Finsbury Fields, The Theatre—the first playhouse erected in London—ten years previously. It stood in Deane's-mews, upon a site that has been identified at the west side of King John's-court, between New Inn-yard and Holywell-lane. Close by, to the south, is the site of the Curtain Theatre, wherein "Romeo and Juliet" was first performed in 1596, "Henry V." three years afterwards, and, in 1598, Ben Jonson's "Every Man in His Humour"—*teste* J. O. Halliwell-Phillipps.* The Curtain, it seems, was situated at the east end of Hewett, formerly Gloucester, street, a cul-de-sac leading eastwards out of Curtain-road, and the "Curtain-court" of Peter Chasseraw's "Survey of St. Leonard, Shoreditch, parish," made in 1745. The two sites, which will be permanently indicated with tablets in the course of the celebration of the current month, lie within the Liberty of Holywell, and in the precincts of the dissolved Priory of Holywell, but are without the verge of the City boundary, and therefore beyond the jurisdiction of the Corporation, who forbade the performance of plays within the City. In April, 1576, James Burbage took from one Giles Allen a twenty-one years' lease of houses and lands for The Theatre, upon which he expended some £650 in all. In the winter of 1598-9 his sons, Cuthbert and Richard Burbage, employed Peter Street, carpenter and builder, to dismantle the structure, and with the materials to erect the Globe, in the Liberty of the Clink, Bankside, Southwark.† We may conclude, then, that The Theatre was, and the Curtain, too, after the "wooden O" kind—that circular in form with an arena for the "shows"—open to the s and having a removable stage for the plays that could be projec into the pit. The apposite style of the Curtain was derived fr the name of the ground which, as we read in the "Outlines," was ca the "Curtene," lying outside the main south gate of the Priory, is cited under that name in a lease of 1538. A "house . . . called the 'Curtayne' [not being the playhouse], and a parcel ground . . . called also the 'Curtayne Close,'" are specifie a deed of 1581 as "sometimes appertaining to the late Priory Halliwell now dissolved."*

The Committee on War Damage.

THE Committee on War Damage, which holds t the Government should assume responsibility damage to private property caused by acts of w has received the support of a large number of municipal authorities of influential cities. T Lord Mayor of York is its President, while the Lord Mayors Cardiff and Belfast and the Lord Provost of Perth are among its V Presidents. We are not sure whether the Committee are justi in their standpoint, though we should be glad to see private individu protected from all disasters which might arise out of the state of w The Government has assumed responsibility for shipping los as it is vital for the country to maintain its imports and expo otherwise such a step in view of its enormous cost would not justified from the point of view of national finance. It is necess that the private shipowner should be encouraged to risk his proper but this cannot be said to be the case with private property a whole, and it is questionable whether the authorities would be w advised in adding to the taxpayers' burdens.

The Associazione Italiano Acquafortisti e Incisori.

AT the Galleries of the Royal Society of Brit Artists in Suffolk-street a most interest exhibition of the work of the Italian Society Engravers and Etchers is being held concurren with that of the Royal Society of British Artis and one-half of the proceeds of sales are devot to the Italian Red Cross Society. No one shou miss the opportunity of seeing work which is characterised a whole by amazing freedom and force, and is devoid of any pronoun tricks of mannerism. A large proportion of the subjects treated architectural in character, and among them are many signs that spirit of Piranesi is yet alive in modern Italy. Among a collect of unusual merit the work of Cesaro Fratino stands out. In No "Iron and Stone," he gives us an impression of St. Peter; in No. 14 vigorous design for a drop scene; and No. 126, "The Angel of Cupola," all characterised by masterly drawing and dramatic for Of quite another quality, but perfect in its way, is No. 63, "Certos by Chiappelli; while the "Apse of the Cathedral at Modena," No. by Ubaldo Magavacca, shows yet another rendering of an architectu subject. The exhibition includes works by Sartorio, Maroni, many who are helping to build up a great artistic era in the coun which saw the birth of modern European art.

Y VIEWS OF THE "WONDER OF WORK."

By Joseph Pennell.

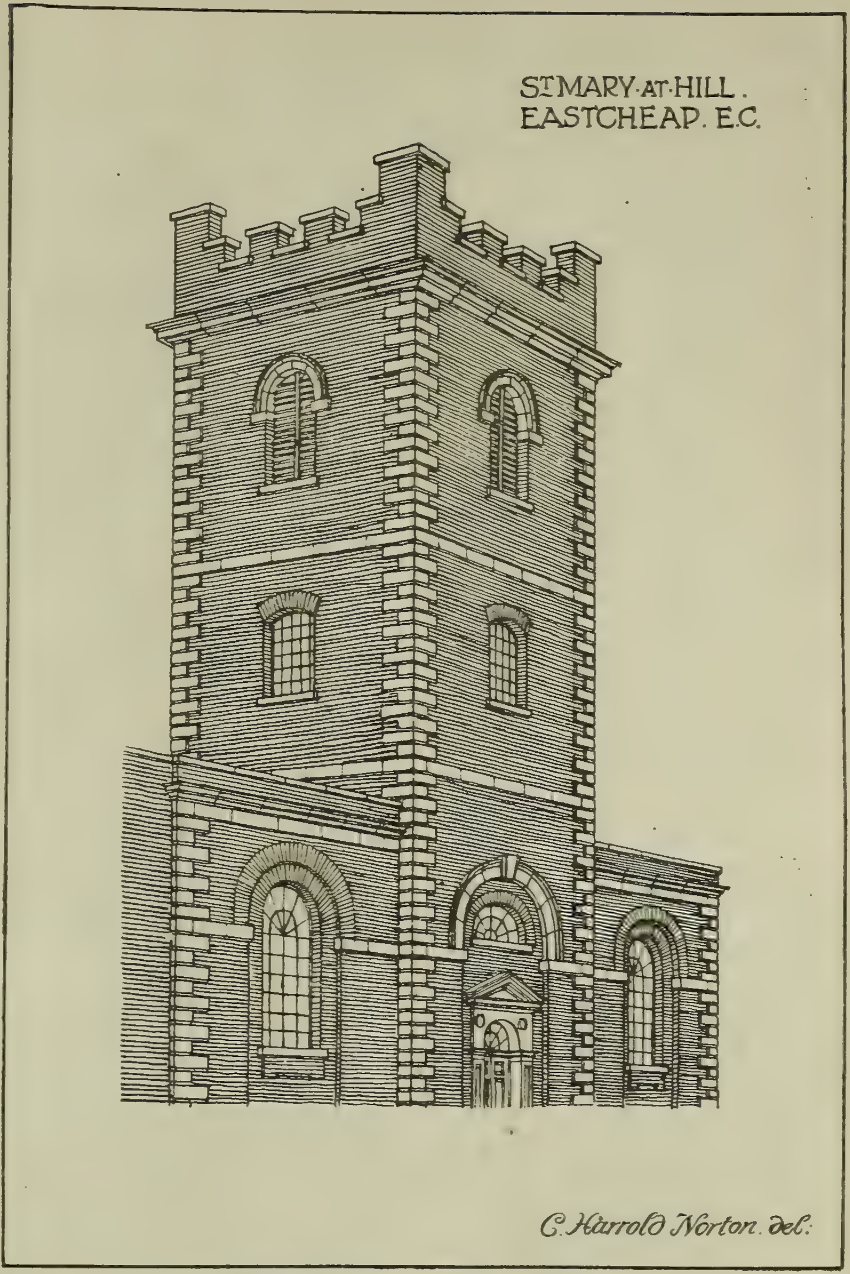
SEND you, in response to your "Note" t you would like to hear more of my iews" about the "Wonder of Work," atement of them—a statement put before editors of *Engineering* and the *Studio* rejected.

[y work, I hope, lacks that "detail which ains in a good photograph, such as those imilar subjects already published in our ur] pages." I hope so! What I have all life been trying to show in my work just this, that there is something in ineering work—the great work of our —greater, finer, more artistic than any r mean machine-made photograph, e or detail drawing, can ever give. I have n, by my drawings and prints of the at works of the day—the great engineering ks—trying to show that they are as fine the temples, the churches, the palaces the past. In fact, that the great engineers of the present are doing just the k in the same way that the great archis of the past did. The architects of the worked for the popes, the princes who d the world. The engineers of the present k for the captains of industry, who own world to-day and run it—or think they Art has always followed commerce, commerce and industry rule the world— the war—to-day. My drawings and ts were not done with any war-like idea my head, but to show how pictorial k is.

have seen most of the great engineering architectural works of the modern ld and most of the great temples and ces of the past, and I know of what I k. I know that great engineering is t art; I know that great engineers are t artists, for the greatest triumphs of neering have been carried out in the t of great art and have produced great not to be rendered by niggling photohs or scale drawings. Let me give you xample. When I was at Panama four s ago I found in the lock at Pedro uel a series of flying buttresses as fine hose of any cathedral, and when I asked engineer—a civil engineer, by the way— Williamson, why he had built them in architectural fashion, especially as they ld be mostly under water, he said use they would best support the lock s, save concrete, and break the force of waves if a storm came on. It was just these reasons save the latter—and the edral builders thought of the wind—that built their buttresses. The trouble you engineers is that you are great ts and don't know it, nor did the cathebuilders; but they knew their work, so do you, only you don't know what have done. But I do!

ake again the drawing of the interior of an Shipbuilding Yard at Hamburg in show of "Germany at Work" at the ester Galleries. The lines are as fine he lines of the interior of the roof of rborough Cathedral, and the same —but the modern architect don't know r most of them don't—and both are the of the roofs of Greek and Egyptian ples which were right from the engineerstandpoint; and a modern fool of an neer destroyed one of the temples of pt—or the Egyptian or British Governt did! The great cranes on the Rhine at Gary and Indiana Harbour are e beautiful than anything in modern itecture.

he steel works at Leeds are superb, and so the Edgar Thompson works at Bessemer. great Lifting Bridge at Sault Ste Marie ner than any gateway of the past, or any gateway a modern architect has built; and the line of the new Connecting Bridge at Hell Gate, New York, when last summer it was being built, was terrifying in its power and might. I could go on for a week and show what wonderful works you engineers have made, and prove to you that you are, or were, till this damnable war broke forth, doing the great work of the world to-day—you, the authors of the "Wonder of Work," are the artists of our time, but you don't know it, can't see it, and prefer photographs and measured drawings, untrue and uninspiring. It was just the same with the cathedral builders; you have to get an artist to show you what you have done, and then you want photographs to prove it—lying photographs.



ST MARY·AT·HILL.
EASTCHEAP. E.C.
C. Harrold Norton. del.

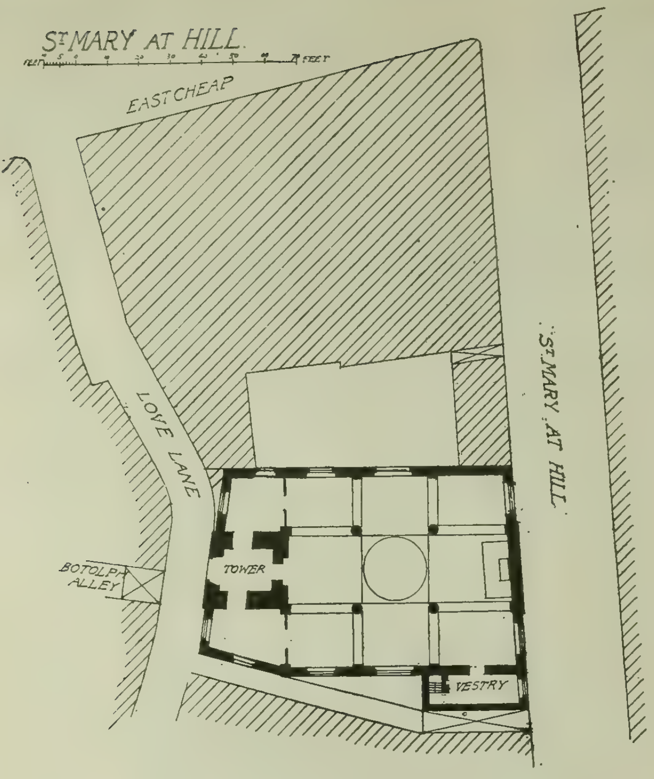
Wren's Churches. (*See page* 294.)

I salute you as great artists, the artists of our age; but in your appreciation of art, in your knowledge of what you have done artistically, you are most of you "fools and blind."

As to the drawings. It was curious and interesting to have the chance of comparing the building of the Woolworth Building with the rebuilding of the Campanile—both of which I was fortunate enough to see and draw, both the result of successful commerce. Nowhere in the world is there such an amazing vista as this down Broadway; and yet scarce anyone pays any attention to it; it has grown up with the generation; but if it was in Europe, on the Continent, the world would rave over it.

And at Genoa, the harbour to-day is only the harbour Claude drew and painted, only it is glorified and magnified; and the interior of the shipbuilding yard is but the carrying on and carrying out the traditions of great art. It is only the methods and the materials that have changed, not the form and the line—they were right from the beginning; and all great artists know they can only carry on tradition, and hope to add a mote of their time—of their own—to it.

The skyscraper is common enough in Italy. At Genoa there are streets of them; New York is but Genoa and Florence brought up to date and made useful and practical, and magnificent as well. We have—or rather American architects have—done this. It is not American art; it is great art. The only American art that I know of is the concrete, steel, and glass factory, and this idea—an American one—has been far better carried out in Germany. We must carry on in all art tradition; the trouble is that most don't



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

carry it on, they fall down before it, or fall down within it, as the various "ists" do. They consciously crib from the primitives, and give themselves away. The primitives unconsciously produced great art; we can only try to bring this great art into our own time, make it fit our needs. If we don't try to do so we are doing nothing for our age and generation, and it is all so difficult; but the artists, and, as I began by saying, engineers and architects are artists. And the great industrial works of our day are as well worth drawing as the great religious monuments of the past. They are the great art of our day, and few artists have drawn and painted them in their might and beauty. No artist that I can find has left any record of the building of the pyramids of Egypt, or the temples of Greece, or the theatres of Rome; we draw their ruins and ignore the finer subjects that are around us—at least most of us do. It is no question of letting the dead bury their dead—art will always live—and we must see the Wonder of Work which is all about us in the living present and carry on the tradition of great art.

JOSEPH PENNELL.

◆

BURNHAM ABBEY REOPENED.

The ancient abbey at Burnham (Buckinghamshire) is being reopened for use by an Augustinian community. The "Burnham Parish Magazine" for the present month says:—"The Abbey was founded on April 18, 1266, and continued until 1539, the members of the community of Augustinian nuns quietly doing the work they had set themselves to do. On September 19 of that year the abbess and nine nuns took their sorrowful departure, and the buildings which had been given and dedicated to the glory of God "for all time" fell into ruin and became a farm. The original chapel has entirely disappeared (only the abbess's seat remaining), while the chapter house was used as a cowshed. In 1914 Mr. Bissley acquired the property and determined to restore as much of it as possible. Aided by an unusually expert technical knowledge, he has succeeded in restoring parts of the original buildings.

THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. XXVIII.—St. Mary-at-Hill.

THE church of St. Mary-at-Hill abuts the street of that name and Love-lane which connect Eastcheap and Billingsgate. The church, which replaced an earlier one, was built between the years 1672-77, but the tower, which had escaped the destruction caused by the Fire, remained standing till 1780, when it was demolished and the existing one erected. The former tower is shown in an illustration in Maitland's "History of London." The church externally has little merit; the interior is among the most beautiful of any of Wren's work. The plan, like that of St. Anne and St. Agnes, is based on a square of four columns, the entablatures over which support semicircular plaster vaults, the centre being emphasised by a low dome with lantern, and the whole proportion and scale is handsomer and bolder than that of St. Anne and St. Agnes, while the woodwork is especially interesting and well designed; but the church is so dark that it cannot be well seen except by artificial light. Much of the carving was added when the church was repaired in 1848-9, but is well executed and in harmony with the structure. With the parish is united that of St. Andrew Hubbard, which church stood in Love-lane and was not rebuilt after the Fire. The advowson of St. Mary has since the time of Charles I. been in the hands of the parishioners who purchased it.

◆

FARM LABOURERS' COTTAGES.

Mr. W. H. Gaunt, land agent, Letchworth, believes in regard to rural housing that with a reasonable price of wheat in view some problems of farm labour being unable to pay an economic rent would disappear. The Government, he thinks, should have more courage in taking risks in advancing money to any reputable building organisation for cottage property to lessen the need for tied cottages.

Professional Announcement.

tenancy of the chambers at No. 14, gham-street, Strand, W.C., having l, it is requested that all letters and for Sir Thomas Graham Jackson, R.A., may be addressed to him till further at Eagle House, Wimbledon.

Professional Conduct.

Council of the R.I.B.A. at their meeting nday, April 3, passed the following on:—“That the payment by any r or Licentiate of the R.I.B.A. of a fee mission to any person in respect of his fices in introducing work is unprofessional all grounds to be avoided.” The Council rdered this resolution to be added to ofessional Conduct Regulations, pub- n the R.I.B.A. *Kalendar*, page 70.

he Morgan Bronzes and Enamels.

ake the following from the *Times* of last y:—“A further serious depletion of rgan loan collections on exhibition in etropolitan Museum, New York, has d through the acquisition from the estate by Messrs. Duveen Brothers, of rk and Paris, of the famous Renaissance , the Limoges enamels, and the majolica The price paid is understood to be neighbourhood of £800,000. The three ns comprise about 500 specimens.”

The Royal Academy.

e House of Commons on Monday, reply- Ir. Fell, the Chancellor of the Exchequer “Exhibitions of pictures, whether by a or a private individual, will be liable amusements tax unless they fall within mption in Clause 1 (5) (*a*) of the Finance Duties) Bill as amended in Committee in the further exemption contemplated amendment as to entertainments pro- for partly educational or scientific s which stands on the paper in my I am advised that the Royal Academy ons and the ordinary form of one- hibitions will be liable to the tax.”

chitectural Association of Ireland.

H. G. Leask (President) presided at a of the Architectural Association of recently, at 15, South Frederick-lane, when Mr. C. J. M‘Dowell delivered a on “Celtic Art.” The lecturer said, ourse of his remarks, that in no country world was the art of building in stone out to greater perfection than in The beauty of design and decoration d in the high crosses, the metal-work, illuminated manuscripts were unexcelled re. Here it was possible to trace the of building in stone from the most and primitive beginnings, in the form ens and sepulchral mounds, to the bee- lls from which the rectangular stone- oratories were evolved. The outgoing were unanimously re-elected for the year.

yal Institute of the Architects of Ireland.

ordinary meeting of the Council of this e, held at No. 31, South Frederick-street, recently, the President, Mr. R. d Orpen, B.A., R.H.A., in the chair, the g resolution was passed:—“The Council Institute desires to place on record its the great loss the profession of archi- has sustained in the death of Robert ne, I.S.O., LL.D., F.S.A. For thirty- ears he loyally supported the Institute, a member and afterwards as a Fellow. s a Fellow of the Royal Institute of Architects. A man of cultivated nd wide sympathies, he filled with ion the position of his Majesty's or of Ancient Monuments in Ireland, on he was specially qualified to occupy o his extensive knowledge as an anti- and his professional training as an t. During the period of his office the f restoration and preservation of the buildings of Ireland was carried out sympathy and skill which his fellow- ts widely appreciated.”

Proposed Purchase of Rossetti Pictures.

The trustees of the late Mr. George Rae, of Liverpool, have offered to the Committee of the National Art Collections Fund his collection of pictures by Dante Gabriel Rossetti. There are ten oil paintings and ten water-colours and drawings, nearly all of the artist's finest period.

Caxton Hall, Westminster.

Councillor Leonard Stokes submitted the proposal at the last meeting of the Westminster City Council that Caxton Hall should be sold and the proceeds invested in War Loan, but his motion was rejected by a large majority. He said that the site alone was worth £50,000, and its only “return” was a loss of £65 a year.

Architects' and Builders' Supplies, Australia.

The managing director of a firm of architects' and builders' specialists who is shortly proceeding to Australia desires to hear from one or two high-class United Kingdom manufacturers desirous of opening up business in the Commonwealth. Communications in this connection should be addressed to the Secretary, Chamber of Commerce, Liverpool.

“Concrete and Constructional Engineering.”

The issue of *Concrete and Constructional Engineering* for April contains several useful articles, including:—“Concrete Work on the Copenhagen Underground Railway,” by Mr. Georg Brockner; “Reinforced Concrete Warehouse, Manchester,” by Mr. E. G. Souster, A.R.I.B.A.; and “Resistance of Concrete Sea Wall to Heavy Storm.” The issue contains many interesting illustrations.

War Housing in the United Kingdom.

In the House of Commons a few days ago Mr. Muldoon asked the Secretary to the Treasury whether he could inform the House of the amount of money advanced by his department to urban councils or otherwise to provide housing accommodation for munition and war workers where a special necessity arose since September 1, 1914; and what amount had been expended in Ireland, England, Wales, and Scotland respectively. Mr. Montagu: “The following issues have been made by the Treasury to Government departments under the Housing (No. 2) Act, 1914—England, £824,000; Wales, *nil*; Scotland, £20,700. No issues have been made under the Housing (No. 2) Amendment Act, 1914, which extends the provisions of the above Act to Ireland. The hon. member will understand that the above figures relate to issues by the Treasury only, and not to grants made by other public departments.”

Compensation for War Damage.

The Committee on War Damage, which represents 370 municipalities in all parts of the United Kingdom, met at Guildhall on Thursday last week to urge the Government in the name of 11,000,000 people to abandon the scheme of war damage insurance, and to provide out of national funds for compensation to those who suffer damage from the attacks of the enemy.

The Lord Mayor of York, who presided, said that the executive wished to avoid anything which could hamper the Government in the prosecution of the war, and would not present their memorial to Mr. Asquith until they could prove that they had public opinion at their back. They would try to convince the Government of the equity of their demands, but if they failed they did not intend to raise any discussion in Parliament till the war was over. The Mayor of Gateshead proposed and it was resolved:—

“That in the opinion of this meeting the Government scheme for insuring against loss or damage by aircraft and bombardment, which had made individual citizens responsible for war damage inflicted on them by the enemy, is manifestly unjust, and it hereby agrees to present a memorial to the Prime Minister urging the abandonment of the scheme; and (1) the adoption of an Act recognising national-responsibility; or (2) reversion to the policy adopted prior to the introduction of the insurance scheme, with compensation for sufferers out of national funds, a condition of the withdrawal to be that the premiums already paid under the scheme should be returned.”

Memorial to W. G. C. Gladstone.

As a memorial to Lieut. W. G. C. Gladstone, M.P., a rood in the village church of Hawarden, given by the Hon. Mrs. W. H. Gladstone and her daughters, was dedicated by the Bishop of St. Asaph on Thursday last week. The rood was designed by Mr. Gilbert Scott, and a suitable inscription is given on an alabaster tablet.

Housing the Liverpool Poor.

In connection with the clearing away of insanitary areas and rehousing the dispossessed tenants, Liverpool has completed twenty-two blocks of dwellings numbering 2,747 tenements, of which 2,193 are reserved exclusively for those people who have been dispossessed. They are, generally speaking, three stories in height, and consist of one, two, three, and four rooms, with rents ranging from 1s. 9d. to 6s. per week. There are also a number of self-contained houses of four rooms, the rents of which are 7s. per week.

Progress of Town Planning.

Since the Town Planning Act came into force and up to March 31, 1915, a period of about five years, advantage was taken, under Part II. of the Act, in England and Wales, to the following extent:—Number of local authorities who had received authority to prepare schemes, seventy-four; number of schemes for which authority to prepare had been given, 105; acreage of areas dealt with, 167,561; number of schemes made, seven; number of schemes approved, four. Subsequent to March, 1915, seventeen local authorities have received authority to prepare eighteen schemes. Besides these, it is understood that application for authority had been made, or preliminary notices served, in respect of upwards of forty other schemes.

Dante and Westminster Abbey.

Miss Troutbeck delivered a lecture on the 13th inst. before the Dante Society in the Jerusalem Chamber on “Memoirs of Dante in Westminster Abbey.” The Abbey and this “Divine Comedy,” she said, were linked as symbols of the national greatness of England and Italy, and it would be strange if the building and its historic significance had escaped the encyclopædic mind of the poet. There was a direct allusion to the Abbey in the “Inferno,” but its special interest for Dante students lay mainly in the many tombs, monuments, and shields, recalling memorable figures appearing in Dante's pages. She called attention to many of these memorials, notably the royal tombs that recalled passages in the beautiful “Valley of the Kings,” and described some of their artistic, architectural, and heraldic features. The Dean of Westminster, who presided, mentioned that in this time of stress some of the most cherished objects that she had described had been removed to places of greater safety, and striking effigies were hidden under a veil of sandbags.

Safety of St. Paul's.

A lecture on “St. Paul's Cathedral: Its History and Preservation,” was delivered by Canon Alexander to members of the London Workers' Educational Association on Saturday at the Chapter House in St. Paul's-churchyard. Canon Alexander, speaking of the danger from fire, said that during the last three or four years inflammable material had been removed and hydrants carried right up to the Dome of the Cathedral. With the help of an electric pump, water could be got up to any part of the building and right over the cross. For the first time in the history of St. Paul's they were now in a position to deal adequately with an outbreak of fire. About half the sum of £70,000 which had been appealed for to make St. Paul's structurally safe was still wanted. The money was not being spent at all on the foundations—a problem which could only be taken in hand after the fabric had been strengthened. If they completed in the next few weeks work now going on at the south-west angle they would have got over one of the most dangerous parts of the building. He was afraid that before the work was finished it would be necessary partly to shore up the south transept to take off the weight from the top of the pier where it was much broken.

CORRESPONDENCE.

After the War! A British Empire Exhibition.

SIR,—It may be rather early to speak about after the war, but it certainly is not too early to prepare for that time. Much has already been done in the way of further developing our world-wide trade and of introducing new businesses into our midst; but still more will have to be done when peace again crowns our united efforts, if we are to still further increase and retain that trade.

Then the eyes of the whole world will be turned towards England, and then will be the time to show what we can do.

For this purpose a showroom will be needed—a showroom worthy of the country, worthy of the Empire—a showroom where our products of the past and present and our aims and intentions of the future may fittingly be exhibited. In other words, an "Empire Exhibition" will be most desirable to help in this development.

The most suitable site for such an exhibition would certainly be in London, and should be ready as soon as possible after the "Great Peace" has been declared.

The exhibition buildings should be permanent, planned and designed as one whole, in conjunction with the setting-out and arranging of the grounds.

When these buildings have served their first purpose no difficulty should be found in providing other uses for them—*e.g.*, permanent Home and Empire Exhibitions; a real Peace Palace, convalescent and rest homes for our incapacitated heroes, educational and art exhibitions, etc. Never again will such an opportunity occur, and preparations should begin at once. This is a matter of such importance that it ought not to be left entirely to private enterprise, but should be national and subsidised by the Government.

Other opinions would be of interest.

Huddersfield. VOYAGEUR.

OBITUARY.

Mr. L. Ower.

Mr. Leslie Ower, senior partner of Messrs. Leslie Ower & Allan, of Dundee, architects and civil engineers, whose death we announced in our last issue (page 282 *ante*), was a member and Past-President (1897-8) of the Dundee Institute of Architecture, Science, and Art. He was elected a Fellow of the Royal Institute of British Architects in 1890, and served as member of Council. Mr. Ower practised in Dundee for a while in partnership with Mr. C. Ower; the firm was dissolved by mutual consent in November, 1899. Messrs. C. & L. Ower won the first premium with their designs out of about seventy submitted, for the Inglis Memorial Hall, with library and parish council chamber, offices, etc., Edzell, Forfar, after the Scottish sixteenth-century manner; and they were the architects of the Bannatyne Home of Rest extension, Dundee, and also of—in Dundee—enlargement and new Board-room of the Royal Exchange and Chamber of Commerce, British Linen (branch) Bank, in West Port, premises in Bank-street for the *Dundee Advertiser* and other newspapers under that management, and Pearl Life Assurance Company's offices; alterations with repairs and improvements and vestry and session-house, C.U. Church, Coupar Angus; and they made the designs for the organ, Tayport Parish Church. Mr. Leslie Ower was the architect of Park United Presbyterian Church, Dundee, for 700 sittings in the Early English style (illustrated in the *Builder*, August 13, 1898, No. XVII. of our series, "The Architecture of Our Large Provincial Towns"); Bonnethill U.F. Church, Dundee, extension and improvements; St. Luke's Parish Church, Lockel, with church hall and other additions; and Kinnaird Hall, Y.W.C.A. extension scheme, Tay-street; and the Drill Hall for the local artillery (Territorial) forces, Dundee. Mr. Ower acted as resident architect for carrying out Messrs. Swanston & Symes's designs for the Hippodrome, Dundee.

LAW REPORTS.

KING'S BENCH DIVISION.

DIVISIONAL COURT, APRIL 10.

(Before Justices ATKIN and SANKEY.)

Blunt *v.* Tonkin:

Altering a Picture Palace.

THEIR Lordships heard an appeal by Mr. H. K. Tonkin, proprietor of the Cosy Picture Palace, Somerset-place, Teignmouth, from a judgment of Judge Lush Wilson at Newton Abbot County Court in favour of Messrs. Blunt Brothers, builders and contractors, of Teignmouth, in an action they brought against Mr. Tonkin to recover a balance of account for alterations and additions to a picture palace. There was a counterclaim by Mr. Tonkin for alleged breach of contract to do the work in question in accordance with the specifications.

Mr. R. E. Dummett appeared for the appellant, Mr. F. J. Tucker representing the builders.

Mr. Dummett said the action was brought by Messrs. Blunt Brothers upon a building contract, and there was an absolute conflict of evidence in the County Court as to what were the specifications which were binding on the parties. A question of amended specifications arose, and the grounds of appeal were that his Honour did not decide the issue in this connection, and that his general finding in favour of the builders was not justified by the evidence before him. Shortly, the facts were that in May of last year Mr. Tonkin wanted
some alterations and additions made
picture palace, and asked a Mr. Sew
friend of his at Newton Abbot, to act
architect. Mr. Sewell explained that h
assistant to Mr. Lloyd Downes, archite
Newton Abbot, and Mr. Tonkin arrang
matter with that gentleman, Mr. Sew
fact, doing the work in question.

Mr. Justice Atkin: On what point
are you appealing?

Mr. Dummett: That there was no ev
upon which his Honour could find as h
We also say he did not decide the qu
as to what specifications bound the partie

NATIONAL HOUSING AND TOWN PLANNING CONGRESS.

ATIONAL HOUSING AND WN PLANNING COUNCIL:

Housing Problems After the War.

HE Congress convened by the National Housing and Town Planning Council continued its proceedings at Caxton Hall, minster, on Wednesday, Thursday, and y of last week. On Wednesday further leration was given to the resolution moved r. Shawcross (Chairman) with reference to ning a grant of money from the Govern- for housing purposes. The resolution the meeting was :—" That this Congress the Government to re-enact the Housing Act (1914) to be placed in operation at nd of the war, and to increase the amount ded under the Act to £20,000,000." al amendments were moved to this, and ne result of consultation the following put before the meeting :—

'hat this Congress urgently directs the tion of the Government to the critical need ne provision of additional housing for the ng classes, and that, in respect of the nal interest and responsibility in the er, urges upon the Government to set not less than £20,000,000 to make such nces to local authorities as will enable to provide houses at reasonable rentals, g regard to all necessary and equitable nstances and conditions."

amendment was carried by 117 votes nety-six, and was then further amended ne insertion of the words "and other ies" after the words "advances to local rities."

Congress continued its discussion from revious day on the general question of shortage, and Mr. Councillor Myers sbury) moved :—" That in view of the s produced by the system of providing ng for the working classes hitherto pre- g, this Congress requests the Government ke such steps, either on local or national as will stimulate the activities of local rities and other agencies in the erection of ouses which are necessary."

Cheverton-Brown (Federation of House rty Owners), in seconding the amend- said they recognised there was a shortage 0,000 houses to-day, and there was a ual shortage of 100,000 a year. Although lent of a much-maligned body, he had held with the working classes being led with other than good houses; but they been saddled with the sins of those who houses a hundred years ago, and who, he sed, built them according to the require- then demanded. They could not get ouses required unless they co-operated ner and unless local authorities, utility ies, and private enterprise all sought ovide houses. Speaking with practical edge, he said the first thing to do was to e confidence in the financial market. If could show people that in investing in and mortar they would once again be ing in a sound national security, there once again be no difficulty in getting oney.

S. Smethurst (National Federation of ing Trades Employers), speaking on of the Housing Reform Association, that Association stood for a sufficient roper class of house, and they did not who provided them. If they were going ss resolutions of an extreme nature from f the divergent points of view they would wreck the whole thing. A circular had issued to the builders of the country them to assist in the movement for housing.

resolution was agreed to.

Suggested New Housing Policy.

Chairman initiated a discussion on a new g policy by explaining a Memorandum d prepared. The speaker dealt with the methods adopted in the past for providing working-class houses, and made a number of suggestions for the future. One method was for local authorities to form co-partnership schemes with tenants. He also thought local authorities should have power to lend money to public utility societies for housing, as was now done by the Public Works Loan Commissioners at ¼ per cent. more interest than they had to pay. In such cases the local authority should have power to insist on a certain quality of materials being used, on a good standard of workmanship, and on good design. He further advocated local authorities having power to advance money to builders for the erection of working-class houses on the following conditions :—" (1) The houses shall be built upon land owned by the local authority, and shall be let at a ground rent covering the cost of the land and development charges for a period of eighty years, and including sinking fund charges. The land to be laid out on town-planning lines. If at the end of this period the houses are still in good repair and fit for habitation, the owner shall have the right to lease them for a further period. It is suggested that this should be no more than twenty years at a rent based on the then price of the land. (2) The local authority should be allowed to advance 80 per cent. of the value of the house or houses as certified by their surveyor or a responsible architect, whichever is preferred by the local authority. The rate of interest charged to be ½ per cent. more than the rate the local authority pay to the Treasury or can borrow at themselves. (3) Loans to be repaid in not more than forty years by annual repayments for interest and sinking funds. (4) Houses to be built according to by-laws approved by the Local Government Board. (5) Designs to be approved by the local authority, as also the materials to be used—a good standard of workmanship to be insisted upon. (6) Stipulations to be made as to repairs being properly executed, and in case these are neglected local authorities to have power to do the same and charge to owner. The sanction of the Local Government Board to be obtained before any agreement to lend money is entered into by the local authority, as also their approval of the designs of the houses and the lay-out of the plots."

Mr. R. W. Willan (Manchester), speaking as a builder who had risen from the ranks, as had most builders in Manchester, he said, pointed out that the housing problem was purely an economic one. At the present day builders and local authorities, too, were in the hands of monopolies and trusts, and he instanced cement, which had risen 100 per cent. in price. If only the Labour leaders would meet practical builders and talk over the practical difficulties of the situation he was certain they would be able to come to an understanding.

In subsequent discussion doubt was expressed by several speakers as to whether builders would lease from local authorities and so lose their profit on the land.

No resolution was proposed.

Housing in the Mining Districts.

Dr. T. E. Hill (County Medical Officer for Durham) introduced the subject of the "Future of Housing in Mining Districts." He said the matter was not so much an economic one, because, generally speaking, the miners received a fair wage, and under normal conditions the majority were capable of paying an economic rent, and where there had been housing schemes they had shown their willingness to pay a fair rent. Miners required a large living-room, and many of the plans which had been prepared for housing schemes would not be favoured by them, as the kitchen was too small. He believed the lamentable conditions as to housing now prevailing in the Northern districts was due to the system of "free houses." When, instead of providing the house, the colliery company paid the miner an allowance, he wanted to get a house at a rent which would be covered by the allowance, and with the increased cost of building this was not possible unless he took a house with little or no conveniences. He suggested the provision of working-class houses by the local authorities, any deficiency to be met out of the rates, assisted by Government grants; the adoption of town-planning schemes in mining districts in course of development; power to the local authorities to obtain land at reasonable cost; prohibition of the erection of flats or tenement dwellings, and no dwelling to contain less than three rooms; a minimum floor space in every room; the provision of a bathroom and water-closet; the erection of lodging-houses for single men to prevent the overcrowding of dwellings.

Mr. T. H. Cann (Secretary, Durham Miners' Association) expressed the opinion that the statement on the conditions by Dr. Hill would have a great effect in the Durham mining district.

The discussion generally turned on the system of free houses, which Mr. Hogg (Northumberland Miners' Association) thought the miners would be very loath to give up, as it was an ancient privilege they clung to.

Mr. Myers (Dewsbury) hoped the experiments in the building of colliery villages in Yorkshire would not be followed, and said he noticed at the model village of Maltby one of the houses erected six years ago had fallen in, whilst the village was as congested as many an industrial area.

No resolution was moved on the subject.

Housing of the Poorest.

Mr. H. R. Aldridge (Secretary, National Housing and Town Planning Council) submitted a Memorandum on "New Developments in a National Policy in Regard to Slum Destruction, the Suppression of Overcrowding, and the Housing of the Poorest." He said the suggestions he made were admittedly drastic, but after witnessing year after year the condemnation of the slum property, which still survived, he had come to the conclusion that they needed to be scientific and to cut away remorselessly. He suggested that all those who let houses for habitation by the working classes should be required to apply to the local authority for a certificate, renewable every three years, certifying that the house was in all respects reasonably fit for habitation. At the end of five years no house in regard to which such a certificate was not possessed by the owner should be inhabited. Also a local authority should be forbidden by Act of Parliament to permit the occupation of a dwelling with an average of more than two persons to one room, or, alternatively, the occupation of any room as a sleeping-room with a less provision than 400 cubic ft. of air space per adult. He proposed the following resolution :—

"This Congress urges all parties in the State to take combined action to secure that every family shall be housed under proper conditions, and that in order to secure this end, which is of vital and national importance, legislation should be introduced—(*a*) To set up machinery in all industries to require employers to pay wages sufficient to ensure decent housing accommodation for the workers in these industries; and (*b*) to secure that where such raising of wages can only be achieved by stages the local authority shall recognise and fulfil the duty of providing decent housing accommodation for the poorest, and that the whole country shall bear the difference in the cost between the rent of the decent dwelling and the rent which the tenants can afford to pay."

Mr. B. S. Rowntree seconded the resolution, and said in connection with such a matter it was impossible to ignore the problem of the low wage. He advocated the setting up of Trades Boards to fix minimum wages in all trades.

Mr. Pearse (Nottingham) moved as a rider :—" That, in the opinion of this Congress, housing schemes promoted by public authorities, save in the case of schemes intended for housing the poorest, should be economically self-supporting."

Mr. McKellan (House Builders' Association, Manchester) seconded the rider, and described the manner in which the builder was taxed, and, he added, " then you call a conference in London and call him nasty names."

Several amendments were handed in, and eventually both the resolution and the rider were carried with the substitution in each case of the words " those unable meanwhile to pay an economic rent " for the words " the poorest."

Insanitary Rural Property.

Dr. W. G. Savage (County Medical Officer of Health, Somerset), in discussing the question of insanitary houses in rural areas, said the co-operative societies looked at the problem of rural housing and passed it by, and private enterprise did the same. He did not care whether it was the State, the municipality, or private enterprise which provided the dwellings so long as they were provided. If financial aid from the State was forthcoming to an extent which would transform the scarcely-veiled antagonism of the Rural District Councils in regard to building schemes into active and willing co-operation it should go far not only to solve the housing shortage, but the existing difficulties in the way of dealing with insanitary property.

Sir R. Winfrey, M.P., considered the Rural District Councils might be subsidised with regard to housing for a period of ten years, after which the position might be again reviewed. If the local authorities would only build ten or twenty small cottages to be inhabited by the aged inhabitants of villages, who now often occupied larger dwellings, it would go far to solve the difficulty. The experience of some half-a-dozen Rural Councils in Norfolk who had carried out housing schemes showed that it was possible to do so and let them at an economic rent.

Miss Cochrane suggested that the State should provide houses for the Old Age Pensioners, and also that Rural Councils might have the opportunity of buying the timber now being used for huts by the military at a cheap rate, to be employed in the erection of cottages.

Work of Public Utility Societies.

Mr. E. G. Culpin described the work of public utility societies, and contended that it was by means of such societies that the housing problem could best be solved. There were some sixty societies actually at work building houses, whilst sixty or seventy others had been formed with the view of getting to work at the close of the war. The great landowners of the country were showing their interest in the matter, and Lord Crewe, Lord Salisbury, and others were developing their land on these lines. The total area being developed by the societies was 1,600 acres, and about £5,000,000 was engaged to be spent on the development of land in this way. He believed this would become the most important agency for housing that they had.

Preparation of Schemes.

Arising out of a motion that the resolutions passed by the Congress should be submitted by a deputation, Mr. H. Gilbert Whyatt (Borough Engineer, Grimsby) pointed out that the deputation should make it known that the Local Government Board discouraged the preparation of schemes. If a local authority sent up a scheme it was told it had better stand over until after the war.

Mr. Aldridge said it was true that the Local Government Board would grant no loans, but he had it from the Chief of the Town-Planning Department that they were eager that local authorities should prepare schemes so that they might be proceeded with at as early a date as possible.

The Future Village.

Professor S. D. Adshead, F.R.I.B.A., taking part in a discussion on the needs of the agriculturists, said that until they got a national Road Act they would never get their communities properly connected together. They wanted a Road Board with power to plan future roads, and once having got that they could proceed to deal with the villages and open up agricultural areas which at present had no connection with suitable markets. With regard to the kind of village they would like in the future he depended very much upon public utility societies. A five-roomed cottage would necessarily have to be the standard in the future for the family, but there was still room for smaller cottages for the aged and for young married couples. Little had been said at the Congress as to the cost of building, but so far he considered they had been building with too much material and too little brains. He felt there were yet many ways in which such cottages could be produced more economically than they were producing them now, and a great deal could be done by a modification of some of the present unreasonable by-laws in rural areas. Dealing with the building up of village life in the future, the speaker described such a new community to be erected after the experimental stage was passed. He said they might suppose the site to be five miles from a railway-station and two miles from the main road, to which it was connected by a 16-ft. newly-constructed asphalt path. The land acquired might be 4,000 acres suitable for mixed farming. The 4,000 acres would be mapped out roughly into fifty or 100 farm lots, and a certain number would be again divided into 5-acre plots for intensive culture. Farm buildings and a cottage would stand on each farm, grouped around a farmyard, and the village would in its principal features be very much like what was seen to-day. There would be a church and a chapel, a public-house, a general store, a butcher's shop, a smithy, and a post-office. The difference would be seen in the result of a co-operative system that, interwoven in the social fabric of the community, had created an independence of spirit, creative ability, an interest in life, and a capacity for overcoming difficulties of organisation previously unknown. All the farm buildings and the cottages would be designed so as to incorporate in their construction standard details—doors, windows, staircases, gates, railings, etc.—which, after the most careful consideration, would be manufactured in thousands in accordance with approved designs. The materials of which the solid walls were constructed would depend upon the possibilities of the district. Where there was plenty of gravel the construction would be of concrete. In a brick district it might be cheapest to build in brick, or with a combination of brick and concrete reinforced, and in many cases buildings might be framed in steel and roofed with asbestone, permanite roofing, or wood. Small buildings constructed of almost any material would prove satisfactory, provided they stood on a concrete slab. The great feature of the cottage would be the kitchen, which would measure at least 22 ft. by 15 ft. A bath would have to be provided, perhaps of the tip-up pattern, and it could be placed in a recess or under the stairs. On clay soils the floors would be of concrete covered with linoleum, and on sandy or gravel soils the concrete would be omitted and the floors would perhaps be of wood. If the bricks were good, a 4½-in. brick or a 3-in. concrete outside wall would be perfectly satisfactory, always providing there was an inner lining to prevent damp. The inner lining could consist of coke breeze concrete slabs about an inch in thickness, leaving an air space of ½ in., and stuck to the outside wall with bits of slate and cement. Such slabs, manufactured in immense quantities and used in such a way, would make cottage building 25 per cent. cheaper. The three upper rooms would be partly in the roof and flat dormers would be bought ready-made from stock.

Homes of Married Men.

A great deal of discussion took place on the questions of the preservation of the homes of married men called to the colours and also as to finding employment for wounded men returning to civil life.

Mr. Pearse (Nottingham) protested against the attitude adopted by officials in Labour Exchanges in dealing with the applications of such men. He also considered that the making of provision for men returning from the Army and also the growing difficulty of getting domestic servants would lead to a remode of garden-city schemes. They would rec to erect buildings more in the nature of ho with one common room for meals.

Mr. Smith (Hull Master Builders' Associa said the rent of the houses occupied by called to the colours must be paid by someb and they wanted the Government to definitely that they would pay it. property-owners were men of small ca and already they were refusing to let h to men of military age.

The following resolution was passed on motion of Mr. D. Rider (War Rents Lea seconded by Mr. Whybrew (Workn National Housing Council) :—" That Congress is of opinion that the only equi way of preserving the homes of men calle the Navy and Army is by the Governm making the necessary provision out of nat revenue."

In respect to the further discussion on employment of disabled men, the follo resolution, proposed by Alderman Trou (Southport) and seconded by Mr. P (Nottingham), was carried :—" That Congress is of opinion that a national orga tion, working through committees, appoi by the local authorities, should be for to find suitable employment for dis soldiers and sailors who, when trained employment and efficient, should receive full current rate of wages paid in occupation, independent of any pension may have."

Land Settlements for Soldiers.

Mr. E. G. Culpin brought up the subje the scheme prepared by the comm appointed by the Government with regar settling disabled sailors and soldiers on land, and said that in it they had the nu of the most complete revolution the cou had ever witnessed. It contained the gern what might lead to the entire reconstructio rural life in the country. What they must at in the establishment of the proposed col was the revival of peasant art. He ho however, that the plan attached to the mittee's report showing the arrangement grouping of the new villages would no approved, because to take two miles of and dot cottages along it was not the wa make a community. Whilst he had al been opposed to some of the by-laws of districts, he thought there was danger in proposal to exempt buildings erected unde Small Holdings Act from the by-laws, becau they did that the farmer who wanted to a cottage would also want to be exempt was also proposed that the War Office sh hand over to the Board of Agriculture disused hutments for conversion into buil for small holdings. That would not be attractive picture for returning soldiers. had no objection to wooden houses, but did not want disease-carrying timber ut for providing homes for soldiers.

No resolution was moved on the matter.

Town-Planning Schemes.

Mr. George Cadbury (Birmingham) desc the town-planning schemes of his Council, particularly the South Birmingham sch which is now in course of development. paid particular attention to the questio roads, and said that in the case of the six radial roads along which trams ran or projected, and a section of the wing it was hoped the width would be 120 ft was proposed to put the service pipes u the footway, and this they considered a important development, because as roads now constructed it did not pay to break up. As regarded town planning generally hoped that a maximum of twelve hous the acre would be the standard for the futu

The Bishop of Wakefield made a spi appeal to all present to forward town plan in every way possible. He referred to apparent failure of the efforts made enlightened residents to plan the Doncaster coalfield on town-planning That district might have been made a veri Garden of Eden, but whether it was pos to save anything from the wreck now he not know. Another Yorkshire problem arising at Huddersfield. The Corporation

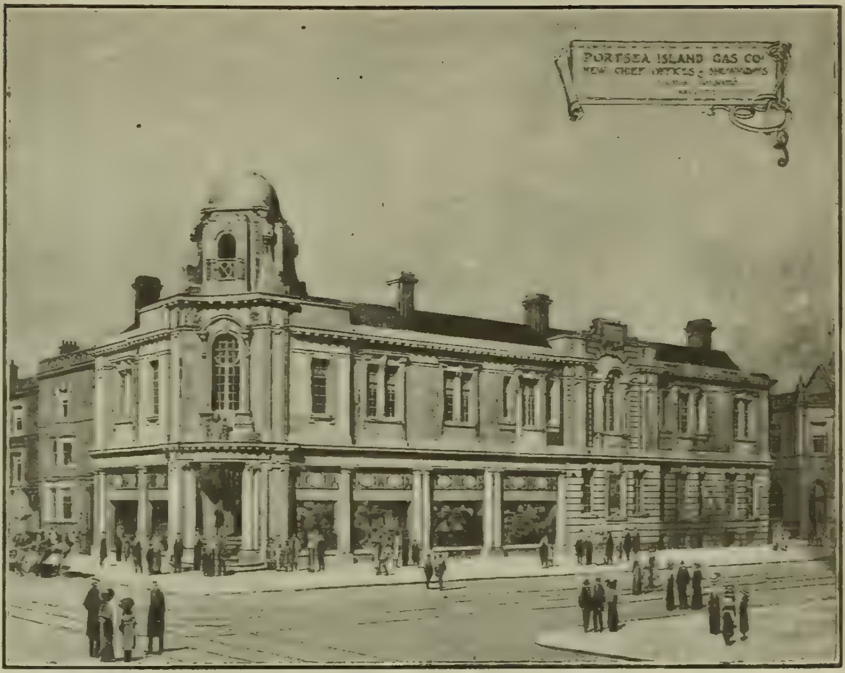
; schemes in their area."

Cheap Building Materials.

morandum by Mr. H. L. Patterson,
A. (Sheffield), was submitted on
ossibility of Adopting New and Cheap
; Materials and Securing Economy
Design of Cottages, provided that the
l Standards of good Building Construc-
. of Wholesome Environment of Dwell-
e not Impaired." The author dealt
e type of cottages generally designed
past, and in regard to the cottage of
re said they must try to get away from
rst features with as little extra cost
ble. This was by no means easy, and
ller the type of cottage the greater was
iculty. He advocated the provision
bedrooms even in the smallest cottage,
e abolition, where possible, of back
s. As far as possible there should
ssential difference in the treatment of
k and front. For nine-tenths of the
in towns brick was and must remain
the usual building material. An economy would be a modification of some of the rural by-laws as to the height of rooms. A 9-in. by 9-in. flue was ample except for the kitchen range. In walls of the dimensions of 9 in. of a height of 16 ft. or 18 ft. it might be permitted that they should go down to a concrete bed without off-sets at all. Pure bitumen sheeting was the best and cheapest material to use for damp-courses. In many by-laws the sizes of timber stipulated were needlessly large. If cheapness was desired there was no need to plaster scullery and pantry walls, but they could be pointed and whitewashed. The author discussed some of the newer methods of construction, and said it was quite possible that, used on a large scale, some of them might be more economical than the old; but a comparison of tenders actually received tended to show that for a small number of houses at least the ordinary methods to which workmen were accustomed were still the cheapest.

Time did not allow of the discussion of the subject.



Offices, Portsea Island Gas Company.

Mr. V. Wilkins, Architect.

NEW CHIEF OFFICES AND SHOWROOMS, PORTSEA ISLAND GAS COMPANY.

This building is situated in a prominent corner position on the site of the former offices of the company in the Town Hall Square at Portsmouth. The elevation is in Portland stone, and Welsh green slates are used for the roof. The basement is devoted to showrooms for gas cooking stoves, general stores, and strong-rooms. There are also rooms for the ventilating, heating, and the high-pressure gas plant. Further, there is a large cycle store, approached from the outside by a slope adjoining the staff entrance, where accommodation is provided for the bicycles belonging to the outdoor staff. The ground floor is divided into showrooms and general offices. The main entrance is approached through a circular porch on the corner.

Model rooms have been designed to exhibit the various gas appliances. All the screens, enclosures, fittings, and desks are carried out in mahogany, and the artificial lighting of the general offices is on the semi-indirect system. Situated at the rear of the general office is the staff entrance and cycle slope to basement.

The main staircase out of the showroom leads to a large square hall on the first floor. On this floor is a demonstration hall for lectures, Board-room, directors' rooms, and rooms for the general manager, secretary, and their staff. The Board-room is panelled throughout in mahogany.

The back part of the first floor, which is served by a separate staircase from the staff entrance, is planned to accommodate the automatic collectors' staff and additional offices and main staff lavatories. The caretaker's quarters are situated on the second floor.

Messrs. Sabey & Son were the general contractors. Mr. Victor Wilkins, of York-buildings, Adelphi, is the architect.

DANGEROUS STRUCTURES.

At a meeting of the Concrete Institute on March 15 Mr. W. G. Perkins, District Surveyor for Holborn, read an interesting and useful paper entitled "Some Examples of Dangerous Structures," in the course of which he said:—

"Amongst the causes of a dangerous structure are the following:—

(*a*) Faulty construction.
(*b*) Faulty materials.
(*c*) Faulty design.
(*d*) Decay and fatigue.
(*e*) Overloading.
(*f*) Removal of extraneous support.
(*g*) Wind pressure, shock, etc.
(*h*) Fire and explosion, bombs.

I propose to enumerate a number of cases where failures have resulted from one or more of these causes; generally speaking, several occur at the same time, particularly (*a*), (*b*), and (*c*).

Perhaps few of us have had any experience with failures arising from faulty design and materials in modern structures, as a sufficient period has not elapsed for time to have done its work, but there are numerous instances in buildings erected by former generations.

We moderns are often called to account for the supposed inferior manner in which we build, being told that our buildings are not solid like those erected in "the good old times," that we have lost the art of making good mortar, etc. People who make such remarks have, I fear, only an acquaintance with the jerry-builder of the very bad type. The majority of buildings erected in London 100 to 200 years ago were constructed in a most inferior manner. The mortar appears to have been compounded with a fat lime, dry slaked, and, judging from the nodules of loam it contains, mixed with a good deal of the "top spit" of the field. Naturally such stuff has, and had, no binding qualities, and to this day is only so much dusty rubbish.

The bricks were badly shaped and easily broken, so much so that in taking down old walls one finds course after course of what appeared to be headers to be only "bats." This resulted in the walls being built in a series of "half-brick" or 4½-in. skins, which sooner or later separated and bulged. If carefully examined it will be seen that many of the bricks which at first sight appear to be "headers" are too wide and really consist of portions of stretchers—*i.e.*, "bats."

Generally speaking, this bulging occurs in the basement story immediately below the level where the thickness of the wall diminishes by means of a "set-off" from one thickness to another, say 1 ft. 10½ in. to 18 in.

Sometimes large portions of brickwork roughly triangular in elevation and wedge-shaped in section burst from the walls, and when this is the case no time should be lost in needling the walls well above the point where the failure shows itself.

In many old buildings the main beams of the floors are placed diagonally, and the loads from the roof and four stories are imposed upon a pier of brickwork about 14 in. square.

Several cases I have dealt with have been party walls built with the bricks and mortar before described, about 50 ft. in height from the basement floor line to halfway up the gable. They have failed by crushing in the basement, although the load consisted of only their own weight and that of the dwelling-room floors and furniture on them. The floors have been divided into bays by beams spaced 10 ft. or 11 ft. apart. With 40 ft. in height of 14-in. work and 10 ft. of 18-in. work the weight per square foot at basement floor level from the wall itself would be per foot-run :—

40 ft. × 1 ft. 2 in. = $46\frac{2}{3}$ cubic ft.
10 ft. × 1 ft. 6 in. = 15 „

$61\frac{2}{3}$ cubic ft.

which at 112 lb. per cubic ft. = 6,867 lb. The weight of the joist and boarded floors would be 12 lb. to 15 lb. per square foot, so that we should have per foot-run of wall 4 ft. × 10 ft. × 1 ft. × 15 lb. = 600 lb.

The superimposed load on the floors cannot be stated with anything like accuracy, as it varies with the affluence of the tenant (I am speaking of dwelling-houses), but let us suppose it is as much as 56 lb. per square foot. As the roofs were very steep and covered with thick tiles which absorbed a large amount of water, and which were pointed and bedded in mortar in many cases, let us assume they also weighed 56 lb. per square foot of covered area.

This will give us per foot-run of wall four floors and one roof = 5 ft. × 10 ft. × 1 ft. × 56 lb. = 2,800 lb. Total load per foot-run, 6,867 + 600 + 2,800 = 10,267 lb.

The lower part of the wall being 18 in. thick, this gives us a pressure of $\frac{10267}{1 \cdot 5}$ = say, 6,845 lb., or a trifle over 3 tons per square foot as the ultimate load.

If 56 lb. per square foot superload on the floors is too high, then the walls have failed under a pressure of less than 3 tons per square foot. It must be remembered, however, that these walls have been standing some 200 years, and therefore the failure may be due partly to fatigue. Strangely enough, this kind of brickwork is always stronger in damp positions, the moisture having enabled the lime to a certain extent to set. Workmen refer to this state as being "waterbound."

Again, I have found a wall of this period built with two skins of brickwork, 4½ in. thick, "tied" together with wooden laths at intervals of about 18 in. in height, the space between being filled with small pieces of brick and stone.

A form of construction frequently found is a shell of 4½-in. brickwork around a stout timber post. You see the brickwork bulging and wonder why a stout-looking pier, perhaps 2½ bricks square and 8 ft. in height, should be failing under a comparatively light load. The explanation is that the timber post has decayed at its lower end and the thin shell of brickwork is unable to carry the superstructure.

A very interesting case of this kind was a building near Queen-square, Holborn. Having occasion to inspect the premises, I found the walls generally were of the kind already described and that the piers of the front external wall were yielding. The piers were cut into and, as I suspected, timber posts, rotten at the ends, were disclosed. These posts extended up to the second floor, and were quite sound in the upper parts.

Sir Francis Fox was consulted by the owners, and it was decided to grout the whole of the walls with Portland cement. Numerous small holes were cut in the interior faces just large enough to insert the nozzle of the grouting-machine. After well soaking and washing the interior of the wall with clean water under pressure from the machine, Portland cement grout was pumped in, and as it appeared at the joints and cracks it was dammed with clay stuck upon the faces of the walls by workmen watching for its appearance.

The whole of the walls were treated in this way with success. Prior to the grouting they sounded hollow, but they now sound and have every appearance of being solid. After the grouting the wooden posts were cut out of the piers and substituted by brickwork in cement.

Modern brickwork is not without its faults, due principally to the lax manner in which it is supervised and an imperfect knowledge on the part of the specification writer. He will, for instance, require that four courses shall not exceed 12 in. in height, and then select bricks that are very little less than 3 in. in thickness. The consequence is that the bricklayer, to keep to the specification, will put an insufficient bed of mortar in laying the bricks. I have had as much as 3 ft. of glazed brickwork at a time taken down because there was absolutely no mortar in any of the beds. And this was on a first-class job, under architects and a clerk of works. Again, when the bricks have a frog, that frog should be upwards when the brick is laid, otherwise the brick beds only on the rim and its bearing area is reduced by one-third. When the bricks have two frogs one should be "buttered" or filled in before laying.

Unless strictly supervised the vertical joints are never filled solid. Some mortar is rubbed over the top of the course with the flat of the trowel, which may enter the joints some ¾ in. Particularly is this the case with Staffordshire blue bricks, which are certainly difficult to make solid work with, as, using the workman's expression, they "swim all over the place."

To ensure solid work the beds should be thickly spread and the bricks pressed down into it, frogs up, and the whole course grouted up by heaping mortar on the wall and softening it with water from a "gauge-pot" so that it becomes soft enough to flow into the vertical joints until they are full.

Unless the beds and joints are full you cannot expect to get the full value out of your walls and piers, which, by the way, are always eccentrically loaded. The evil is aggravated when the wall is faced with stone, for the mason generally spreads a bed of putty, 3 in. or 4 in. wide, along the outer edges of the stone he is laying (which may be 14 in. or 18 in. on bed, such as I have lately seen), points up the back edge, and, after having poured some grout down the vertical joints, considers he has made a solid job. Have the stone taken up again and note the result. Workmanship of this sort leads to "flushing" and the fall of pieces of stone. The bed of every course of masonry should be screeded.

Many people object to slate damp-proof courses, as they become inefficient owing to the slates cracking. They only crack or crush when they have been imperfectly bedded. The usual way is to lay them on a bed of cement (perhaps containing a number of small stones) and tap them down with the trowel. This always results in the centre of the slate being unbedded. Walk along such a damp-course on your heels, and you will demonstrate to the builder in a striking manner the hollowness of his work.

Use cement made with a sand that contains no small stones, rub each slate well into its bed, and you will get a damp-proof—not a damp—course.

I am not partial to asphalt damp-proof courses unless they are of genuine asphalt.
Artificial asphalts are brittle when c
become soft in the heat of summer or
heating chamber, and squeeze out. Th
settlement, and, in the case of a reta
other wall with a lateral thrust to
may allow sliding on the bed, a resul
happened not very long ago "somev
the Midlands." Failures have occu
using unsuitable materials in the com
of concrete.

Many overhanging cornices of s
brickwork and cement have become da
through being insufficiently weighted
down.

The weight of the overhanging por
its overturning moment must be
estimated, and a sufficiently heavy
course added so as to obtain a mo
stability of at least two.

The top of the wall upon which the
rests should at the same time be well
for the cornice, though stable in itself
reason of the eccentric load it impo
the wall tend to draw it outwards.

From cement cornices the modilli
sheets of cement will fall, and I have
this to occur generally after a period of p
wet weather.

In my district there are many para
balustrades of Roman cement contai
cores which have rusted, bursting th
trades so that pieces fall on to the foot

The type of cornice and parapet mo
to fall is that occurring in a terrace c
having V-shaped roofs. There is a con
area of thin wall exposed to the weather
sides ; wet and frost soon destroy the c
properties of fat lime mortar, and
overhanging weight of the cornice, plus
a little wind pressure or vibration, b
whole lot down.

A case that frequently occurs is th
wall supported upon a beam of timbe
in turn is often carried by timber sto
In course of time these timbers bec
cayed, nearly always at the ends, and
through water gaining access.

In some premises in Holborn wher
shop front was to be inserted I found t
ends of the wooden bressummer were a
rotten for a length of 2 ft. to 3 ft.

The rainwater pipes which came d
face of the buildings had a "swa
just above the level of the shop front,
from thence downwards being reces
the face of the piers separating the
The pipes had become partially c
the swan necks and had leaked at th
this having gone on for years. Th
in consequence became rotten, and
wall had settled considerably.

It would have collapsed had it not b
small 3-in. cast-iron column in the cent
shop front, and the friction against
of adjoining premises. The only su
this column was the 4 × 3 in. rol
joist.

The condition of the front bre
caused me to inspect that which ca
main back wall. This I found to be
worse state, as the wet had been gettin
the flashings of the flat roof over
portion of the ground story. A c
defective gutter over the cornice of
front is another cause of rotten bres

To deal with these cases the wall
needled and shored, "punching up"
part of the beam before cutting any
needles, and then a new bressummer i

THE BUILDING TRADE.

CREASE OF RENT ACT.

Increase of Rent and Mortgage rest (War Restrictions) Act, which e into force on December 23, 1915, has duced some unlooked-for results, as the two actions brought by arrange- ascertain its effect, Rees *v.* The f Bute and Davies *v.* The Same.

te had put up for sale by auction cottages on leases for ninety-nine small ground rent, the tenants to es, taxes, and outgoings, to do the d keep the cottages insured. The of sale were prepared before the Act force, but the sale took place on , 1916, and at the time of the sale d Bute nor his advisers were aware would affect it. After the sale they re of the provisions of the Act, and leclined to complete until the opinion t had been taken. The action was performance. Rees, who bought cottages, was not a former tenant; was tenant of the cottage he bought. hase price of the cottages was £55 0s. respectively, and £2 10s. for and auctioneers' charges. It was at the properties were of a character e Act would apply.

stions raised were:—1. In both the purchase-money be "a fine, r other like sum in addition to the e grant of a tenancy within sect. 1 Act? 2. In the case of the pur- ant, would the transfer to him of to pay rates, taxes, repairs, and ome within sect. 1 (1) (III.) of the

ce Younger, in delivering judgment, e sales were beneficial to the tenants, on of Lord Bute in enabling persons was much appreciated in South e purchase-money and the other ould represent a less sum than the rent," but he could find nothing exclude leases for ninety-nine years tenancies within the Act, and, that e payment of the purchase-money "fine, premium, or other like sum to the rent," recoverable by the er sect. 1 (2). In these circum- refused to grant the plaintiffs formance of the contracts, and on aking of the defendant to repay e had received the actions would d.

ns being of a friendly nature the een arranged. This finding on the made it unnecessary for a decision n on the second point as to the ho was a tenant.

sue for January 21, in an article on e pointed out that in the passage hrough Parliament the Act had lost character as an emergency measure gned to prevent tenants from being areas where population was con- war purposes, and in its present Act of universal application we took o it.

udgment of the learned Judge he reat regret that he was compelled e contracts aside, but he said the led him to do so, as, although the emergency measure obviously, as dicated, passed to meet a crisis, n munition areas, the courts were o construe it as framed.

always wondered how the original f this Act came to be so entirely in the passage of the Bill through but now it is proved that in conse- ts provisions even a long lease of rties highly beneficial to the tenants ersons cannot be granted we trust nay at once be taken to amend the t it may carry out the original d nothing more.

NEW GOVERNMENT CONTRACTS.

War Office.

Stoves, etc.—Albion Iron Company (London), Ltd., Belper, Derbyshire; Callendar Iron Company, Ltd., Falkirk; Carron Company, Carron, Stirlingshire; Dobbie, Forbes, & Co., Larbert, Stirlingshire; Falkirk Iron Company, Ltd., Falkirk; S. J. & E. Fellows, Ltd., Wolverhampton; Forth and Clyde and Sunnyside Iron Companies, Ltd., Sunnyside Iron Works, Falkirk; W. N. Froy & Sons, Ltd., Brunswick Works, Hammersmith, W.; Griffiths & Browett, Ltd., Birmingham; Jones & Campbell, Ltd., Torwood Foundry, Larbert, Stirlingshire; Orme, Evans, & Co., Ltd., Wolverhampton; Richmond Gas Stove and Meter Company, Ltd., Warrington; Scottish Central Iron Company, Ltd., Falkirk; Standard Engineering Company, Ltd., Evington Valley-road, Leicester; Stirlingshire Iron and Stove Compony, Bonnybridge, Stirlingshire.

Works Service.—Drainage, etc., at Newmarket: H. E. Ambrose, Gwydir-street, Cambridge; electric lighting at officers' mess, etc., at Dover: V. G. Middleton, Broadway-chambers, Westminster, S.W.; electric lighting at Portland: G. E. Taylor & Co., 7, Suffolk-lane, E.C.; filter beds, drains, etc., at Dreghorn: J. Scott & Brown, 3, Barclay-place, Edinburgh; sewage pumping plant at South Farnborough; Burn Bros., 3, Blackfriars-road, S.E.; work at smithy and foundry at South Farnborough: Crosley & Co., Ltd., South-street, Farnham.

Maintenance of Camps and W.D. Buildings at Shirehampton and Avonmouth.—G. Pollard & Co., Ltd., Wood-street, Taunton.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—At a recent meeting of the Aberdeen Harbour Board the Lands and Fishings Committee reported on the proposed extension of ground at Torry as the site for a shipbuilding yard, for Messrs. John Lewis & Sons, Ltd. The new plan implies the alteration of the line of South Esplanade East, and the area leased to the firm will be increased from 7,018 to 9,600 yds. The report was adopted.

Auckland.—The Plans Committee of the U.D.C. has considered a plan for a proposed garage for the United Automobile Services, Ltd.

Bournemouth.—The Tramways Committee of Bournemouth B.C. is arranging for the immediate erection of a tramways shelter at Poole Terminus. The L.G.B has sanctioned the raising by the B.C. of the sum of £1,000 for cliff protection works. Subject to the consent of the Board of Trade, the B.C. has decided to construct groynes at Undercliff-drive. The Borough Engineer has been instructed to erect refreshment-rooms at foot of East Cliff Lift and at Fisherman's-walk. The following plans have been approved by the Buildings Committee:—New deposits—House, plot 16, St. Alban's-avenue, Mr. E. A. Insley; billiard-room, etc., "Chislehurst," Marlborough-road, Mr. J. A. Longden; house, plot 221, Dunbar-road, Mr. H. Long. Additions, plot 6B, Pine-avenue, Messrs. Burridge & Bovill; additions, "Braemar," Alumhurst-road, Mr. J. R. Tile; covered way, "Attleboro'," Wentworth-avenue, Mr. J. Newbury; house, plot 49, St. Alban's-avenue, Mr. W. King; house, site 33, St. Luke's-road, Messrs. George & Harding; house, corner Glen and Wilfred roads, Mr. C. T. Miles; house, plot 219, Dunbar-road, Mr. E. A. Insley; house, plot 22, Spurgeon-road, Mr. W. E. Bailey; alterations and additions, "Connemarra," Knole-road, Mrs. E. E. Hazard. Re-deposit—Amended plan, winter garden on flat, Old Christchurch-road, Messrs. Plummer Roddis, Ltd.

Bradford.—The Bradford Empire will shortly be closed for alterations and redecorations.

Bristol.—The Docks Committee has granted permission to Mr. S. J. King, acting on behalf of the Cartowners' Association and the Dockers' Union, to erect a shelter for trace horses and their attendants on the quay near Bristol Bridge.

Burryport.—The Council has passed plans of six new houses and one shop near the Derwydd, for Mr. Billings, Swansea.

California.—The Scottish Rite Masons of Sacramento, California, have passed plans for the erection of a temple which will be used exclusively by Scottish Rite Masons, the building of which is to cost £16,000.

Chelmsford.—It was announced at a recent meeting of the Chelmsford R.D.C. that alterations and improvements are to be carired out at Ingatestone Old Post Office.

Crook.—A new surface water drain is to be laid at Woolley-terrace at an estimated cost of £60.

Croydon.—At a recent meeting of the Croydon T.C. the Borough Engineer reported with regard to the Beulah Hill Town-planning Scheme that he had interviewed the principal owners and had prepared draft of a scheme and map which he submitted.

Derby.—The T.C. is to construct a sewer from Osmaston Park-road to the main intercepting sewer, part of which will pass through the Merrils Farm, in order to develop the land acquired by the Corporation.

Dorchester.—The T.C. has approved plans submitted by Messrs. John Groves & Sons, of Weymouth, of proposed alterations to stable and cart-house to the Phœnix, High East-street, and on behalf of Mr. T. Lynes by Mr. F. T. Maltby of proposed alterations to stables in Princes-street to turn them into motor garages.

Dumbarton.—The Western District Committee of the Dumbarton C.C. recently considered a report from a sub-committee on the housing question. It was decided to continue the remit to the sub-committee to enable it to obtain a report upon sites, plans of buildings, estimates, etc.

Dundee.—Dundee Harbour Trustees have had before them a proposal by the Caledon Shipbuilding and Engineering Company, Ltd., for a large extension of their shipyard.

Durham.—Funds are being raised for renovation purposes at the Bethel Chapel, North-road, Durham.

Ely.—The U.D.C. has approved plans, submitted on behalf of the Shell Marketing Company, for a combined office and pumphouse on the premises of the G.E.R. station; also plans of a motor garage, for Mr. H. Downie, and house in Barton-road, for Mr. B. J. Gentry.

Fochaber.—Tenders have been accepted for the erection of a jam factory for Mr Baxter, merchant, Fochaber. The architect is Mr. John Willet, Elgin.

Folkestone.—The T.C. has approved of the following:—Plans, submitted by Messrs. Barr & Egbert (owners) (Mr. F. J. Cox, architect, Messrs. W. Silk & Son, builders) for a temporary hippodrome at the rear of Linden-creecent, as a temporary building; plans submitted by Mr. F. Nicholls (owner, architect, and builder) for additions to 86, Shorncliffe-road. The Council has deferred consideration of the plans submitted by Messrs. Youngs & Old (owners), Mr. A. R. Bowles (architect) for additions to garage, Cheriton-road; also plans submitted by the Central Picture Theatre, Ltd. (owners), Mr. J. Vant (architect), for additions to the Central Picture Theatre, George-lane.

Grantham.—The T.C. has approved plan for the reconstruction of a warehouse at Earlsfields Works, for Messrs. A. & J. Shaw, Ltd.

Hayes.—The U.D.C. has received tenders for the Botwell housing scheme, which have been forwarded to the L.G.B.

Hebburn.—It has been decided to rebuild the Hebburn Colliery Workmen's Social Club. Plans, which have been prepared by Mr. G. R. Smith, architect, South Shields, have been approved by the Hebburn U.D.C

Hexham.—The following plans have been passed by the R.D.C.:—Plans for semi-detached house and shop at Allen View, Catton, for Mr. Geo. Newman, builder; and plans for a new wash-house, and alterations to out-offices, at Barrasford, for the Duke of Northumberland.

Horbury.—At a recent meeting of the D.C. plans were approved for the erection of two cottages in Rayner-street, for Mr. J. Dyson; a transformer shed at Millfield Mills, Horbury Junction, for Messrs. Archer, Ritchie, & Co., Ltd.; and a wooden stable in New-street, for Mr. A. Kershaw.

Huddersfield.—At a conference of delegates of the Huddersfield Trades and Labour Council held recently, the following resolution was carried:—"That the Huddersfield County Borough Council be requested to take steps immediately to build at least 1,000 houses in order to meet some of the requirements of the borough. The houses to be built by a special rate levied for that purpose, and to be built by direct labour, under the supervision of the Borough Engineer."

---

* See also our list of Competitions, Contracts, etc., on page 306.

India.—The Sargodha Municipality has submitted to the Punjab Government an application for a loan for the extension of the Sargodha water supply scheme.

Irvine.—Irvine Dean of Guild Court has passed the following plans:—The British Phenoloids Company, for the extension of works at Gailes-road; the Standard Chemical Products Company, Ltd., to erect a crystallising house and store at their works at Boatstobs; the Hosiery Manufacturing Company, Ltd., to erect dining and cloakrooms for employees. Applications by the Scottish Kinemas, Ltd., to erect a picture house, and by Messrs. A. Cunningham, Ltd., to erect a hosiery factory, were continued.

Kirkby.—The U.D.C. has passed plan submitted by Mr. J. Stowe, of two dwelling-houses in Beulah-road.

London.—Plans have been sanctioned for alterations at the Cambridge, Cambridge-circus; Waterloo Coffee House, Haymarket; and the licensed premises, 60, Wardour-street. The justices have sanctioned plans as to certain alterations to the following houses:—Ancient Foresters beerhouse, 282, Southwark Park-road, Rotherhithe, Mrs. Mary Coombs (widow), licensee; Railway Station, Waterloo-road, Lambeth, Mr. E. F. Bugler, secretary. The following cases of proposed alterations to the undermentioned houses were adjourned for a committee of the justices to view premises:—Morning Star, beerhouse, 231, Rye-lane, Camberwell, and the beer, wines, and spirits off-licensed premises, 691, Old Kent-road, Camberwell. The Westminster City Council has had before it a notification from the L.C.C. of an application by Mr. E. Fisher, architect, for consent to a building for the Royal Geographical Society at the corner of Exhibition-road and Kensington-gore. The Royal Free Hospital in Gray's Inn-road has received an anonymous gift of nearly an acre of land, which will be available for an extension of the hospital particularly needed in connection with maternity work and infant welfare. The Licensing Justices have sanctioned plans of alterations intended to be carired out at the Jolly Anglers, 227, Kentish Town-road—licensee, Mr. Harry Rolles.

Lowestoft.—The T.C. has decided to make application to the L.G.B. for sanction to borrow £16,500 to carry out necessary works of reconstruction for foreshore protection, etc., at the North and South Beaches.

Newcastle.—A proposal has been submitted to the City Council for the leasing for ninety-nine years of the Singleton House site in Northumberland-road for the erection of a large building.

Oldbury.—The Public Works and Buildings Committee of the U.D.C. has recommended that the following building plans be passed:—Rev. E. Cato, extensions to chapel, Parsonage-street; Messrs. Accles & Pollock, sixty-four houses, New-street, Rood End; Mr. George Alexander, factory, Rood End-road.

Oswestry.—At a recent meeting of the T.C. the General Purposes Committee recommended that permission be granted to Messrs. E. J. Gittins, Ltd., to erect eight temporary buildings at the rear of their premises in Church-street to be used as motor houses, and that the plan for the erection of house and buildings in Welsh Walls, for Mr. J. E. Morgan Jones, be approved.

Peterhead.—At a recent meeting of Peterhead T.C. a petition and relative plan was submitted by Mr. William and Mrs. Buchan, 19, Ronheads, for warrant to alter the dwelling-house there.

Peebles.—The Perthshire branch of the Scottish Veterans' Garden City Association for the erection of cottages has received £300 from Mrs. Ainslie, Peebles, who wishes this sum to be utilised in the erection of a cottage, to be named the "Charles Alexander Ainslie Cottage."

Perth.—The L.G.B. recently asked Perth T.C. to consider reports regarding the proposed new water supply for the city. The Special Water Committee is inquiring if the L.G.B. would approve of a scheme in which the crude water would be drawn from the River Tay, and has informed them that the Committee has under consideration the question of a subsidiary water supply from artesian wells.

Poole.—The Commissioners of the Harbour Board have approved a scheme of the Corporation to construct a viaduct for carrying water-mains across Holes Bay in the vicinity of Creekmoor Bridge.

Portugal.—A Bill has been presented to the Chamber of Deputies to authorise the Municipality of Sobral de Monte Agraço to sell certain property, with a view to devoting the proceeds to the construction of a municipal slaughter-house, and also, should there be any surplus, a school building.

Ramsgate.—The T.C. has approved the following plans:—For the erection of a shop at No. 13, High-street, owner, Mr. Norman Reeve; for the erection of two houses, Dumpton Park-drive, owner, Mr. W. W. Martin.

St. Helens.—At a recent meeting of the T.C. a letter was submitted from the London and North-Western Railway Company stating that the Refractory Zinc Ore Treatment Company, Ltd., require a site for a new works.

Spain.—The *Gaceta* of March 23 contains a call for tenders by the "Dirección General de Prisiones" for the construction of cells, sick rooms, and four workshops in the centra
of the port of Santa María (Cadiz). T
mated cost of the works is 647,860 peseta
£26,000).

Wallsend.—At a recent meeting of
T.C. the Town Clerk and Borough Surve
instructed to go into the question of p
a town-planning scheme for the eastern
of the borough, and the Town-Planni
mittee reported that the line of the
through road from Newcastle to Tynem
meeting with the approval of the majori
authorities interested.

Wareham.—The T.C. has conside
estimate from the Surveyor, amounting
for the repair of the road from the top
street to the Union, and the work is ex
be commenced shortly.

Wellington.—At a recent meeting of
plans and estimates for proposed alter
buildings were submitted by Mr. Flemi
tect), amounting to £665. These are to
to the L.G.B. for approval.

Yiewsley.—The U.D.C. has approved
new stables at the rear of York-plac
street.

BUILDING AND FURNISHING MATERIAL WORKS, SPAIN.

The *Gaceta de Madrid* of March 31
the text of a Royal Decree grantin
ordinary credits in favour of certain
Government Departments, as follows

Ministry of War.—Barrack cons
and improvement works, etc., 500,000

Home Office.—Works in the National
of Hygiene of Alfonso XIII., 300,000
works in the Cancer Institute, 50,000
works in the Mahon Hospital, 150,000

Ministry of Public Instruction a
Arts.—Advances to municipalities for
struction of new schools, 600,000
extension and improvement works in
under the control of the Ministry,
pesetas.

Ministry of Fomento.—Road cons
works, 3,000,000 pesetas; new road cons
1,000,000 pesetas; road repair works,
pesetas; construction of agricultural en
school 500,000 pesetas. (25 pesetas = a

* War bonus of 2s. per week granted. † War bonus of 3s. per week granted.

THE SURVEYORS' INSTITUTION:

TOWN PLANNING.

IN our last issue we gave the first part of a paper read by Mr. W. R. Davidge at the Surveyors' Institution on the 10th inst., entitled "The Principles and Position of Town Planning." We now give a further part of this interesting lecture.

Zone System and Commercial Districts.

"The division of a district into building zones in which different building regulations apply has not found favour in English practice, although separate districts for buildings of the warehouse or factory class have been adopted at both Ruislip and Birmingham.

From the point of view of protection of property-owners in residential districts, some form of restraint as to the location of commercial buildings is clearly necessary, and, so far as the Act has gone, the constitution of separate areas for factory and commercial purposes has been carried out without difficulty.

As so many of us are aware, however, the real test of such restrictions will be felt in the next generation. With the continual growth and prosperity of a town the commercial area will surely expand, and unless adjacent space is provided for expansion the business side of the town will necessarily overflow into the residential quarters. In all old centres this alteration of use is continually before our eyes. In New York, within the last few years, business which formerly was done in Twenty-third-street has now moved up as far as Forty-second-street, and an entirely new shopping district created.

Even in London the one-time quiet residential Hanover-square is rapidly assuming a commercial character, and the once peaceful quiet of Soho-square has long been broken into by the pickle factory. Such changes are in the nature of things, and, however hard and fast the restrictions of a town-planning scheme may be drawn, it is evident that unless the plan itself also provides for extension mere legal restrictions will have no more force than the out-of-date paper restrictions of many one-time high-class residential estates, more honoured in the breach than in the observance.

Provision must therefore be made for the gradual expansion of commercial districts.

The phenomenon of the overflowing of business into the residential areas of a town is constantly before our eyes, but it is curious to note that in nearly all towns, no matter how old, the heart of the business community still has its nucleus in the area of the original settlement. No matter how Oxford-street or Kensington High-street may flourish, the City of London still holds its own so far as the business community is concerned. The same is true of New York, where the nerve centre is still in the original commercial settlement at one time bounded by Wall-street.

Increased Height of Business Premises

It is the endeavour to crowd as many office buildings as possible near this commercial centre that has created the "skyscrapers" of Lower New York. This tendency towards increased height of buildings in commercial centres is equally noticeable in such cities as Sydney, Melbourne, Winnipeg, Vancouver, and even in comparatively small cities like Regina. *There is everywhere a tendency to increased height of business premises.*

Control of Building Heights.

The New York authorities have given much consideration to the important question of regulating the height of buildings. In Lower Manhattan there has for many years been a growing tendency towards the erection of tall "skyscrapers," mostly office buildings. The excuse for this has been the limited area available in the older commercial quarter of the city, but the real purpose has in many cases probably been for advertisement purposes. The Woolworth Building at present easily holds the record. When I visited the Woolworth Building I entered the lift, and was carried up by express "elevator" to the fifty-first story. Then I changed lifts and went up another four stories—fifty-five stories in all. As an investment, however, hardly any of these tall buildings pay. Such buildings, too, only add to the existing congestion, and, to emphasise this point, it is stated that if the 10,000 occupants of the Woolworth Building all left off work to go home at one time by the nearest electric railway it would take the railway's full capacity for twenty-two minutes to get them all away—and this from only one building. The City of New York is already spending some £73,000,000 in the construction of electric subways, and in the interests both of economy and public health the city has now decided to discourage the erection of buildings above a reasonable height.

In this connection the Report of the Heights of Buildings Commission for New York City gives some interesting information, proving conclusively that the very tall building is not a paying proposition:—

"The cost per cube foot for a skyscraper is given as 2s. 6d. to 3s. 1½d. (60 to 75 cents), as compared with 1s. 8d. to 2s. 1d. (40 to 50 cents) per cube foot for a low building of the same class. The loss of space on the ground floor taken up by the thirty or so lifts, and as much more for the necessary lobbies, is even more serious. Ground floor space in such buildings often rents at £4 per square foot ($20), and the loss of something like 4,000 sq. ft. of floor space means an annual loss of £16,000 on this floor alone. A ten-story building would save two-thirds of this. The loss on the upper floors, due to the space taken up by lifts, etc., also amounts to a surprising total. This means that tall buildings reach a limit beyond which the loss in space on the lower floors more than counterbalances the profit on the upper floors. Every building, according to its shape, size, location, and use, has its economic limit.

Even though a high building may pay a moderate return as long as it stands alone, and is surrounded only by low buildings, so that all its floors are light and attractive, the result is bound to be very different after it is surrounded by similar buildings, shutting off light and reducing rentals on the lower floors."

In the interests of traffic facilities, public health, and public economy the height of buildings should be kept within reasonable limits.

It is interesting to note, however, that even in Central New York (Manhattan) the average building height is still only 4·8 stories. The buildings over ten stories constitute only 1·11 per cent. of the total. Out of 92,749 buildings in Manhattan there are only 1,048 buildings over ten stories in height; ninety buildings over seventeen stories in height; fifty-one buildings over twenty stories in height; nine buildings over thirty stories in height.

Limits of Height.

The *limits of height of buildings* in various cities are at present as under:—

London.—80 ft.

Paris.—In streets less than 40 ft. wide, street width + 20 ft. In streets over 40 ft. wide, 58·64 ft. + ¼ (width — 40 ft.).

Berlin.—Maximum 72·2 ft. (22 mètres).

Boston.—District A, 125 ft., or 2½ times width of street. District B, 100 ft., or 1¼ times width of street. (Buildings over 80 ft. only allowed on streets over 64 ft. wide.) Special restriction to 70 ft. on blocks adjoining State House.

Washington.—Pennsylvania-avenue.—160 ft.; other business streets, 130 ft., or street width + 20 ft.; residence streets, 85 ft.; or streets over 70 ft. wide, street width — 10 ft.; streets 60 ft. to 70 ft., 60 ft.; streets less than 60 ft., street width.

Other American Cities.—Baltimore, 175 ft.; Chicago, 200 ft.; Los Angeles, 150 ft.; Salt Lake City, 125 ft.; Toronto, 130 ft.

New York.—Limit of height of apartment and tenement houes, 1½ times street width.

The New York Commission recommend the limit of height for all buildings within 100 ft. of Fifth Avenue to be 125 ft., and that the general restriction for residential districts should be 1½ times street width, *i.e.*, for 60-ft. streets height would be 90 ft., and for business streets 2 times street width with maximum of 300 ft. A number of American cities, including Baltimore, Milwaukee, Minneapolis, and Los Angeles, have in recent years established separate residential and industrial districts.

Limitation of Houses per Acre.

In England, although land values in
towns have reached a considerable he
there has been no great demand for ver
buildings, and it is probable that the pr
height limits, where established, are suffi
to check this tendency. The limitation o
number of houses per acre has, however,
enthusiastically taken up in this country.
effect of such a limitation must be at least
fold. It tends first to spread the town,
consequently the values, over a larger area
by restricting the use to which land is put
to that extent decrease the value per ac
land which is already ripe for building.
the same time it will tend to give a corres
ing increase of value to land further fron
town. Its effect on the already over
city areas cannot fail to be beneficial. fo
fixing a standard of suburban developm
a high standard of amenity and a comparat
low standard of price—it will be finan
impracticable to force up values in the bu
areas above a reasonable limit, and fo
same reason it will not pay to unduly inc
the congestion of building. The diffic
of fixing a suitable "land unit" are, how
considerable, and both the Ruislip and Bir
ham systems are worthy of study in this re

Twelve houses to the acre is a reaso
maximum, but where land is already

the causes which operate to bring about
prosperity are deep set in the natural, geogr
cal, and strategical position of the town.

Private residents will not be attracted
town which is a blot on the landscape,
businesses will not come unless there is bus
to be done. Any town plan, therefore, fo
development of a town must *aim first at m*
the utmost of all such natural and geogra
advantages, and then at guiding the develop
into the most advantageous lines for the bene
the town and its residents.

Transit Facilities.

The provision of efficient and up-to
means of transit is one of the most impo
items in the development of towns; yet, st
as it may appear, this all essential det
omitted from the calculations of many wou
town-planners.

On more than one occasion during my r
visit to the Colonies I was asked to advise
the lay-out of estates or townships many

m any existing community, with no
aison d'être of their own, and which
rdly any circumstances could become
orting and self-contained. It is evi-
t, *in the absence of any special com-*
r natural advantages, or of facilities for
mmunication with existing centres, a
y cannot expect development.
t not be thought from this that any
rden cities" cannot be created, but
only be successfully created if they
re enough commerce or industry to
m self-supporting, or if they are linked
isting communities by easy and rapid
f some description, so that the new
ty can serve either as a branch industry
alth resort or dormitory to one or more
owns. *Rapid transit, therefore, is all-*
to the success of any town
erica, where distances are so immense,
sit question inevitably bulks largely,
ially in recent years American towns
en more and more attention to the
of the quick distribution of passengers
outlying districts to and from the
business portions of a town.
d transit" is therefore one of the
iderations of our American cousins in
ng the problem of town development,
indeed strange that we in this country
dimly beginning to realise this in our
after new and improved arterial roads.
ds and motor traffic are, however, only
of the problem, and in America many
re giving their attention to the solution
nsit problem as a whole."

Rapid Transit.

the most useful investigations in this
and one which has been of great
an example to other towns, was that
the Philadelphia Transit Commissioner
nd his report gives a most exhaustive
prehensive survey of the transit pro-
far as Philadelphia is concerned.
tudy has been given to the transit
in the United States generally, and
of its effect on town development.
aturally found that property in the
hood of a "rapid transit line"
more rapidly than other parts of the
d if only one such line exists it will
absorb the greater part of the normal
the town.
uestion of the amount of traffic to
e construction of a tube railway or
subway will depend upon local
cal and commercial conditions, but
rious fact that, so far as this country
ned, no town with a population of
half a million has ventured to introduce
lway or electric "rapid transit" line.
ious parts of the Continent there have
ing for some years now a combination
c light railway and tramway which
e far-reaching results. Many of these
ently ordinary tramcars and trailers
they are in the town, but as soon as
h the outskirts they travel on a special
heir own. With stops five miles or so
average speed of upwards of thirty
hour is easily obtained. This system
dy proved of great value in bringing
s and country produce into the cities,
d be of great service in distributing
ns if its use were more widely practised.
on special tracks of this description
seen in the outskirts of Sydney, and
urse, in many parts of Holland, though
hese cases the stops are too frequent
the full use of rapid transit facilities.
concise and comprehensive report on
assenger Transportation Problem"
cently issued by the General Manager
anchester Corporation Tramways, and
excellent summary of what has so far
eved in this direction in America and
ipal cities of the Continent.
is, however, still a wide field for
ion as to the methods of transit most
or particular localities, and it is clearly
ble to do more than generalise one or
iples upon which most authorities are
-

tric "subways" or *tube railways can*
y be commercially successful where the traffic is large and constant. Sub-surface railways are therefore only suitable for communities with a population of over half a million or more. Overhead railways are almost equally costly as tubes, and by reason of their noise and ugliness are generally regarded as unsuitable to English conditions.

(2) *Tramways and motor omnibuses are of more service when run in conjunction with rapid transit lines.* In Boston, U.S.A., tramway subways, somewhat similar to that under Kingsway, have been in operation for some years, but, owing to its narrow streets and congested site, the problem in Boston is a very special one.

(3) *Special tracks should, if possible, be provided for tramways,* particularly outside the built-up areas. Special tramway tracks on wooden sleepers laid in grass have been very successful in many parts of the Continent, and they are now being introduced in the new arterial roads recently constructed in the outskirts of Liverpool.

Arterial Roads.

For many people town planning begins and ends with the planning of roads, and there can be no gainsaying that the main roads into and out of a town are the skeleton on which the plan will hang together. They may, in some instances, be the "bones of contention," but all will be in agreement with the general principle of fixing the routes needed for new main roads, including, of course, reasonable circumferential and cross-roads. *The routes for arterial roads should be laid down at an early stage in the town plan, and definitely secured or sterilised from other uses.*

It is remarkable how many of our large towns are now considering this problem of arterial roads. There is evident, too, in this country a tendency towards "circular roads" in addition to radial routes, which, however, must always take the bulk of the traffic. Liverpool has already constructed a fine circumferential boulevard. Birmingham has prepared a scheme showing a circumferential road 100 ft. wide practically encircling the city. The London Traffic Branch of the Board of Trade has also given very considerable attention to this matter, and the conferences of municipal authorities in Greater London have, with the assistance of this Institution and other professional bodies, at last agreed upon a comprehensive scheme of main arterial and circumferential roads for Greater London, the total length of the proposed roads approximating a hundred miles. The financing of the proposals where so many authorities are concerned is, however, a difficult matter, and the signs all seem to point to the necessity for making main roads a national matter. In most other countries "*routes nationales*" have long been an accomplished fact, and the importance of the national point of view must not be lost sight of.

The Road Board established by the Government for this purpose is a recognition of this principle, and it is to be hoped that in the stress of these stormy times the principle of national responsibility for the "King's highway" will continue to be maintained. *Main roads are the property of the nation and should be a national matter.*

Roads and Road Widths.

Much discussion and many conferences during the past six years have taken place on the question of road widths and construction, especially perhaps as to the allocation of space for various classes of traffic.

The general principles arrived at may, I think, be reasonably summarised as follows:—

To secure easy and rapid transit—

(1) *Classification of roads is desirable.*
(2) *Provision for fast and slow traffic (fast traffic should not have to slow up for cross-traffic), and separate tracks for tramways.*
(3) *Sufficient width of roadway for the traffic, but not too wide to be maintained.*
(4) *Sufficient width between buildings for all future purposes.*

To secure the amenity of the highway—

(1) Good views from the road—preserving view points.
(2) Good views of the road—trees, but not too thickly planted.
(3) Pleasant walks alongside the road—grass and trees where possible.
(4) Pleasant halts by the way—an occasional village green or open space.

It should be borne in mind that *estate development is not necessarily an object of main roads.*

And in the lay-out of estates the principles laid down in my paper at this Institution six years ago still hold good, viz.:—

(1) Main routes must take the direction required by the traffic and contour of the ground.
(2) Geometrical planning is not necessarily satisfactory.
(3) Long straight streets, when adopted, should have a definite motive.
(4) Slight curves or irregularities in frontage lines and building lines may often be adopted with advantage.
(5) Line of sight should in most cases be restricted within reasonable limits.

Relaxation of By-laws.

A very important point on which most people are now agreed is, that, *while it is desirable to have a minimum distance between the building lines, a hard-and-fast by-law width is undesirable* whether it be 40 ft. or 50 ft. (or 66 ft. as in the Colonies).

The power to fix building lines is important.

The width of macadam or roadway paving provided should be dictated by the use to which the street is put.

In residential streets the remaining width available may reasonably be devoted to grass margins and tree planting.

The *relaxation of by-laws,* allowed by the Act to be introduced into town-planning schemes, may also in some cases be usefully applied to the by-laws dealing with buildings. The by-law, for instance, requiring party-walls to be carried above the roof, might in most cases reasonably be waived, and there is also something to be said for the suggestion that in country districts wooden buildings might be permitted subject to reasonable restrictions Even under the London Building Act it is possible to build a wooden house provided it is 30 ft. from the adjoining property or any other building, and it should be at least possible to do the same in the country.

Internal Improvements.

For some years now it has been felt *that there should be some means of extending the principles of the Town Planning Act to the internal or built-up area of towns,* but many difficulties confront us in this direction, and it is probable that for some years to come internal street improvements will have to be the subject of special enactment in each case.

Some extension to the whole country of the principles of the Metropolitan Paving Act, 1817 (*Michael Angelo Taylor's Act*), by which local authorities in London can by simple resolution purchase land for street improvement, *would undoubtedly greatly simplify the procedure of local authorities.*

Compulsory Town Planning.

Another point which has been much discussed is as to the desirability or possibility of making town planning compulsory, and it is probable that all will be agreed that *the time has not yet come for compulsory town planning.*

In Massachusetts and other States the appointment of a town-planning board is compulsory for all towns with a population of over 10,000. In Canada the Nova Scotia Town Planning Act, passed in April, 1915, makes town planning compulsory for the whole of Nova Scotia, and this experiment will be watched with interest.

Progress in the Colonies and India.

The other Canadian Provinces which have adopted special town planning Acts are New Brunswick and Alberta in 1912. It is probable that the remaining provinces will shortly follow suit, and the same may be said of the various Australian States and the New Zealand Government. In India the Bombay Government has already led the way in this respect.

(*To be continued.*)

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk** (*) **advertised in this number**: Competitions, —; Contracts, —; Public Appointments, —; Auction Sales, xvi. Cer conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those wi to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while e endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

April 20.—**Walker-on-Tyne.**—Painting.—The Walker Co-operative Society, Ltd., Lamb-street, Walker-on-Tyne, invite tenders for the painting of the Society's business premises and dwelling-house property situate in Lamb-street and Wharrier-street, Walker; also their business premises and dwelling-house property situate in Welbeck-road. Specifications, etc., at the office, Lamb-street, Walker.

April 21.—**Huntingdon.**—Wall.—For the re-building of a wall at the Huntingdon Workhouse. Particulars from the Master.

April 22.—**Lowca.**—Houses.—For the erection of two dwelling-houses in Stamford Hill-avenue, Lowca, for the Harrington Coke Ovens Company, Ltd. Plans and specifications can be seen at the office of Mr. Charles W. Eaglesfield, architect and surveyor, Gordon-street, Workington.

April 22.—**Wexford.**—Cottages.—For building nine single labourers' cottages for the R.D.C. Particulars of the Council's Engineers, Messrs. Donnelly & Moore, 36, Nassau-street, Dublin, or of Mr. Nicholas Kehoe, Clerk of Council.

April 27.—**Navan (Co. Meath).**—Converting.—For converting the military barracks at Navan, Co. Meath, into a school and residence for the De La Salle Brothers. Plans, etc., can be seen at the Presbytery, Navan, with the Administrator, the Rev. J. J. Poland, or at the office of Messrs. William H. Byrne & Sons, architects, 20, Suffolk-street, Dublin.

April 28.—**Abersychan.**—Garage, etc.—For the erection of a garage and stables situated in "Steep Field," Abersychan, near Pontypool, for the Abersychan Co-operative Society, Ltd. Plans, etc., of Mr. C. F. J. Wilton, architect and surveyor, Midland Bank-chambers, Pontypool.

May 1.—**Cwm.**—House.—For the erection of caretaker's house at Duffryn Schools, Cwm, for the Ebbw Vale E.C. Plans, etc., on payment of £1 deposit in P.O.'s, of Mr. T. J. Thomas, the Town Surveyor.

May 1.—**Wigan.**—Extensions.—For an extension of the Market Hall. Specification, etc., of Mr. A. T. Gooseman, Borough Engineer, King-street West, Wigan.

May 2.—**Bradford.**—Plumbing.—The Bradford Corporation invite tenders for plumbers' work required in the erection of sanatorium buildings at Grassington. General conditions of contract, etc., of the City Architect, Town Hall, Bradford.

May 4.—**Langley Moor.**—Cemetery Extensions.—For the construction of boundary walls, iron railing, drainage, and road-making in connection with Waterhouses Cemetery, for the Brandon and Byshottles U.D.C. Particulars of Mr. Geo. G. Donkin, Surveyor, Langley Moor.

FURNITURE, MATERIALS, etc.

April 20.—**Govan.**—Materials.—Supply to the Govan Combination P.C. and Govan District Board of Control of builders' materials, etc. Forms of tender, etc., of the Subscriber, Mr. John Mitchell, Inspector and Clerk, 7-8, Carlton-place, Glasgow.

April 24.—**Lochgilphead.**—Paints, etc.—Supply to the Argyll and Bute Asylum, Lochgilphead, for twelve months from May 15, 1916, of paints and oils, timbers, etc. Schedules to be had on application.

April 26.—**Cork.**—Paints, etc.—Supply to the Cork Harbour Commissioners of paints and oils, nails, screws, and files. Forms at the Engineer's Department, Harbour Commissioners' Offices, Custom House-street, Cork.

April 29.—**Glasgow.**—Materials.—Supply to the Corporation Hospitals Department of plumber, engineer, and joiner materials. Forms of specifications from the House Steward at the Hospital, Belvidere, London-road

ENGINEERING, IRON, AND STEEL.

April 21.—**Dundee.**—Steel Work.—For the execution of steel work for the erection of store at Dudhope Crescent-road, Dundee, for the Corporation. Schedules of quantities, etc., of Mr. H. Richardson, M.Inst.E.E., General Manager and Engineer, Electricity Department, Dundee.

April 21.—**Dundee.**—Steel Work.—For the execution of steel work of roof principals for contractor house, No. 2 pump room, Carolina Port, for the Corporation. Schedules of quantities of Mr. H. Richardson, M.Inst.E.E., General Manager and Engineer, Electricity Department, Dundee.

April 26.—**Walthamstow.**—Water Softening Plant.—Supply to the U.D.C. Electricity Department of a water softening plant. Specification, etc., from Mr. G. R. Spurr, Electrical and Tramways Engineer, Priory-avenue, Walthamstow. Deposit, £1.

April 26.—**Warrington.**—Boiler Plant, etc.—The Electricty and Tramways Committee invites tenders for the following:—(1) Boiler plant; (2) economiser. Specifications, etc., of Mr. F. V. L. Mathias, Borough Electrical and Tramways Engineer, Howley, Warrington Deposit, £1 1s.

April 27.—**Dublin.**—Carriage Under-frames.—The Great Northern Railway Company (Ireland) invite tenders for twelve steel carriage under-frames, 58 ft. long. Copies of the specification, etc., of the Secretary at Amiens-street Terminus, Dublin. Deposit, 10s.

April 28.—**London.**—Heating Accessories.—The Commissioners of his Majesty's Works, etc., invite tenders for the supply of steam and hot-water heating accessories, etc. Forms of tender, etc., of the Controller of Supplies, H.M. Office of Works, King Charles-street, Westminster, S.W.

April 28.—**West Hartlepool.**—Extension of Boiler Plant.—Erection of a circular brick chimney shaft, 100 ft. in height, in connection with the Electric Power Station, adjacent to the Seaton Carew Ironworks, for the Corporation. Plans, etc., of Mr. Nelson F. Dennis, M.Inst.C.E., Borough Engineer, Municipal-buildings.

ROAD, SANITARY, AND WATER WORKS.

April 26.—**Birmingham.**—Tar Macadam.—For coating with tar macadam the carriageways of certain portions of roads, having a total length of about ten miles, together with other work connected therewith, for the Public Works Committee. Drawings, etc., of Mr. Henry E. Stilgoe, M.Inst.C.E., City Engineer and Surveyor, The Council House, Birmingham. Deposit, £2.

April 26.—**Felling.**—Paving, etc.—Fo channelling, sewering, kerbing, and c of back streets at the rear of Smokey Sunderland-terrace, Wardley. Plans, et Surveyor, Council Buildings, Felling-on

April 26.—**Kent.**—Rag and Block Supply to the Justices and Commiss Sewers for the limits extending from G Bridge to Sheerness, and thence along Medway to Penshurst in Kent, of good free from hassock, and large block sto E. L. Baker, Clerk to the Commissio chambers, Rochester.

April 26.—**London.**—Granite.—Suppl Lambeth B.C. of broken granite. M Penny, Town Clerk, Lambeth Town H ton-hill, S.W.

April 27.—**Dublin.**—Gravel, etc.—S pit gravel and pit sand for the Co Specifications, etc., from the City 28, Castle-street, on payment of 1s. form.

Auction Sales.

* May 2.—**Stoke Newington.**—Messrs Stanhope, & Co. will sell by auction premises, the stock of a builder, contra decorator.

* May 10.—Messrs. Churchill & S sell by auction, at the Great Hall, W House, Old Broad-street, E.C., an a of deals, battens, boards, timbers, etc.

* May 23.—**Rotherhithe.**—Messrs Smith, Oakley, & Gerrard will sell by at the Mart, a Thames-side wareho factory premises.

NEW COMPANIES.

THE undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C. :—

WILLIAM SALTHOUSE, LTD. (143,337). Registered March 20. To acquire, take over, and carry on business of lead, oil, glass, and colour merchant, plumber, painter, decorator, glazier, carried on as William Salthouse, at 21, Church-street, Preston, and elsewhere, sanitary, gas, hot water, and general engineers, builders, hardware and metal merchants, ironfounders, timber merchants, motor engineers, etc. Nominal capital, £5,000 in 5,000 £1 shares.

C. W. SHORTT & CO., LTD. (143,342). Registered March 21. To carry on business as agents for typefounders, manufacturers of and dealers in printing and other machinery, ironfounders, tool-makers, brass founders and metal workers, contractors, builders, painters, electrical and mechanical engineers, newspaper proprietors, etc. Nominal capital, £2,000 in 2,000 £1 shares.

HARLING & GLADWELL, LTD. (143,382). Registered March 24. To carry on business of builder and contractor and timber merchant, now carried on at Townhead Saw Mills, Rochdale, painters, decorators, gas, electric light, hot water and sanitary engineers, dealers in bricks, tiles, terra-cotta, pottery, earthenware, cement, lime, etc. Nominal capital, £5,000 in 5,000 £1 shares.

ARCHIBALD LEES, LTD. (143,403). Registered March 27. To acquire and take over business of A. W. Lees, at Standard Works, Halifax, and carry on business of mechanical, sanitary, electrical, gas, hydraulic and general engineers, bridge builders, machine and engineering tool makers, iron and brass founders, building and general contractors, painters, chemical manufacturers, metal workers, etc. Nominal capital, £3,000 in 3,000 £1 shares.

HENRY RIGHTON & CO., LTD. (143,411), 15, Coleman-street, E.C. Registered March 27. To carry on business of ironfounders, mechanical engineers, and manufacturers of all kinds, metal workers, boiler-makers, etc. Nominal capital, £1,000 in 1,000 £1 Ordinary shares.

ALFRED DANKS, LTD. (143,432). Registered March 29. To establish and carry on business of ironfounders, mechanical, electrical and general engineers, manufacturers of implements and machinery of every kind, tool-makers and metal workers, japanners, gas makers, carriers, merchants, builders and repairers of boats of every description. Nominal capital, £2,000 in 2,000 £1 shares.

E. M. LANDER, LTD. (143,438). Registered March 29. To acquire and take over business now carried on at 617-619, Harrow-road, Kensal Green, as E. M. Lander, and carry on business of monumental stone, marble and granite masons, quarry masters, stone masons, dealers in all builders' materials, builders' contractors, etc. Nominal capital, £2,000 in 2,000 £1 Ordinary shares.

WILLIAMS, ADDIS, & DOUGLAS, LTD. (143,492), 1, Central-buildings, Tothill-street, Westminster. Registered March 31. To carry on business of property owners, land, estate and house agents, auctioneers, builders, etc. Nominal capital, £500 in 1,000 10s. shares.

WALTER ROBB, LTD. (143,493). Registered March 31. To acquire, take over, and carry on business of electrical engineer carried on at Wakefield as Walter Robb, mechanical, sanitary and general engineers, coppersmiths, brass founders, metal workers, etc. Nominal capital, £10,000 in 10,000 £1 shares.

CHAMBERS & MARSH, LTD. (143,502). Registered April 3. To acquire, take over, and carry on business of timber merchants now carried on at Freith-street, Oldbury, as Chambers & Marsh, saw mill proprietors, timber growers, dealers in timber and wood of all kinds, and prepare same for market, builders' contractors, etc. Nominal capital, £10,000 in 10,000 £1 shares.

H. FAGAN, LTD. (143,525). Registered April 6. To carry on business of manufacturers of and dealers in furniture, etc., electric light, and sanitary engineers, builders, cabinet makers, etc. Nominal capital, £1,000 in 1,000 £1 shares.

H. G. COOPER, LTD. (143,526), 6, Fen-court, E.C. Registered April 6. To acquire and carry on business of electrical engineers and general office fitters, carried on at above address, furniture manufacturers, plumbers, hot water and gas fitters, decorators, builders, etc. Nominal capital, £2,000 in 2,000 £1 Ordinary shares.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3821. APRIL 28, 1916.

THE SHAKESPEARE TERCENTENARY.

WHEN the tercentenary of Shakespeare's birth was celebrated in 1864 the world was enjoying a momentary peace. Lectures, memorials, the performance of many plays then, as now, were obvious means of celebrating the day, the only jarring note struck in England, probably in the d. was that amazing speech in Exeter Hall recorded in lassic pages of "Father and Son," in which the poet was ibed to the passionate indignation of both as a lost soul burning in hell fire. The jarring note this year comes from an individual, but from a nation. More than ever Germans are insisting on Shakespeare as a discovery, st as a writer, of their own, claiming their cause as his were still alive, claiming his cause as theirs since he t. We cannot resent this, for resentment implies a certain ee of justice in the claim or it will lose its sting; we cannot se it, for it is too ridiculous for scorn. We can only laugh, aughter is fatal to German pretensions and infallibility, perhaps console ourselves with the reflection that there never been a moment in English literary history in which espeare has not been *laudatus a laudato*, honoured by the est of his countrymen, hardly a moment in which, some- e in his England, his plays were not being applauded by east, save during the gloomy period of Puritan domination ving on the execution of that King against whom a ness for the "lewd profanities" of Shakespeare was brought serious charge.

e all know that a change of taste came in with the oration, yet Davenant, who reopened the English theatre, fond of boasting his descent from Shakespeare, and a e at Pepys' Diary will show how well his plays kept their upon the stage. Betterton, the most famous of Restoration s, won his greatest laurels in "Hamlet." Dryden, play- it as well as poet, does homage to Shakespeare in prose rpassed to this day in eloquence as well as justice, and in enerous old age hails the youthful genius of Congreve with ry that

> Heav'n, that once was prodigal before,
> To Shakespeare gave as much, she could not give thee more."

edited him, and so, in a better text, did his rival, Theobald; son did him honour in prose; Thomson in verse; Fielding ually quoted him; Garrick, although too often using s "amended" version, set England ringing with his est lines, and was painted in some Shakespearean character nost of the artists of the day; Johnson brought out his delayed edition, the preface to which is the finest thing ver wrote. Boswell made himself ridiculous at Stratford ne Shakespeare jubilee of 1764, when fragments of the d mulberry-tree were treasured as things of price and sold then imposing sums; monuments rose in Westminster y and at Stratford; tokens were struck bearing the poet's . And all this, and more, in the "Philistine" eighteenth ury, from whose obscuring clouds Coleridge, in all the self- iency of the Romantic revival, set out to rescue Shakespeare y forty years after the publication of the Variorum edition set the seal of supreme scholarship as well as popular oval on his work.

he late Sir James Murray once said at a public meeting he believed that the Shakespearean revival, the free use hakespearean quotation, was due to Sir Walter Scott. at least of his audience longed to rise, not to deprecate great man as a true Shakespearean. "When I want to ess a sentiment which I feel strongly, I find the phrase in espeare," says his "Journal"—but to quote the supremely ant passage in "Mansfield Park," published several years re "Waverley," in which Henry Crawford is made to say, lo not think I have had a volume of Shakspere in my hand since I was fifteen. But Shakspere one gets acquainted with without knowing how. It is part of an Englishman's constitution. His thoughts and beauties are so spread abroad that one touches them everywhere; one is intimate with him by instinct." No, Shakespeare has never been obscured in England, much less deliberately disregarded. The nation has "to be or not to be'd" every evening of our Christmas holidays, to quote another phrase of Miss Austen's, until "Hamlet" has become part of our common speech and its very ghost a proverb. Take another test, the songs, and see how every generation has set Shakespeare's words to airs that have become the common heritage of Englishmen. Purcell, Stevens, Arne, Bishop, all have set his songs as songs were set before the age of drawing-room music, so that the words and air are one in the memory of all, and later versions only serve to show their own emptiness.

Leigh Hunt threw out a pleasant hint for the private celebration of Shakespeare's birthday, that families and friends should meet to read together one of the greater plays and to sing Shakespearean songs in rooms adorned with the flowers which Shakespeare loved. This is well, and might, as Hunt says, happen appropriately every year. What of this greater anniversary, this tercentenary? The programme proposed—lectures, plays, and the like—is well, but what of a greater and more permanent memorial? The subject of war memorials has already been raised with salutary cautions in these columns; we can but repeat the hope that the memory of Shakespeare, like that of the honoured dead of to-day, may not be insulted with vain and pretentious erections which bear witness to nothing but the incurable want of a monumental sense in modern England. The text of Shakespeare is as perfect as modern scholarship can make it; the setting of his plays wants no accessory which theatrical skill can devise. We have a Shakespeare Theatre at Stratford-on-Avon; we have whole companies devoted to the performance of his plays; we have the promise, if not yet actually the fulfilment, of a National Shakespeare Theatre, on a site admirably adapted for the purpose near the British Museum and University College. This theatre, the absence of which constituted the greatest blot on the literary side of our national escutcheon, is one of the many reforms postponed owing to the war, and, though we may well regret that the official celebration of the tercentenary cannot take place, as might have been hoped, within its walls, yet here as elsewhere the project is postponed to the convenience of public service in other fields. When the first performance shall be held in the completed theatre it will be felt to be in fact, as it will be in spirit, a public commemoration of the tercentenary.

The theatre being secured, can we not devise another means of commemorating the great name? Now that threats of invasion by sea and actual invasion by air have brought home to all the value of the land of England as our country, have roused the love of England as our goodly heritage, can we not ensure the preservation of some tract of English country threatened by a more insidious invasion, and hand down to posterity some unspoilt corner of Shakespeare's England, secure against the desecration or, as he says, the infection of the jerry-builder? Here surely the truest memorial of the tercentenary; the machinery is there in the shape of the National Trust, the country to be saved is omnipresent, the need for saving it is urgent. Let us join hands in this, remembering that small sums have their use as well as great, and our reward shall be the blessings of posterity and the sense that we have done our share in protecting and preserving in his name the land that Shakespeare loved:—

> This royal throne of kings, this sceptred isle,
> This castle of majesty, this seat of Mars,
> This other Eden, demi-Paradise;
> This fortress built by Nature for herself
> Against infection and the hand of war.

NOTES.

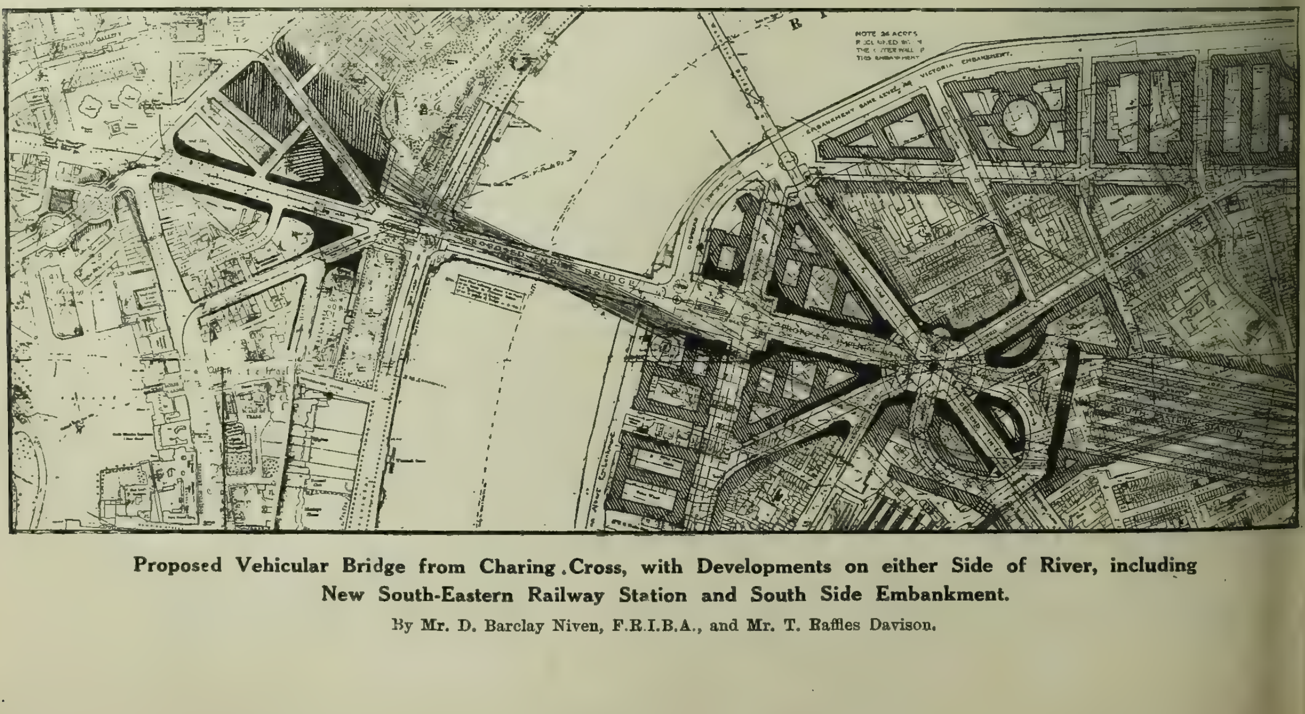
Charing Cross Bridge. We give an illustration of the well-thought-out proposal of Mr. Barclay Niven and Mr. Raffles Davison for the removal of Charing Cross Station to the southern side of the river and the resulting improvements which would be made possible thereby. We do not minimise the difficulties which lie in the way of the realisation of this great project, but we are entirely in sympathy with the endeavour of the London Society to procure the abandonment of the South-Eastern Railway Company's Bill for the strengthening of the existing monstrosity which spans the river and desecrates its beauty. Charing Cross Station is inconveniently placed and is an architectural eyesore, while it occupies an immensely valuable area. It is too early to discuss memorials which may be erected after the war, but the most fitting of all memorials, and the one most feasible in this country, is the accomplishment of a great work of public utility in a worthy manner, and such a new bridge, if architecturally treated, would be a most fitting memorial of the present titanic struggle, while it would be happily associated in position with Waterloo Bridge, which recalls to our minds the manner in which Europe was saved from the dangers which threatened it during the "Hundred Days."

Industrial Fatigue. The recent Memorandum issued by the Health of Munition Workers' Committee on Industrial Fatigue deserves consideration. Industrial fatigue may not be consciously felt by the worker, and yet may show itself in his work, and the Committee therefore consider the best tests that can be applied for discovering this latent fatigue. The output obtained is suggested as the best test if it is scientifically observed, both over short and long periods, and corrected for any variable factors. The effects of fatigue which has resulted in "over-strain" are of a more permanent nature, and affect capacity for periods far beyond the normal periods of rest, and the Committee therefore draw attention to the uneconomical policy of ignoring the requisite periods of rest, and observe that if the need for weekly rest had been observed earlier in the war a large part of the diminished capacity now being experienced would have been avoided. The Memorandum is a tribute to the patriotism of the munition workers, as their lessened capacity in many cases has been due to their strenuous efforts to maintain output despite their weakened physical condition. In a long war like the present this is a most important question, and the Committee dwell on the importance of maintaining efficiency by proper periods of rest; in fact, the report amounts to this, that a stitch in time saves nine, and that we in this country are behind some other countries in the application of physiological science to industrial conditions.

Liverpool Cathedral. The *Times*, in an admirably-written article entitled "The Mason's Way," describes the building of Liverpool Cathedral and the manner in which it recalls the procedure of the past, for the mason's way is what it was in the centuries which lie behind us and probably in the centuries which lie before us too. Modern invention has not created any method of replacing the mason's manual work, and processes by which stone is prepared and dressed are what t were when the great cathedrals of the past were slowly crea The building of Liverpool Cathedral would have been a work centuries; now it will probably be completed within a spa thirty years. Like the old cathedrals, the starting-point has made with the choir, but unlike most of them the nave will be car out on the lines originally contemplated. The critic of the *Ti* considers that the east end of the Cathedral shows an advanc quality of design compared with the Lady Chapel, which is w we should expect, since the greater power of design possessed by architect the more capable he is of learning by experience. We h that the people of Liverpool will consider the adequate comple of their great building the most fitting memorial they can erec commemorate those of their citizens who have fallen on the fiel battle.

Breadsall Church, Derbyshire. All Saints' Parish Church, Breadsall, in the of the Derwent and three miles distant from De was destroyed by fire by Suffragettes in June, 19 the tower and some portions of the outer walls were saved. The fabric has just been reinst at an outlay of nearly £9,000. The fine church, of which we publis a drawing by Mr. J. Tarney in our number of September 22, 1 has a chancel, nave, north aisle, and a tower with a lofty poi spire, octagonal at the base; the south doorway in the nave is Norman, and the nave arcade of three bays, together with the res the structure, is Transitional or Early English; in the south of the nave are square-headed Decorated windows; the east wind having five lights, is of the Perpendicular period. There were s ancient bench-ends of oak, sedilia of three bays, and in the cha a monument (1802) to Erasmus Darwin, the physiologist and p who lived in the Priory, which was built in the sixteenth cent upon the site of the Holy Trinity Priory, founded *temp.* Henry and was given by Edward VI. to Henry, Duke of Suffolk, in 1552.

The Civic Arts Association. The Civic Arts Association, whose foundation were glad to record, draw attention to a lis prizes amounting to £205 which they are offe as premiums for the best designs submitted eight classes of monuments, the prizes varying in amount from to £2. As they state, there is a great need for a class of memo which will be within the reach of those who have small inco and the Association hopes to put before the public designs suggestions such as frames for Rolls of Honour and photogra caskets for mementoes, and stands for holding medals. The ditions governing the competition will be sent to intending petitors who write to the Secretary at 28, Princes Gate, S.W., sen a postal order for 1s. and a stamped addressed envelope. The po orders will be returned on receipt of a *bonâ fide* design. The Arts Association are also prepared to offer the guidance of an ex advisory committee to public bodies or private individuals requi such assistance. We hope that the Association will have ev success in carrying out its programme, with the objects of which are in complete sympathy.



Proposed Vehicular Bridge from Charing Cross, with Developments on either Side of River, including New South-Eastern Railway Station and South Side Embankment.

By Mr. D. Barclay Niven, F.R.I.B.A., and Mr. T. Raffles Davison.

LONDON CHURCHES WREN AND LATER CHITECTS OF THE NAISSANCE.

XIX.—St. Stephen, Coleman-Street.

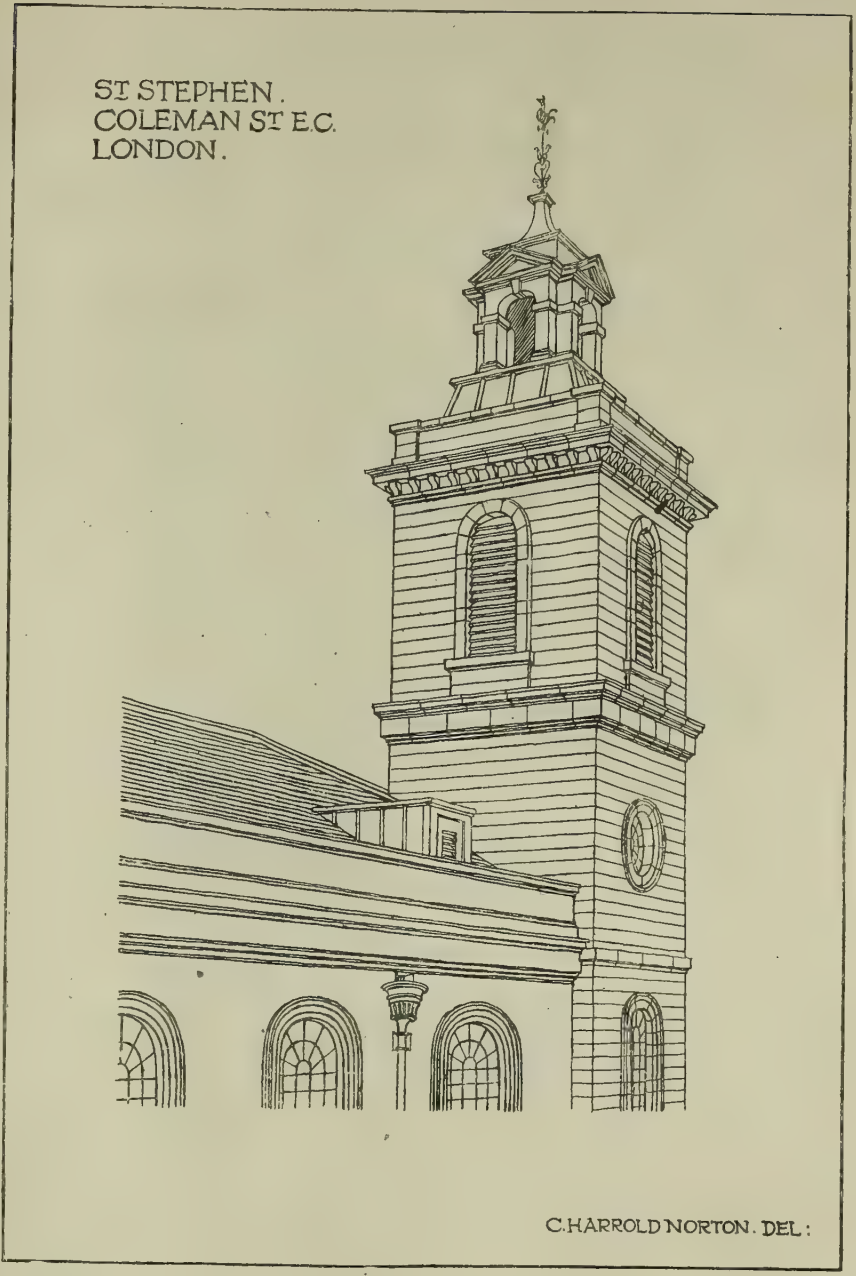
hurch of St. Stephen, Coleman-street,
an earlier structure which perished
ire, and was used for long periods as a
o St. Olave, Jewry. The patronage of
g has since the time of Queen Elizabeth
the hands of the parishioners. The
church is markedly irregular in its
l an example of Wren's disregard
netrical planning; the tapering form
less apparent in reality than it is on
contains some fine woodwork in
-piece and the doorcase on the north
ne chancel; but the lower part of the
nd the gallery with screen under are
poor in design. The east window
s filled in with a sacred picture which
described as being a transparency
han a window, and has a decided
n of the Baroque, which is also
in the very interesting gateway
o the courtyard at the side of the church.
rving over it, which is in high relief,
s the Day of Judgment, and the
on of the gateway forms a most
ue incident in a London street, supply-
interest and vigour which is found
and which the Baroque suggests
an any style before or after it. St.
Coleman-street, is one of the more
g among the smaller and simpler
churches.

XX.—St. Andrew-by-the-Wardrobe.

urch of St. Andrew-by-the-Wardrobe
s name from its proximity to the
eat Wardrobe, a house built by Sir John
np, Constable of Dover and Warden of
e Ports, which was purchased, after
, by King Edward III. and used as
or the Keepers of the King's Apparel.
ory is in the gift of the Mercers'
and with the parish is united that of
Blackfriars.

urch, which cost £7,000 to build, was
in 1692. The exterior is not remark-
itecturally, though a simple and
te expression of the galleried interior.
it is among the most pleasing of
urches, though exceedingly simple in
The segmental ceiling rests on
ave piers, which are panelled from
y level downwards. The intersecting
oins which form the ceiling over the
very pleasing in effect, the curves of
y are composed cutting slightly into the main segmental ceiling over the nave. The organ-case and woodwork generally are well designed and in a good state of preservation. Among Wren's churches this is one which has been least spoiled by additions or alterations and therefore better conveys the designer's intention than many other of his churches do.

There are a few monuments, characteristic of the manner of the later part of the eighteenth century and early nineteenth century, at the ends of the side aisles, erected in honour of three successive rectors—the Rev. William Romaine, who died in 1795; the Rev. William Goode, who died in 1816; and the Rev. Isaac Saunders, who died in 1836.



ST STEPHEN.

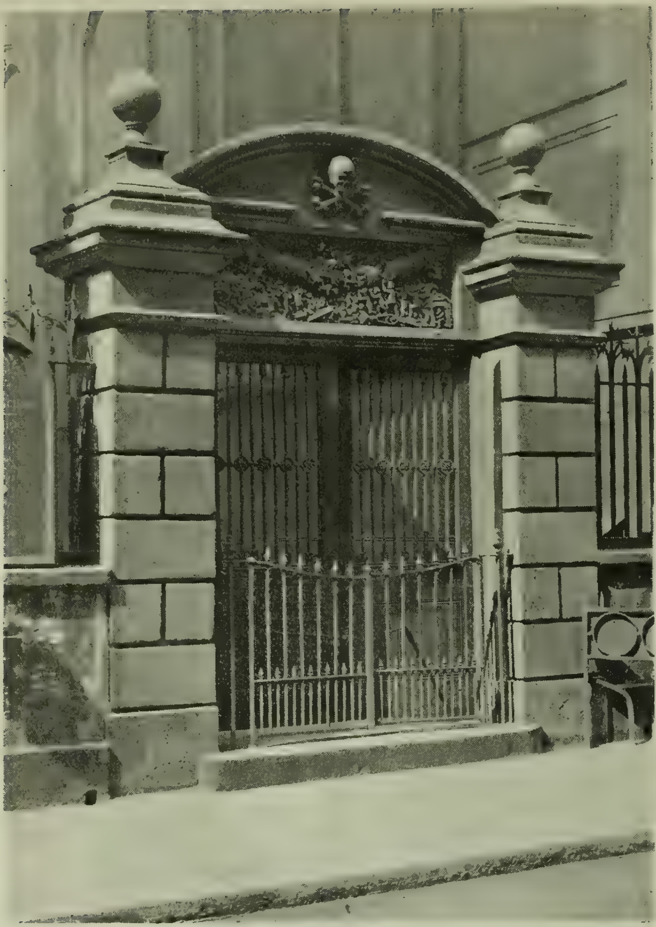
◆

HISTORIC CATHEDRAL DESTROYED.

It is stated that a violent fire broke out at Andria, near Bari, and almost completely destroyed the Cathedral there. The fire spread as far as the Bishop's Palace. The dwellings near by are in danger.

THE ROYAL ACADEMY SUMMER EXHIBITION.

As the Galleries are not required for the annual dinner, which will not take place this year, the President and Council have decided to make the cards of invitation to the private view available for either Friday, April 28, or Saturday, April 29, from 10 a.m. to 7 p.m. The public will also be admitted to the exhibition on Saturday, April 29, on paying an entrance fee of 5s.



Wren's Churches: St. Stephen, Coleman-Street, London, E.C. (*See page* 311.)

THE DEVELOPMENT OF LONDON.

SIR ASTON WEBB presided on April 18, at the hall of the Royal Society of Arts, over the second ordinary general meeting of the London Society, when Mr. W. R. Davidge, F.S.I., gave a lecture on "The Development of London."

The lecture was profusely illustrated with lantern slides of old maps and views of interesting streets and buildings, and Mr. Davidge made a running commentary on the views as they were shown. He remarked that London, like a great many other cities, was only just beginning to be discovered. The facts were very much scattered, and wanted a great deal of collating before one could come to any justifiable conclusion as to the original London. The first slides shown illustrated the Roman roads. These were Watling-street, coming from Dover to what is now Hyde Park Corner, and which proceeded by what is now called the Edgware-road to Manchester. Westwards was the road coming from Silchester, which also ran to Hyde Park Corner, and then went by a more or less straight line through Ludgate to the City, and thence through Romford to Colchester. Mr. Hilaire Belloc had recently traced out another road—Stane-street, which came from Chichester to London, and then ran northwards to Cambridge. The generally accepted view was that there was at first something in the nature of a citadel immediately east of Walbrook, where Cannon-street Station now stood, but the opposing view was that the citadel was west of Walbrook. The lecturer exhibited a plan of what he considered was the probable planning of the Roman London, and pointed out that the site of the Mansion House had always been the centre of the City, which stretched from the river to the Roman wall. There was a basilica at Leadenhall, and Wren, when he rebuilt Bow Church, discovered the remains of a Roman temple. The distance between this temple and the centre of the City exactly corresponded with the distance between the basilica and the centre, and they were practically in a straight line. Mr. Davidge also pointed out the sites of other buildings and streets in support of his conception of the planning. He proceeded to show the audience the gradual growth of London and the types of buildings of the different periods, and amongst other things mentioned that Cheapside was in the Middle Ages used as a tilting-ground and that old St. Paul's was a much larger building than the present. He referred to the plans of Evelyn and Sir Christopher Wren for the planning of London after the Great Fire, and said that Wren's idea of a broad new quay along the bank of the Thames was actually carried out. By the exhibition of maps of various periods the audience was enabled to see how the was gradually encroached upon by buil until in 1812 it was necessary to pass a of Parliament to whitewash the people had stolen this piece of public walk. In John Gwynn produced a plan for the London that was to be, and it was a c thing that there was hardly any scheme carried out but what was shown on that The Holborn to Strand improvement there, and also the site for Trafalgar-s although Gwynn placed it in rather a position. He further suggested Wa Bridge and the Thames Embank Reference was made to the fact that a hu years ago new main wide roads were pla as, for instance, the Euston-road, an lecturer urged that it was even of g importance that new roads should be pl and carried out now to meet presen future needs.

Mr. Crow, in proposing a vote of than Mr. Davidge, said he was glad he held opinion about Roman London in spite authorities who traversed his views. could hardly resist the conclusion tha Romans developed London somewhat i way suggested by the lecturer. As t suggestion recently made that the Roma stood on the other side of the river, th considered, was an absolute myth. He that the roads suggested by the Traffic were absolutely essential to London.

Mr. Barry Parker seconded the motio

Mr. E. G. Culpin considered if such le could be brought before the younger gene and they could learn more of the facts would have far more respect for Londo city, and there would be a great revival o patriotism and more determination to se improvements were carried out.

Mr. H. J. Leaning said that Londo tained an enormous number of ob arrangements, and they had to realise th time had arrived when many of these would have to be scrapped. Up to the p about the only thing scrapped were the trams. Amongst other things which have to go were some of the overhead via of suburban railways. They prevented communication, and it was perfectly imp to get a decent lay-out with these ugly via bisecting these districts. Since the G ment had taken over the railways the seen many of the stations closed on the side of the river, and this showed there be no inconvenience if they were rem Although town-planning was much in th they had no real scheme for the heart of Lo In some districts they had huge popul without open spaces, and he suggested some of the hospitals and other instit might be decentralised, and the sites the occupied utilised for open spaces. A object of open spaces was, to a great e

ovide recreation for the young, he
ted that local authorities might be
ered to erect halls and gymnasia.

Aston Webb said that before they looked
d too much it was well to look back and
w London had gradually grown. On the
hand, they had been looking back for so
years that he felt it was quite time they
to make use of their explorations into
st, and with more energy and determina-
e what could be done for London in the
It was, of course, an enormous subject,
they had all felt depressed by. They
feel what little effect they could have on
city, but still there was some hope.
avidge had referred to Gwynn. He (the
r) was proud to have an original copy
ynn's book, in which apparently on his
uthority he laid down certain lines of
ements in London, and, although he did
e to see their realisation, many of those
als had been carried out. It was quite
able, therefore, to expect a Society like
even in time of war, to be thinking
nally of the future of London, and for
o feel in doing so they were not entirely
ng away their time. Nothing could be
han for a body of citizens to join together
nsider how they could improve this great
and when they remembered that it was
sing at an alarming rate every year, and
creasing without any plan and without
e having the power to say that this or that
be done, it was impossible to exaggerate
nportance of the matter. It had been
hat London was ruled by about eighty
ities, and there was no supreme authority,
e thought they would agree that before
ng could be done there must be one
e authority for the whole of London.
ought the Borough Councils at present
very well after the details, but for the
objects there must be one supreme
ity to decide. The arterial roads
ed by the Board of Trade had been
ed of by all the local authorities, but
was no one at present who had the power
y that the land necessary should be
ed and left for the purpose of the roads.
n was being encircled with a series of
lanning schemes, quite regardless of
heme of roads, so they were trying to
e Government to empower some authority
they did not care what authority it
to settle once and for all the lines of these
arterial roads. Exactly the same thing
with regard to open spaces.

ote of thanks to the Chairman, proposed
. Lovegrove, concluded the proceedings.

THE
RVEYORS' INSTITUTION:
TOWN PLANNING.

ur issues of April 14 and 21 we published
rger part of Mr. W. R. Davidge's paper
d "The Principles and Position of Town
ing," which he read at the Surveyors'
ution on the 10th inst. We now give the
sion of the lecture :—

The Slum Problem.

he encouragement of the community sense
een much more in vogue in the United
than in this country. In the great cities
States an energetic campaign is carried
r the encouragement of the civic spirit,
roper pride in one's town; and in many
such as Chicago, this feeling finds its
in the endeavour to secure not only a
civic centre for the city as a whole, but
hbouring centres." Great Britain has
and prospered under the system of
iastical parishes, and it is difficult for
nglishman to realise the difficulties which
countries labour under where they have
had the advantage of organisation in
es and parish centres.

deal with the slum problem and the abolition
ms, very intimate and constant study of the
m is necessitated. In Chicago, for instance,
the study of slums has been reduced to
nce, observations over a large number of
blocks show a constant fluctuation in the
cter of the inmates. Galicians give place
ussians, and Russians to Italians. Whole
districts change from poverty to comfort, or from well-to-do districts to squalid tenements, but all these changes can be traced by careful study to a direct relation between cause and effect.

American Ideals.

American city planning may be divided into four phases :—

(1) Rapid transit (already touched upon), which may be described as the engineer's ideal.
(2) The civic centre, which may be described as the architect's ideal.
(3) The provision of diagonal avenues and parkways.
(4) The provision and linking up of parks, and the scientific distribution of children's playgrounds.

The Civic Centre.

The value of magnificent monumental buildings, in encouraging a sense of civic pride, is everywhere appreciated, and this, no doubt, is the reason for the American thirst for civic centres. The idea of an architectural conception or ideal, however, is unfortunately in most cases limited to monumental enterprises of this type which are little likely to be carried into effect, and the cost of which would be almost prohibitive. It is strange that such an eminently practical people as the American should devote so large a portion of their "city planning" programme to the provision of these costly civic centres, while allowing miles on miles of rectangular blocks and hundreds of five-story tenements to be built in all directions without a murmur. *Business centres and subsidiary centres will nevertheless form themselves in every town.*

Diagonal Avenues and Parkways.

It is a remarkable commentary on the rectangular block system of development everywhere to be found in the United States that, almost without exception, planning commissions are reporting in favour of the construction of new diagonal avenues across the rectangular system to provide access in a radial direction to and from the centre or business portions of the various cities.

The rectangular system of lay-out has generally proved quite satisfactory so long as the town remains of limited size, but once the town develops beyond the original square mile or so some form of diagonal communication becomes a necessity, and the improvement plans that are being prepared by practically all American cities are realising this essential point. Philadelphia has already spent some millions on the "Fairmount Parkway," which is nothing more or less than a diagonal of this description. Mr. Burnham's well-known plans for Chicago provided for several diagonal avenues of this description radiating from the proposed civic centre and city hall. The improvement plans of Brooklyn and scores of other cities in the States, and even so far afield as Santiago in Chili, all show the now generally appreciated *need for diagonal routes.*

The Linking-up of Parks.

The linking-up of parks by a system of parkways or tree-lined avenues is also a well-recognised part of American city planning.

The South Park system of Chicago is an excellent example of what can be done in this direction; but Minneapolis, Kansas City, and many others, are all examples of the same tendency. In fact, *there is a danger that the new fashion of city will be almost as stereotyped as the old.*

Provision of New Parks.
Special Assessment Principles.

The need for parks in the outskirts to provide for the growth which must come is everywhere realised, and during the last few years there has grown up a system of acquiring such parks for the public by means of a special rate or levy made by the Park Commissioners on all land in the neighbourhood, the value of which will be improved by the presence of the park. In this way many large areas have already been secured at Kansas City, Minneapolis, and elsewhere at little or no direct cost to the ratepayers, and it has been found in practice that the betterment in value of the property in the neighbourhood of the park more than recoups the owners for the small special rate they are asked to pay.

From fifty to 100 years ago London provided itself with a considerable number of new parks in the ring of open land just outside the then built-up area, and it is due to the foresight of our predecessors that we possess such parks as Regent's Park, Battersea Park, Victoria Park, and many others, all now embedded deeply in a sea of bricks and mortar. It is noteworthy that most of these parks were in those days provided at Government expense.

We may well ask ourselves whether we should not now be securing *further and larger breathing spaces around the built-up area of all our large towns,* and we might perhaps at the same time take a leaf out of modern American practice in order to relieve the ratepayers from any unnecessary burden.

The Preservation of River Banks and View-points.

In America it is now a well-recognised practice that *river banks and valleys should as far as possible be preserved for park purposes, and that view-points and hill-tops should be similarly preserved.*

Such a course is desirable not only from the point of view of amenity, but to secure the stream from contamination, and, at the same time, utilise land which in ordinary circumstances would be unsuitable for building purposes.

The Example of New Zealand.

In New Zealand there has been on the Statute Book for many years a law that the banks of all streams and rivers shall be reserved for a width of a chain or half a chain in width, and a special Government department has been set up to deal with natural beauty spots or "scenic reserves."

This but follows the still broader example set by several of the early New Zealand towns in entirely surrounding the township with a broad belt of townlands half a mile or so in width. The example of the park lands at Adelaide is, of course, well known, but it is not so generally known that Christchurch, Wellington, New Plymouth, Dunedin, and other towns in New Zealand were provided with a similar "town belt," and in several instances these park lands still remain the property of the town. In most New Zealand towns plots of land are also set aside for education endowment and other public purposes.

The question of municipal or State land purchase on a large scale has unfortunately in the past been made a political one, but from the national point of view it is worth while to consider whether it would not be well that *large areas of land around all towns should be acquired for future public use,* for agricultural purposes, the training of large masses of troops for defensive purposes, and for public health and recreation.

Street Planting.

Not only is it necessary to preserve the hill-tops and valleys and other natural beauties, but as far as possible the amenities of town life. In most communities there is a considerable proportion of the population which enjoys reducing everything to a dull level of ugliness, and seems almost to take a delight in removing everything in the nature of a tree or shrub.

The maintenance of trees and grass is always a troublesome question in England, especially in the neighbourhood of our manufacturing centres; but in America, although they have equally busy manufacturing districts, it seems quite easy to dispense with forecourt fences and to throw open stretches of greensward right up to the house itself. Such a town as Rochester, U.S.A., or Detroit, for instance, where thousands of motor-cars are manufactured every year, despite the absence of fences there is abundance of grass and trees, and nothing can surpass such towns as Los Angeles and other towns of the West and Middle West in this respect. Public opinion is all in favour of freedom, and no one thinks of doing damage to either trees or grass.

The way in which trees are ruthlessly cut down in this country whenever an estate is developed still leaves room for education, and the same process of destruction takes place wherever our countrymen settle. It would be a good thing if a licence had to be obtained from the local authority before cutting down any tree of over twenty years' growth, but this is a reform which has yet to come.

Control of Advertisement Hoardings, etc.

The control of street advertisements and hoardings comes within the powers given under the Town Planning Act, and here, too, public opinion is coming round to the view that advertisements need not necessarily be ugly.

They very often are, it is true; but this is more often due to want of thought than deliberate intention to offend. Too often the landscape along our railway routes and main roads is stamped for ever in our memories with "Pott's Pink Pills" or "Biles' Bilious Beans," writ large in the foreground. Such monstrosities ought for ever to consign these goods to perdition, but short of this all such advertisements should be subject to annual licence by the local authority and a good stiff licence fee per square foot.

Progress under the Act.

Some impatience has been manifested in various quarters at the slow-moving machinery set up under the Housing, Town Planning, etc., Act, 1909, under which a town-planning scheme takes years from the time of its inception to the date of its final approval.

In the six years that have elapsed since the Act was passed some 132 municipal town planning proposals have been before the Local Government Board in England, and seventeen in Scotland, but so far only five schemes have been finally approved. The position at December 31, 1915, was as under:—

England and Wales.	No. of Schemes.	No. of Local Authorities.	Area of Schemes.
Schemes finally approved ...	5	4	Acres. 10,265
Schemes submitted to Local Government Board for approval	4	4	4,058
Schemes authorised to be prepared...	112	78	180,498
Applications made for authority to prepare town-planning schemes	11	10	38,508
	132	91 (net)	233,329

Note.—Preliminary notices for other schemes have been served by about thirty local authorities.

At first sight one is inclined to regard this as a poor result for so much work, but in some ways it is well that such an important matter as laying down the future of our towns not be rushed through in a few months. work which needs both experience and ledge—experience of the needs and kno of the possibilities of the particular to well as a broad understanding of wh elsewhere been achieved.

The Civic Survey.

The establishment of tentative exper in civic survey work for particular are revealed to some extent the mass of pr ary information and statistical data ne to a full understanding of the proble few, if any, cases is it possible for a n grasp the details of the many-sided issues beset the problem of town planning, a civic survey is an attempt to bring t and collate the whole of the available in tion in a graphic form which will app only to the professional town-planne to the members of municipal counci others who often have not the time to p study the problems affecting their town.

The heads under which such informa most profitably grouped may be taken a

(1) The site: (*a*) Topography; (*b*) hist
(2) The industries: (*c*) Growth of com
    (*d*) causes and direction of gro
(3) The transit: (*e*) Traffic requirem
    origin and directions; (*f*) water
    railway traffic, road traffic.
(4) The enjoyment of life: (*g*) Health r
    ments, water, sanitation, fire prev
    (*h*) amenities, architecture, park
    playgrounds.

And last, but not least:—

(5) Financial considerations: (*i*) Land
    and property; (*j*) rating, taxati
    loans.

It may seem to some that this covers as wide a field as the examinations Surveyors' Institution. If so, it is a to the skill and forethought of those wh planned the Institution's examinatio embrace the many-sided activities of our sided profession.

Conclusion.

In matters of town planning, howev must realise that to foresee and provide whole future growth of our towns is n man's job, but many.

Every profession and every business right to be heard, and the plan itself m the result of whole-hearted co-operation b the surveyor, the engineer, and the archi

In the town plan an attractive site is o good without proper means of communi and efficient buildings.

The most perfect of communications b by road, or by water will be unsatisfactory the site is wisely chosen, properly sur properly drained, and properly built.

The most attractive design or group buildings will be of no avail unless the first of all suitable, the roads are pr graded, and the means of communi the very best that can be obtained.

Co-operation, therefore, between the fessions is necessary from the earliest of a town-planning scheme, and so far a Institution is concerned we can rely up willingness to do its share in co-operatio the architect and the engineer in the imp work of planning the future of our towns.'

COMPETITION NEWS.

It must be understood that the following paragr printed as news, and not as an advertisement; an while every endeavour is made to ensure accuracy, we be responsible for errors that may occur.

Town-Planning Scheme, York.

Professor Abercrombie, the adjudicat the competitive schemes submitted fo town planning of the suburbs of York recommended that the three premiums be as follows:—1, Mr. R. Dann, Crawley, Su 2, Mr. M. A. Piercey, Warrington; 3, M Noel Stephen & H. O. Burroughs, Liver and he also commends a scheme subm by Messrs. Allen, Thompson, & Thorp London.

ENERAL NEWS.

The R.I.B.A. Annual General Meeting.

ie annual general meeting will be held [onday, May 1, to consider the annual Report ie Council for the official year 1915-16.

New Academicians.

a general assembly of the Academicians Associates, Mr. David Young Cameron, A.E., ter; Mr. Maurice Greiffenhagen, painter; Mr. Bertram Priestman, painter, were ed Associates of the Royal Academy.

tional Portrait Gallery—New Trustees.

e Right Hon. L. Harcourt, M.P., and Herbert Frederick Cook have been inted Trustees of the National Portrait ry in place of the late Lord Ronald erland Gower and of Lord Fitzmaurice. the new Trustees are owners of important ollections.

Timber for the Army.

addition to the Defence of the Realm lations made by an Order in Council res it lawful for the Army Council or any n duly authorised by them to enter on land for the purpose of inspecting and ing trees, whether standing or felled, and ke possession of any such trees, and of land ildings for the purpose of felling standing converting trees, or storing or removing or converted trees; further, to take ssion of any plant used or capable of being for the above purposes, and of any vehicles, notives, or animals required for the port of trees or plant. Housing accomtion for workmen employed for the above oses may be provided by taking possession y land or unoccupied premises.

The Paris Bon Marché Fire.

e British Fire Prevention Committee issued one of their Red Books (No. 202) in ct to the Paris Bon Marché fire of November The report is illustrated, and indicates ast extent of this extraordinary fire in a ing that covered no less than some 50,000 ., and had an Auxiliary Military Hospital s fifth floor. The estimated damage was ess than £560,000, but fortunately no were lost owing to the precautionary ires taken to obtain ready means of exit the hospital referred to. It is pointed hat extensive fires of this kind have been y avoided in this metropolis by the fire ntive measures embodied in the London ing Acts and other enactments, and put ce by the District Surveyors, the London ty Council, and the Fire Inspection Depart- of the London Fire Brigade. The manner iich the great Paris Bon Marché fire was ed by the Paris Fire Brigade is made the ct of favourable comment in its report.

A Threatened Hull Monument.

interesting lecture on "The Merchant nturers of Northern England at Home and ad" was delivered in Hull recently by Maud Sellers before the members of the Riding Antiquarian Society. In replying vote of thanks, which was unanimously d, Dr. Sellers referred to the condition of old Grammar School. She had heard it l that the fine old building might be ved to make way for a modern structure. a step, she declared, would be an act of alism. It was a building in which the nant Adventurers of Hull used to hold meetings.—Mr. T. Sheppard, curator of Hull Museums, moved a resolution urging he Vicar and Churchwardens of Holy ty the necessity of ensuring the preservation e old Grammar School and pledging the ty to use its influence to this end, and orising its executive officers to take any n they consider necessary, whether by s of the Ancient Monuments Acts or wise. The motion was seconded by rman Brown.—Mr. J. Bilson, in supporting id he believed that the vicar and wardens red the property by subscriptions from ns who thought they were ensuring its rvation for all time. The Society ought ke the strongest possible measures to save The resolution was carried unanimously.

Pre-Raphaelite Pictures for the Nation.

It is officially announced that the Trustees of the National Gallery, with the aid of the National Art Collections Fund, have acquired from the Rae Collection a number of pictures by Rossetti and Ford Madox Brown.

Pict Chief's Dwelling.

It is stated in the Press that a spacious subterranean dwelling-place, supposed to be the home of a Pictish chief and his followers, has just been discovered by a Tiree crofter in the Kilkenneth district of that island. The structure is octagonal in shape, and is separated from an encompassing wall of the same shape by a passage 4 ft. wide and 5 ft. high. About 80 ft. of this passage has been investigated.

The Ideal Village Public-House.

Outlining the ideal of the new villages, which it is hoped will spring up and be peopled by soldiers at the close of the war, Professor S. D. Adshead, F.R.I.B.A., says that at the entrance to the village would be the village green, and the most conspicuous building to be seen from it would be the village public-house. The building would not be the resort of wastrels, but would be the social centre of the village. As seen from the outside, a conspicuous feature would be a verandah, where refreshments would be served out of doors. A door from the verandah would lead into the bar, but a second entrance would lead into a small hall where would be held all sorts of alfresco entertainments, including cinema shows.

Hampstead Garden Suburb and Housing for Officers' Families.

A meeting of the Housing Association for Officers' Families was held recently at No. 38, Bryanston-square. Lord Milner, explaining the objects of the Association, said one of their greatest difficulties after the war would be to find adequate house accommodation at a low cost suitable for people who had been used to a life of reasonable comfort and refinement. There were two branches of the Association's scheme. In the first place they proposed to provide colonies of houses or flats in suitable localities. It was proposed to add to the houses institutions like a club, a communal dining-room, tennis courts, etc. About £15,000 was required for the provision of the homes which it was proposed to erect in the Hampstead Garden Suburb, and about £4,000 would be necessary for their social amenities. Mr. Henry Vivian said the Industrial Provident Society had been registered as the South Wood Court, Ltd., and the site for the first group of fifty-three flats was on the south side of Hampstead Garden Suburb. It is not intended to begin building operations until the end of the war.

Architects and Town Planning.

On the 17th inst. the Liverpool Architectural Society held its annual meeting, at the resumption of the sixty-eighth session, in the rooms, 13, Harrington-street. The adopted Report showed a membership of 106, and that twenty-nine members and Associates, or rather more than one-fourth, had joined the forces, generally with commissioned rank. In regard to the Town Planning Act, the Council held that if architecture is to take its proper place in regard to town planning the Council consider it is necessary that an architect should be professionally engaged on each scheme during the early stages of its preparation, and this is a condition which can only be brought about at the instance of the Local Government Board. Officers were elected as under:—President, Mr. E. Percy Hinde; Vice-Presidents, Mr. G. Hastwell-Grayson and Mr. T. Taliesen Rees; Hon. Secretary, Mr. Richard Holt; unofficial members of the Council, Messrs. H. M. Appleyard, W. Glen Dobie, T. Edgar Eccles, C. W. Harris, P. C. Thicknesse, A. Thornely, and W. E. Willink (Fellows), and Messrs. L. P. Abercrombie and S. M'Laughlan (Associates); Hon. Auditors, Messrs. F. G. Briggs (Fellow) and L. B. Budden, M.A. (Associate). A paper, copiously illustrated by lantern slides and large prints, was contributed by Mr. Stewart Bale, on "The Work of an Architectural and Commercial Photographer."

A Deceased Builder's Estate.

Mr. Joseph Hill, of Gainsborough, Lincolnshire, builder, a director of Messrs. Shipley Brothers, Ltd., who died on February 10 last, aged seventy-three years, left estate of the gross value of £9,043 0s. 1d., of which £368 14s. 11d. is net personalty.

The Institution of Civil Engineers.

The Council of the Institution of Civil Engineers have made the following awards for papers read and discussed during the session 1915-16:—A Telford Gold Medal to Sir John Benton, K.C.I.E. (Eastbourne); a Watt Gold Medal to Sir George Buchanan, C.I.E. (Rangoon); a George Stephenson Gold Medal to Mr. F. W. Carter, M.A. (Rugby); and Telford Premiums to Mr. C. Carkeet James (London), Mr. D. E. Lloyd-Davies (Cape Town), and Mr. W. T. Lucy (Oxford). The awards for papers published in the *Proceedings* without discussion will be announced later.

Afforestation Schemes.

In a Memorandum which Mr. W. E. Whyte, Clerk to the local authority of the Middle Ward of Lanarkshire, presented to the Congress on Home Problems after the War, he pointed out that by the prosecution of suitable and approved afforestation schemes many important results will be secured. For example, the resources of the country will be developed (it was never so necessary before that this consideration should receive effect), and the most suitable of employment can be afforded to disabled soldiers and sailors. The need for timber in future years, as a result of the devastation which has taken place and the exceptional demands which have had to be met in connection with the war, will be exceedingly great and the prospects commercially will all be greatly enhanced.

A Shakespeare Exhibition.

In celebration of the Shakespeare Tercentenary a special temporary exhibition will be held at the Victoria and Albert Museum of a number of Shakespeariana acquired in past years largely under the Dyce, Forster, and Charles Kean bequests, which are not ordinarily shown to the public. The collection includes copies of the first, second, and third folio editions, as well as several early quarto editions of single plays, engravings of Shakespeare portraits, old playbills, etc. The exhibition has been arranged in the Book Production Gallery on the first floor (Room 74; access by the north-west staircase). Commemoration medals in silver and bronze have been issued by the governors of the Shakespeare Memorial Theatre, Stratford-upon-Avon. The medal, which is made from the design of Mrs. Dick, wife of the curator and librarian at the Memorial Theatre, bears on one side a portrait of Shakespeare, with the words "Shakespeare Tercentenary," and on the other his coat of arms and the inscription, "William Shakespeare, born 1564, died 1616. Stratford-upon-Avon, 1916."

Organising the French Building Trades.

A federation of members of the building trades has been established in France with the object of taking stock of the nation's requirements after the war, and, with the co-operation of the Government, facilitating the prompt resumption of normal economic life. The prospectus of the organisation says:—

"The State should make an immediate inventory of the present resources of France in materials of all kinds, in order to estimate the extent and character of necessary imports. These imports should comprise—

1. The materials necessary for putting into good condition our railways and to build the railways of Morocco.
2. The materials necessary for rebuilding homes and workshops.
3. The machinery and other plant needed properly to equip our factories and workshops.
4. The raw materials necessary for manufactures and trade."

It is in the interest of each individual to determine immediately the approximate quantities of goods which he will need, the merchandise which he can furnish, and the financial resources of which he can dispose, and to indicate the credit of which he may have need.—*Ironmonger.*

The Royal Institution.—Annual meeting. 5 p.m.

Tuesday, May 2.

The Royal Institution.—Mr. Laurence Binyon on "Indian and Persian Painting." 3 p.m.

Wednesday, May 3.

Institution of Civil Engineers of Ireland.—Ordinary meeting. 8 p.m.

Royal Archæological Institute.—General meeting. 4.30 p.m.

CORRESPONDENCE.

The Wonder of Work.

Sir,—I have been much interested with Mr. Pennell's standpoint on the "Wonder of Work," but think he has overlooked a few points which bear on the subject. It is only a comparatively small number of buildings, even now, which involve great engineering problems, and I therefore cannot see that the points which Mr. Pennell suggests are likely to revolutionise our minds on architecture. Besides the mediæval cathedral, which involved great constructional problems, we have as a legacy of the past the manor house and small church, which involved none, and each is perfect in its way. If Mr. Pennell wishes us to see and understand that great engineering works have a picturesque aspect he is revealing nothing new to us; if he wants to persuade us that the Vulcan Shipbuilding Yard is as great a work of art as the interior of Reims he is essaying an impossible task, which not even his standing as an artist will enable him to accomplish. In short, I find his attitude is as intolerant and indefensible as that of Ruskin, and should much like to know whether he praises or condemns the purely artistic expression of the Teuton as shown in the great war monuments erected all over Germany. Possibly Mr. Pennell will enlighten us further?

A Searcher after Truth.

ARCHITECTURAL SOCIETIES.

Nottingham and Derby Architectural Society.

The fifty-third annual meeting was held on Tuesday, April 18. The chair was taken by the President, Mr. Harry Gill, M.S.A. The Council reported that one member and one Associate member had been elected, and to M. Valentin Vearwyck, a Belgian architect of note, at present residing in Nottingham, the privilege of honorary membership has been granted until peace is declared. The death of one member, the resignation of two honorary members, four members, and the exclusion of one Associate had left a total membership of 116, a decrease of eight. A suitable greeting in the name of the Society had been sent at Christmas-time to the twenty-six members serving their King and country. Although the profession had suffered more than any other in consequence of the war, no case of absolute distress had been brought before the Emergency Committee of the Society. The Hon. Secretary had assisted the R.I.B.A. War Committee, but for some reason the results had not been commensurate with the time and trouble involved. The Royal Institute now urge all architects suffering from the effects of the war to take up munition work, and several members have already qualified. The members over military age were asked by the Local Parliamentary Recruiting Committee to canvas under Lord Derby's Scheme and several members gladly gave their services. No summer excursion was held, but four visits to works proved interesting and instructive. Four sessional meetings were held, at which useful papers were read and discussed. Notwithstanding the decreased membership, the funds of the Society showed a satisfactory balance, and it was unanimously decided to send a donation of 3 guineas to the Architects' Benevolent Fund and invest £15 in the War Loan.—Mr. Spencer, the Hon. Librarian, reported that several members had generously contributed books to the library, and Mr. Hendy, who was now on active service, had lent the whole of his books until the war was over.—A motion "that the rules as to election of officers be suspended and the present officers continue until April, 1917," was unanimously agreed to.—The President, Mr. Gill, thanked the members on behalf of himself, the Vice-President, Mr. H. G. Watkins, and the members and officials of the Council for the renewal of their confidence, and hoped that before their extended term of office was completed brighter times would have dawned for them all.

OBITUARY.

Dr. R. Cochrane.

The late Dr. Robert Cochrane, LL.D., I.S.O., F.I.A., a Fellow of the Royal Institute of the Architects of Ireland, was elected a Fellow of the Royal Institute of British Architects in 1892. He was architect of H.M.'s Office of Works, Dublin; principal surveyor under the Irish Board of Works; President (1911-12) of the Royal Society of Antiquaries of Ireland, and Inspector of Ancient Monuments for Ireland; in 1903 he was made a Companion Imperial Service Order. Dr. Cochrane was the architect of the Post Office, Armagh, and of the additions that were made, 1896-7, to Queen's College, Belfast, for the physics and engineering sides, comprising the pathological and physiological laboratories, with the "Harland," "Donald Currie," "Jaffe," and "Musgrave" Laboratories, and the biological laboratory, and also for the new students' union, with the "McMordie Hall," having a capacity for 400 people, and the students' dining, reading, committee, and other rooms and quarters.

Mr. G. Wormal.

The death took place recently of Mr. George Wormal, architect, at his residence, Rowley Park, Stafford. Mr. Wormal, who was a native of Lincoln, took up his residence at Stafford in 1872, and carried on his profession there until two or three weeks ago, when he was laid aside by illness. Many public and private buildings in the town and district were designed by him. He entered the Town Council in December, 1883, was Mayor of the borough in 1893-4, an alderman from 1895 to 1901, when retired. For seven years he was a membe the Stafford Board of Guardians.

Second-Lieutenant J. C. Bucknill.

Second-Lieutenant John Charles Buck Hampshire Regiment, who was killed January 22, was the son of Colonel J. Bucknill, R.E., of Thornfield, Bitterne, Ha He was educated at Wellington College an Emmanuel College, Cambridge, whence proceeded B.A., and then became an archi He obtained a commission in the Hamps Regiment in September, 1914, and went it to the Persian Gulf.

Mr. H. P. Horne.

The death is announced of Mr. Herber Horne. He was the architect of St. Jo Church, Ealing Dean, and of the cha St. George's, Hanover-square, burial groun Bayswater-road, W., 1894-5, for which mural paintings were executed by the Mr. Shields; he also made the designs for font, in red Cippo and yellow Sienese ma of St. Luke's Church, Rosemary-road, Cam well. Mr. Horne was distinguished by love for the arts, he was a high authority the work of Botticelli, and he wrote the in duction to Mr. Randall Davies's book on history of St. Luke's (Old) Parish Chu Chelsea.

THE LONDON COUNTY COUNCIL.

The fortnightly meeting of the Lon County Council was held on Tuesday of week in the County Hall, Spring-gardens, S Mr. A. F. Buxton, Chairman, presiding.

Loans.—Loans were granted to boro councils as follows:—£2,773 to the Bermon Borough Council for electricity purpo £5,000 to the Poplar Borough Council for st paving works; £3,170 to the Wandsw Borough Council for street improveme and £27,500 to the Woolwich Borough Cou for electricity purposes.

General Line of Buildings on the Southern of Euston-road between Southampton-street Fitzroy-street.—On the recommendation of Building Acts Committee it was agreed the decision of the High Court be obtaine the matter of the case stated by the Trib of Appeal relating to the general line of build on the southern side of the portion of Eus road between Southampton-street and Fitz street.

Blackwall Tunnel.—The Highways Commi reported that it is necessary for certain rep to be carried out to the asphalt paving portions of the carriage-way of Black Tunnel, and suggested that tenders should invited from selected firms. This was agree

Southern High-level Sewer, No. 2—Sale Land.—It was reported by the Main Drai Committee that application had been m by the South-Eastern and Chatham Rail Company for the Council's consent to construction of additional sidings over southern high-level sewer, No. 2, at Black Station.

South-Eastern and London, Chatham, Dover Railways Bill.—On the recommenda of the Parliamentary Committee it was agr to oppose the South-Eastern and Lond Chatham, and Dover Railways Bill with object of securing the rejection of the po relating to Charing-cross bridge.

FIFTY YEARS AGO.

The Law Courts Competition.

The judges of designs have selected additional architects, and withdrawn objectionable conditions. The list of twe now stands thus:—Mr. H. R. Abraha Mr. E. M. Barry, Mr. R. Brandon, Burges, Mr. T. N. Deane, Mr. Garling, Gibson, Mr. H. F. Lockwood, Mr. Sedd Mr. Scott, Mr. Street, and Mr. Waterhouse

locument is signed by twenty-two
aded by William de Grantham, and
llowing year twenty of the members
gether in the City house of the Abbot of Bury St. Edmunds, when they chose two wardens and drew up ordinances. Membership was to be limited to the "Pepperers of Sopers-lane, canvassers of the Ropery and Spicers of the ward of Cheap, and other people of their mistery wherever they reside." They bound themselves to contribute to the common fund, to wear a livery, and to submit disputes to the arbitration of the wardens, to maintain a priest, and to attend each other's funerals. Those who fell into poverty were to be helped out of the common fund, and on St. Anthony's Day they were to attend mass at St. Anthony's Monastery in Threadneedle-street and dine together afterwards. Three years later they dined together at the Rynged Hall in St. Thomas Apostle, and attended the adjacent Church of St. Anthony. At a later date the Cornets Tower, Bucklersbury, became their meeting-place. For twelve years the records are continuous up to 1358, when they are interrupted, and when in 1373 the record is resumed the fraternity had become the Grocers' Company (Compagnie des Grossers).

In the interval between the two dates two notable members of the fraternity, John Philipot and Nicholas Brembre, served as wardens, and afterwards became sheriffs. They were both knighted by King Richard II., together with William Walworth, for services rendered in the Wat Tylor riots. At the King's accession the grant of a subsidy to the King was made conditional on the appointment of two treasurers to superintend the application of the money, and Philipot and Walworth were appointed to fill the posts. It is stated that Philipot used part of the money to equip a fleet which cleared the North Sea and Channel of pirates.

Brembre, who had filled the office of mayor four times, was involved in the King's fall, and was one of the victims of the Merciless Parliament and died at Tyburn.

It was at this date that the weighhouse and superintendence of public weighing in the City was first controlled by the Company. John Chirchman, a grocer, built a house at Wool-wharf Key for the weighing of wool, and was appointed public weigher for life. He apparently made over his rights to the Company, who from this date to the end of the eighteenth century had the management of all the weighing in the Port of London.

The fraternity rapidly grew in power and importance; the City authorities looked to them to protect the interests of their trade, directing them to watch over non-members of the Company bringing spices or similar goods into the City. The goods so imported were to be sold within forty days of their arrival, and were not to be sold by the "foreigners" to one another. Regulations were also laid down as to "garbling" or checking fraud with regard to spices and drugs which were sold by weight by the compulsory clearing of such goods, and in 1447 the Company were appointed official "garblers" for the whole kingdom outside the City, in which the Court of Aldermen had the right of appointing the "garbler."

In 1411 the members purchased the chapel belonging to the family mansion of Lord FitzWalter, the hereditary standard-bearer of the City, and in 1427 the mansion itself. Their property extended from near Old Jewry to the banks of Walbrook, which then ran through the middle of the site now occupied by the Bank of England, and discharged into the river near the site of Cannon-street Station. The approach to the site was by Coneyhope-lane, now known as Grocers' Hall Court.

The foundation-stone of the Hall was laid on May 8, 1427, and on February 5 next the members dined together there at a cost of £5 6s. 8d. The building consisted of a hall for meetings, a parlour, probably for the use of the wardens, a buttery, and a pantry, and was completed in 1428. The garden was laid out at considerable cost, and was used not only by members of the Company, but by neighbours for playing bowls and other games.

In 1428 the first charter was granted to the Company, under which they became a legal corporate body with power to hold land within the City and suburbs to the value of twenty marks "towards the support of the poor of the Company, and of a chaplain to pray for the King while living and for his soul when he was dead, likewise for all persons of the said mistery and commonalty and the souls of all faithful deceased."

The right of holding land in spite of the Mortmain Act was extended by a charter of James I. to the value of £200, and by that of Charles I. in 1640, without limit, but it has always been held that this applies only to land within the City. The management of the Company's affairs was at first vested with two wardens of purveyors, who were chosen after an annual dinner held in the month of May. After the dinner the wardens were to come with garlands on their heads, and the Company were to choose for their three wardens for the ensuing year "those upon whom the garlands shall be set," and deliver to them papers and money belonging to the fraternity. In 1379 it was enacted that six members of the Company were to be chosen to assist the wardens for the following year, which was the origin of the Court of Assistants, which were fixed in 1640 at fifty-one assistants and four wardens; it is now considered that thirty assistants are sufficient to manage the affairs of the Company.

The troubles of the Reformation did not affect the City Companies, which conformed sufficiently to the law to escape danger. Richard Grafton, who became Master of the Company in 1563, though apprenticed to a

grocer, published an edition of Tyndale's Bible known as Matthew's Bible. He was also instrumental in securing the great religious houses of Grey Friars, St. Thomas, Bethlehem and Bridewell for the services of the poor. Latterly he fell into poverty and was assisted from the funds of the Company.

In 1558 Queen Mary demanded a loan from the City, towards which the Company had to find £7,555; this was the first of many enforced loans, which became a grievous exaction in the times of the Stuarts.

By a charter of 4 James, 1606, the Grocers had obtained a renewal of their privileges in connection with the sale of all goods, including drugs, and no idea was apparently entertained that any dissolution of the bond between two sections of its members was likely to take place. Throughout the reign of Elizabeth and her successor there was general complaint of the incompetence of apothecaries, the wardens frequently seizing bad or adulterated goods, and in 1617 the King moved in the matter and granted a separate charter to the Apothecaries, restraining the Grocers and other Companies from keeping an apothecaries' shop and from exercising the "mistery" in London or within seven miles of it, requiring every apprentice to serve his full term and to obtain a certificate from the College of Physicians, and conferring on the new society powers of search, seizure, and destruction. On the Grocers complaining the King rejoined, "The Grocers who do complain are but merchants."

In 1692 Parliament demanded £9,000, and the Company's plate had to be sold to provide the funds needed, but this was willingly paid, as the City staunchly supported the cause of popular liberties.

The Committee of Safety appointed by Parliament to watch over the interests of the nation met in Grocers' Hall.

Later, the City recognised the advantages of a restoration of the monarchy, and General Monk was invited to a banquet at Grocers' Hall in 1660, and was afterwards made free of the Company, which was the first instance of the honorary bestowal of the freedom in recognition of public services. When Charles II. made his State entry into London he accepted the office of Sovereign Master of the Company at the request of Sir Thomas Alleyn, one of its members, who was then Lord Mayor. He was never formally admitted, but it was ordered that the feast usually held at some date in May in commemoration of St. Anthony should in future be held on the 29th and called the Restoration Feast.

The Great Fire of 1666 added to the difficulties which had arisen through enforced loans, as all the Company's premises and property were reduced to ashes. The Company's main resources for funds in the shape of fines levied on the reletting of houses failed them, the value of building sites fell, and the rents obtained were not sufficient to meet the payments for charitable purposes charged upon them.

The rebuilding of the Hall was felt to be absolutely necessary, but only £700 could be collected by a personal appeal to members. Sir John Cutler at this juncture loyally and liberally aided the Company by building at his own expense a dining-room and parlour, and thus providing a meeting-place for the members; but in spite of Sir John's assistance it was found impossible to complete the rebuilding, and in 1672 the Governors of Christ's Hospital, to whom the Company were liable for payments charged on properties bequeathed to them, took possession of the Hall as security for arrears due to them. At last with difficulty the arrears were paid off and the Company resumed possession of their Hall. A great effort was subsequently made to complete the buildings, which, it was held, might be a source of revenue, and it was finally done by the aid of Sir John and others.

In 1690 a new charter was granted to the Company under William and Mary, and the King served the office of Master in 1689, and directed that three fat bucks should be sent annually in perpetuity to Grocers' Hall, but the Royal Bounty did not survive the King's reign.

The turning-point in the fortunes of the Company came in the year 1694, when the Bank of England was founded. Business was started in the premises of the Mercers' Company, Sir John Houblon, a grocer, being the first Governor.

In October the business was transferred to Grocers' Hall, under an agreement which provided for an eleven years' tenancy on payment of a fine of £5,000 and a loan of the like amount. The Bank continued to be the Company's tenants till 1734, when the house and gardens, which had been the property of Sir John Houblon, in Threadneedle-street were bought, and the Bank of England erected from Sir John Soane's designs.

For nearly a century the Company maintained their position with difficulty, and could do little more than pay their way and discharge their obligations under their trusts; but at the end of the eighteenth century they were able to contribute considerable sums to private charities.

They offered their honorary freedom to William Pitt at a crisis of his career, and supported the Coalition when he took office in the face of a hostile majority in the House of Commons, their action contributing something towards his success in holding the position he had so boldly accepted. During the nineteenth century they were enabled to extend their benefactions, as, although not among the wealthiest guilds, they were not encumbered with trusts or involved by obligation through their connection with any trade or craft, so that the funds they possessed could be freely dealt with.

Architecturally, Grocers' Hall is not among the most interesting of the Livery Halls. Of the mediæval buildings which were destroyed by the Fire no adequate representation remains, and we can only gather that the old Hall was a large room with mullioned windows, with a room, or rooms, attached, and a buttery or other service accessories. The Hall of Staple Inn, with a few rooms added, probably represents what in mediæval times would have met the needs of one of the City Companies. As we have seen, the Fire caused such financial losses that the Grocers were for long unable to provide themselves with any premises to meet in, and want was met by buildings erected by private munificence, and completed after a lapse of years in what was probably a purely utilitarian manner. At the beginning of last century, in 1800, these buildings were replaced by a simple L-shaped building of modest dimensions, designed by Thomas Laverton, and containing the Hall and offices. The buildings did not utilise a site which had become very valuable to full advantage, and the buildings were demolished and the fourth Hall erected.

The Company's late surveyor, Henry Cowell Boyes, designed the present Hall and offices, which were erected between the years 1889–93 at a cost of about £100,000. An ingenious use was made of a valuable site, which was utilised by the erection of a large block of revenue-producing offices facing Princes-street, at the extreme limits of which driving ways give access to a courtyard on the farther side of which the new Hall is placed. The planning of the new buildings is good, though the junction between the two wings is somewhat awkwardly worked out, and the disposition of the main entrance and staircase and its connection with it is a little cramped and indirect. The external detail of the new building is Jacobean in its rendering, but there is a want of cohesion and uniformity between the treatment of ground and upper stories. The internal design is more satisfactory, though in parts too ornate. The staircase and Court-room are the best-designed portions of the new building. The hall, though a fine room, is a little tame, while the Drawing-room is over-elaborated. As a whole it forms a convenient and suitable building for the purposes to which it is put, though it is to be regretted that the "Wren" note, which is so marked a feature of the old Halls, was not adhered to.

As will have been gathered, the functions of the Grocers' Company in connection with trade and commerce have become obsolete with the changes which have grown up during the last two centuries, and the Company have become increasingly an association closely connected with educational and charitable
work, although an exceedingly small por

THE BUILDING TRADE.

OUSE PROBLEMS AFTER THE WAR.

NDER the auspices of the Housing and Town Planning Council a Congress was held in London recently, and ted in our last issue, at which subjects were ssed which are of interest to the building A number of useful and practical tions were passed.

most important proposals for the ng trade were those calling upon the rnment to provide a sum of not less £20,000,000 for the carrying out of housing tions immediately after the war and for reparation by local authorities, meanwhile, sing schemes, in readiness for that eventu- so that the danger of serious unemploy- in the building trades may be avoided.

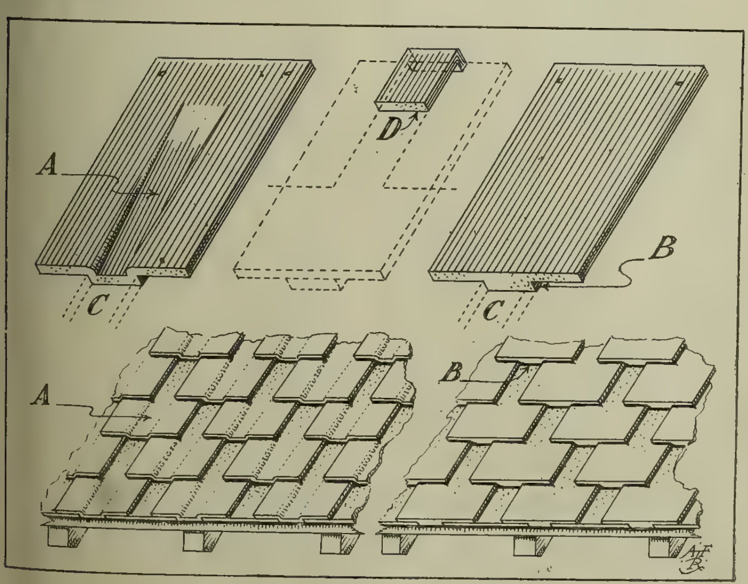
re is no doubt that the provision of l for housing purposes by Government e necessary, otherwise the present high of money and building materials will sly postpone the already urgently needed building and aggravate the shortage is clearly evident now.

debates on this problem brought out the causes of this shortage, viz., the sing attractiveness of other forms of ment; the increased cost of building; nore stringent requirements of local ities in regard to repair and alteration of to make them fit for human habitation; ndency of rates to rise with consequent e of rents; the increased dearness of ; the effects of the Finance Act of 1909; llection of rates and the compounding increased stamp duties and the costly ds of conveyancing, which hinder the r of land and houses; the areas which heduled for town-planning purposes, uncertainty which exists whilst schemes ng prepared as to what their provisions ely to be. The causes are thus shown complex in character, and no simple will meet the case. The Congress that the amendment of the Finance prevent the taxation of the profits of ise, already twice promised by Govern- should be carried into effect, and that npounding limit should be reconsidered. touching the question of finance, a e report was presented on the subject k Loans at Insurance Rates, by Mr. Branford, which will repay careful study; nts in a lucid form an analytical survey ntricate subject which is little under- utside banking circles, and should point the way to some form of credit banking for the purpose of providing housing finance on a more favourable basis than is at present practicable. A reform of this kind lies at the very root of the whole problem of cheap housing and the payment of an economic rent; it is earnestly to be hoped that the paper will attract the attention it deserves from those capable of giving effect to it.

A NEW ROOFING TILE.

MR. A. FLETCHER TREW, of Holmwood, Rusham Park-avenue, Egham, Surrey, has invented and provisionally protected a new roofing tile called the Surrey Roof and Weather Tile, which we illustrate, and he desires to correspond with makers and users of tiles and to arrange terms for their manufacture. By the use of this tile only 370 tiles are required to cover a square as against 554 plain tiles, hence the weight is reduced to 8¼ cwts. per square, and a similar saving in cartage, hauling, and roof timber is made possible.

The sketch explains the principle of the invention—A is the channelled and B the indented pattern tile, C the interspace tile, and D the spacer or loose indent. The invention is one by the use of which economy is promoted, and therefore will be interesting to many, though where reasons of economy are not paramount most architects would prefer the appearance of plain tiling.



A New Roofing Tile.

TRADE NEWS.

Boyle's latest patent "air-pump" ventilators have been applied to St. Matthew's School, Preston.

The Ancoats Hospital, Manchester, is being supplied with Shorland's double-fronted warm-air ventilating patent Manchester hospital stoves, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

An underground vault was constructed for the National Bank of India in Clive-street, and, owing to the proximity of the Bank premises to the river, water percolated into the vault very freely even after it had been rendered with cement plaster. A mixture of Pudloed cement was then tried and proved very successful.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The Plans Committee of the T.C. has sanctioned the following plans:—Alterations in connection with the premises No. 8, Queen-street, for the Northern Loan Company, Ltd.; alterations at 141, Union-street, for Messrs. Boots, Ltd.; alterations at 435-437, Union-street, for Mr. George Bowman, draper, additions to premises, College-street, for Miss Reid, Albyn-place; cold store at 457, Union-street, for Mr. William Findlay.

Arbroath.—A free gift sale in aid of the building fund of the new Arbroath Infirmary was recently held in Arbroath Auction Mart.

Aylesbury.—At a recent meeting of the U.C. plans were passed for the County Palladium and Picture-Dome to be erected in Exchange-street, Aylesbury, for Messrs. Field & Son, Ltd. Mr. Fred Taylor, Bourbon-street, Aylesbury, is the architect.

Bedford.—The following plans have been approved by the T.C.:—Temporary additions to carriage house, Holt-row, for Messrs. Clarabut & Plumbe; temporary coffee bar, 23, Kempston-road, for the Trustees, Soldiers' Home; new house, Castle-road, for Mr. T. Rogers; proposed gallery, The Palace, High-street, for the Bedford Palace, Ltd.; two water-closets and lavatory, the Pyghtle Works, for Messrs. J. P. White & Sons, Ltd.; bathroom, Abbey Cottage, Cardington-road, for Mr. M. T. Hurst-Hodgson; motor showroom, Cauldwell-street, for Messrs. W. Nicholls & Son.

Bradford.—Messrs. Brown, Muff, & Co., Ltd., have acquired possession of the block of buildings at the corner of Tyrrel-street and Ivegate, Bradford, for the extension of their premises.

Bridport.—The question of the proposed repairs to the Town Hall buildings has been referred to the Town Hall Committee to consider and report.

Bristol.—The Docks Committee contemplates erecting nineteen houses on vacant land under their management at King-street, Avonmouth, for the accommodation of men employed at the Docks.

Buckie.—Plans passed by the T.C.:—Engineering shop at the Patent Slip & Shipyard Company, Ltd.; motor shed in West Church-street, for Mr. William Logie; and alterations at 29, East Church-street, for Mrs. Geo. Paterson.

Burnham.—The Council has passed plans for a temporary workshop at 43, Adam-street, for Mr. W. T. Baker.

Cardiff.—The Corporation Electric Lighting Committee has approved a proposal for extending the Hayes sub-station at an approximate cost of £1,200.

Cullen.—The T.C. has received a plan from Mr W. E. Taylor of proposed alteration to house in Grant-street belonging to him.

Eastry.—The R.D.C. has passed plans from Messrs. Jennings & Duthoit, architects, for alterations and additions to "The Star" Inn, Tilmanstone, for Messrs. Leney & Co., Dover.

Edinburgh.—The directors of the Caledonian Railway Company have authorised the reconstruction of Slateford Station. The contract for the new buildings has been let to Mr. John Shirlaw, Carluke, while the heightening and lengthening of the platforms is being carried out by the company's men. The new overbridge will be provided by Messrs. P. & W. Maclellan, Ltd., Glasgow.

Egremont.—The D.C. has approved plans of suggested alterations to 58, Main street, for the London Joint Stock Bank.

Glasgow.—Glasgow Dean of Guild Court has granted the following linings:—The Tharsis Sulphur and Copper Company, Ltd., 136, West George-street, Glasgow, to erect buildings on Garngahill; Messrs. Redpath, Brown, & Co., Ltd., 19, Waterloo-street, Glasgow, to erect new buildings in Borron-street and North Canal Bank-street; Messrs. K. Cockburn & Co., Ltd., Clydevale Engineering Works, Cardonald, to make alterations on existing buildings at Cardonald; Messrs. Alexander Stephen & Sons, Ltd., Linthouse, to erect office, cloakroom, and

items include shelters and a pavilion.

Irvine.—Irvine Dean of Guild Court has
plans of an extension to Mr. A. Cunnin
hosiery factory in Ayr-road, and of a
house or music hall to be erected by the S
Kinemas, Ltd., in Montgomery-street

Kingstown.—The U.C has decided to
to the L.G.B. for sanction of a loan amo
to £76,218 6s. for the erection of 271 hou
the working classes.

Longniddry.—About forty cottages are
erected at Longniddry, on Lord Wemyss's
for the accommodation of disabled s
These houses are being put up in connecti
the scheme promoted by the Scottish Ve
Garden City Association.

Newcastle.—At a recent meeting of the
and Charities Committee of Newcastl
pcration the application for a lease
Singleton House site in Northumberland
on which it is proposed to erect hotel an
premises, was dealt with.

Ossett.—The T.C. has approved the fo
plans:—Addition to Springwell House a
version to two dwelling-houses, for Messr
Illingworth & Son; carbonising place a
chimney at Paleside Mill, for Messrs. A.
Sons; wood shed in Park-square, for Mr.
Waite.

Rhyl.—The U.D.C. has passed a plan
motor garage by Mr. Thos. Lloyd at
Plastirion-terrace.

Richhill.—The Armagh Farmers' Co-op
Society, Ltd., has decided to erect a ne
in the vicinity of Richhill for the pur
scutching flax.

Ripon.—The L.G.B. held a public inq
Ripon recently in connection with the
tion of the City Council for sanction to
£900 for the purposes of their gas underta

Rosyth.—Dunfermline School Board
considered a letter from the Education
ment pointing out that it was proposed
a Roman Catholic school at Rosyth
accommodation of 250 pupils. The Board
no objection.

Ruislip-Northwood.—The U.D.C. has a
a plan for a house in Ickenham-road, for
Bush, submitted by Mr. A. J. Soutar.

St. Helens.—Plans passed by the T.C.:
garage in Henry-street, for the St. Hel
operative Society; additional rooms at
Mount, West Park-road, for Messrs. Pil
Bros., Ltd.; addition to Boys' Home, Rav
Ravenhead-road, for Messrs. Pilkington
Ltd.; motor shed, Bishop-road, for Mr.
Peet.

Selby.—The U.D.C has resolved that,
to the sanction of the L.G.B., tenders
erection of thirty houses on the south
Flaxley-road and of thirty-one houses o
Common be accepted.

Southend.—The T.C. has approved the
ing plans:—Conversion of house into
Hillside-crescent, Mr. D. W. Wayland;
low, Pavilion-drive, Mr. D. W. Kempen
and shed, Pall Mall, Leigh, Mr. R.
additions to two houses, Theobalds-road,
Smith; one bungalow, Silversea-drive,
Posgate; one house, Leigh Hall-road,
Bridge.

known as No. 3, comprising the town
Llay.

ARCHITECTURE OF
NDERS AND NORTH-
TERN FRANCE.*

F treating of the particular phase of
ure that is our subject, I wish to say
ords on the art generally; and, to
e with, we had better get a clear idea
we mean by architecture.
ke an illustration:—You may build
so as to be convenient, comfortable,
tantial: but these excellent qualities
ough to make it a work of architecture.
g more is required. What is it?
ft-quoted authority, the man in the
ould answer—ornament. He would
e usual architectural features with a
nd, playfully pepper the façade with
apply columns and carving *ad libitum*
nauseam, and, finally, flatter himself
had achieved greatness. But there
things in the art than are dreamed of
philosophy. The something wanted
btle to be discerned by his partially
understanding. It is the brain-
at shall shape the outline of our
building, proportion the parts, and
se the materials so as to obtain a good
sing effect by those means alone.
btained that effect, ornament can be
he purse permits; it is an accessory,
sirable accessory, certainly, in many

ecessary to emphasise this, as some of
al public think an architect is only
when an ornate building is desired.
t was the late Sir Henry Cole who
that when a Government building
e erected, an officer of the Royal
should get out a plan and outline
and then an architect should be called
borate and ornament it. He would
reduce the architect to the plane
rhanger and deprive him of his proper
f guide, philosopher, and friend to all
to build.
le-duc wrote:—"A perfume of art
from the least pretentious Greek
as well as from the most magnificent
nd the small houses of Pompeii, built
d brick, are as much works of art as
buildings of that city."
e say good effect, suitable effect is,
. implied. The design of the new
f the Regent-street Quadrant is a
ample of good features being used
an unsuitable effect. For the head-
of Mr. Sandow or the War Office it
admirable, because it is expressive
al strength; but for a row of shops,
first requisite is plenty of glass, it
nsuitable.
hitecture, of course, is based on
ion; and in the best examples the
ral detail emphasises and expresses
ruction. There are only two types
uction, lintol and arched. It is
hat the former can only be used
e stones are available. Where only
ones or bricks are to be had,
st be used. Greek architecture is
tol. The Romans used the arch as
he lintol, and their successors, the
ue architects, used the arch exclu-
e round arch, of course, the pointed
being used in Western Europe until
s being developed. It soon became
on account of the much greater ease
h a church could be vaulted when
rches were used instead of round.
he beginning of the sixteenth century
gs in every country were designed
revailing style of the period, and
re was a living progressive art.
great revival of the Renaissance
, which has been followed by number-
r ones.
h a great deal of most beautiful
re has been designed since the
ce it may be said, in a sense, to
the fall of architecture. Up to then
worked in their own style, and their
was so firm that they had no desire to change. They were not, like moderns, "blown about by every wind of doctrine," and always seeking "some new thing." Architects have now eaten of the tree of knowledge of good and evil, are surfeited by the information gained from travel and books, and have been unable to settle down for long to any particular phase. They work for a few years in one style, and just as they are getting used to it, suddenly go off to something quite different. A few years back a quiet type of English Renaissance was being used with great success. It looked as if the tradition broken by the Gothic revival might be picked up, when a sudden swing of the pendulum occurred and the so-called French Greek was introduced.

These frequent changes are detrimental to the art, and true progress cannot be made until there is more continuity of policy.

A number of lantern slides of Reims, Amiens, Laon, Soissons, and Chartres Cathedrals, and of the Town Halls of Bruges, Ypres, etc., and other buildings were shown and described.

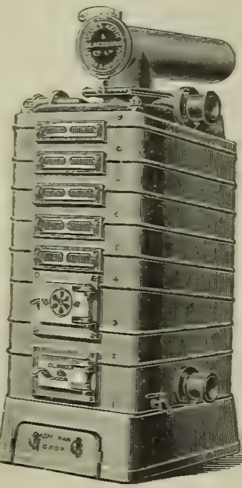
ssociation by Mr. W. J. H. Leverton,
B.I.B.A.

TRADE CATALOGUE.

We have received from James Keith & Blackman Company, Ltd., engineers and manufacturers of volume and pressure fans, the "Keith" light and heating apparatus, etc., of No. 27, Farringdon-avenue, E.C., a useful and well-arranged catalogue describing their improved sectional "Challenge" boiler for water heating. Invented nearly forty years ago, when in this country central heating was in its infancy, it was put on the market, as its name implies, as a challenge to the wrought-iron saddle boilers then in use. The "Challenge" boilers are constructed of cast-iron sections placed one upon the other, the joints being accurately machine-faced. The boilers stand complete in themselves, no brickwork being required; the largest size can be erected in a few hours. There is no internal flue action. The bulk of the heating surface being directly over the fire, the heat is utilised to the best advantage. The construction of the fire-box allows a very deep fire to be used, thus minimising the amount of attention required and materially reducing the fuel consumption. The small amount of floor space occupied renders it possible to instal a battery of the largest "Challenge" boilers in a narrow room or passage-way. The internal circulation of the boiler is particularly rapid, each corner giving free vertical circulation; the hottest water thus gets quickly away and rapidly returns from the mains, at the same time preventing unequal expansion and contraction. All parts of the boilers are accessible for examination and cleaning out of soot or dust from heating surfaces. These boilers are extensively employed for heating water for general use in hotels and institutions, and, under most trying conditions, for public baths and some of the best known Turkish bath establishments. When required for hot water supply for domestic purposes, public baths, wash-houses, laundries, etc., special cleaning-doors and corner cleaning plugs are fitted, giving access to all waterways for cleaning.



NEW COMPANIES.

The undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C.:—

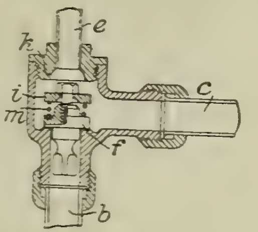
National Wolfram Corporation, Ltd. (143,368). Registered April 11. To purchase, take on lease, etc., mining properties, mines, mining rights, ores, minerals, etc., in Great Britain and elsewhere, and turn same to account, and carry on business of quarrymen, stone merchants, timber merchants, manufacturers of goods of every kind. Nominal capital, £1,000 in 1,000 £1 shares.

Barrett, Bass & Co., Ltd. (143,601). Registered April 14. To carry on business of builders and general contractors, builders' merchants, property repairers and jobbers, painters, glaziers, electrical, mechanical, gas, sanitary, hot water and general engineers, metal workers, paviors, brick and tile manufacturers, cement merchants, dealers in every kind of natural and artificial fuel, land, house and estate agents, auctioneers, etc. Nominal capital, £200 in 200 £1 shares.

SELECTED PATENTS.

21,225 of 1914.—Frederick John Mallett and Charles Alfred Palmer: Water supply; valves.

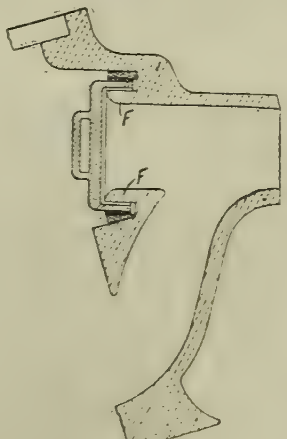
This relates to a combined air inlet or non-return valve for the prevention of contamination of domestic water supply at the outlets or tap nozzles by siphonic action, comprising a lift valve *f* which opens with the water pressure, allowing water to pass from the inlet *b* to the outlet *c*, combined with a co-axial valve *i* which closes the air vent inlet *e*. The valve combination closes normally when the water supply is cut off or fails, thereby preventing the passing back of any fluid from the outlet *c*. In the event, however, of the valve *f* sticking or otherwise failing to close and of siphonic action being set up, the upper valve *i* is forced away from its seating *k* by atmospheric pressure against the action of the spring *m*, so that the supply pipe is vented and the siphonic action is broken.



21,225 of 1914.

22,211 of 1914.—Frank Jones: Drains.

This relates to closures in which a flanged cap bears upon an annular seating, and consists in the provision of an internal collar F to protect the seating during the use of a cleaning-tool.



22,211 of 1914.

List of Competitions, Contracts, etc.

[Surveyor's estimate, £133 15s.]

AUCHTERLESS.—Accepted for additions to dwelling-house, Mains of Hatton, Auchterless, for Mr. Garden A. Duff, Hatton Castle. Mr. W. L. Duncan, architect, Turriff :—

Mains of Hatton.—Mason, P. Christie, jun, Turriff; carpenters, A. & W. Hendry, Wartle; slater, W. J. C. Eddie, Fyvie; plasterer, J. B. Dallas, Turriff; plumbers, C. Duthie & Sons, Turriff. Total, £217 12s.

Addition to Dwelling-house, Lambslack, Auchterless.—Mason, A. Ogston, Fyvie; carpenters, A. & W. Hendry, Wartle; slater, C. Dickie, Turriff; plasterer, J. B. Dallas, Turriff; plumbers, Anderson & Lowe, Turriff. Total, £323.

BEVERLEY.—For erection of a foreman's house and two cottages at the High Eske Farm, near Beverley, for Mrs. Slingsby. Mr. R. H. Whiteing, architect, 3, Ladygate, Beverley. Quantities by Mr. John Watson, Bowalley-lane, Hull :—

G. Pape & Sons	£1,099	18	0
Turner & Sons	1,096	11	2
T. W. Martindale	1,026	9	0
J. Constable, Newbegin, Beverley*	932	14	5

CARDIFF.—For constructing new thoroughfare from St. Mary-street to Westgate-street, for the Corporation. Mr. W. Harpur, M.Inst.C.E., City Engineer :—

M. Parker, jun.	£435	3	8
T. R. Williams	388	15	0
Barnes, Chaplin, & Co.	373	9	7
C. Davies	327	1	0
Lewis Bros., Dinas Powis*	302	8	2

CORK.—For works proposed to be carried out at the nurses' dormitories, for the Committee of Management of the Cork South Infirmary. Mr. J. F. McMullen, M.S.A., architect :—

A. Gaul, Cork*	£239

GUILDFORD.—For erection of a retaining wall for the support of the highway in Quarry-street, Guildford, for the Town Council. Mr. E. Young Harrison, A.M.Inst.C.E., Borough Engineer and Surveyor :—

Reinforced Concrete Wall.

Franks Harris Bros., Station Approach, Guildford*	£674	4	9

LANCASTER.—Accepted for alterations at the confectionery department, Central Buildings, New-street, Lancaster, for the Lancaster and District Co-operative Society, Ltd. Mr. R. Jackson, architect, 32, Market-street, Lancaster :—

Mason: R. Ward, Addcliffe-road	£25	11	0
Joiners: Peill & Riley, Greaves-road	124	15	0
Plumbers: Calvert & Heald, Market-street	82	9	6
Painter: R. Crook, 6A, Brock-street	24	9	0

[All of Lancaster.]

LONDON.—For erecting walling and forming doorways in the basement of C block at their Infirmary, Highgate-hill, for the Guardians of St. Mary, Islington. Mr. E. J. Harrison, architect, 23, Berkeley-road, Crouch End, N. :—

Stevens & Sons	£135	0
T. Mitchell	134	7
Bate Bros.	131	0
H. & E. Lea, Ltd.	125	0
Sprosson & Co.	125	0
Staines & Co.	111	0
W. S. Sharpin	110	0
R. D. Paterson, Ltd.	99	11
L. Town & Co.	97	10
J. E. White & Co.	95	0
Smith & Son	91	0
T. Watson, 92 Hampstead-road, N.W.*	89	0

SHEFFIELD.—For erection of electricity substations, for the Town Council :—

Stanley-Street.

W. Marlow & Sons, Ltd.‡	£1,216

Sidney-Street.

W. Marlow & Sons, Ltd.‡	£1,011

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

L. CX.—No. 3822. MAY 5, 1916.

ARCHITECTURE AT THE ROYAL ACADEMY.

THE present year may be held to fall in the most unfortunate epoch in respect of the conditions under which architectural design is produced which is likely to occur in our generation. We are far enough from the commencement of the to be certain that schemes which were not stopped by its reak have been carried to completion; while we are not iently certain when it will end to prepare for the resumption ull building activity. We have, it is hoped, reached lead point in production, and may look forward to a future in which the dormant chrysalis of architectural gn will be quickened into life—a life more vigorous and hy for the rest given by the laws of circumstance.

t cannot be expected from any profession that the colossal on which the history of nations is being remade, perhaps enturies, can mark a time in which men's creative powers t their best, even if many among our architects were not ling the first duties of patriotism in giving direct national ce to the State. And of those who remain behind few in the mood to dream dreams and visualise solutions for uilding problems which lie before us in the near future.

or these reasons, which react psychologically on all of hether we know it or not, the present exhibition at the lemy is unusually wanting in interest; and, although there many examples of excellent work, there is very little of tanding merit or of great interest. The only large schemes n are those the execution of which depends on the course vents. For example, Mr. Thomas Mawson submits three drawings showing a town-planning scheme for Athens, trating a proposed park system, details of a working-class and a bird's-eye view showing a Governmental centre eived on very ambitious lines. Yet the future of Greece w in the balance, and none of us can say whether she may her way to wider destinies, or has not, on the other hand, ardised what she possesses by her political action.

he well-thought-out proposal of Mr. Barclay Niven, trated by some effective drawings by Mr. Raffles Davison, he removal of the terminus of the South-Eastern Railway e southern side of the river and the planning of a great oach and bridge leading up to it from Charing Cross, is heme which might well be adopted as an appropriate form emorial at the successful termination of a great war, but ld be inappropriate and impossible were the termination e present struggle a costly and inconclusive peace; and so trend of events will not only determine European history will vitally influence the character of architectural problems the localities in which building developments will take e. The Bath Improvement Scheme, which we have trated, is again one of many great projects whose execution t depend on events. Meanwhile the Bath Corporation be congratulated on obtaining the services of Mr. Robert nson, who has produced a design which was only made ible by accurate local knowledge and the use of that ledge by an architect possessing proved ability. It is interesting than most town-planning schemes, for while ost cases the architect only concerns himself with main and general suggestions, Mr. Atkinson has made a careful of the requirements of the buildings to be erected.

n this respect the larger and more ambitious scheme of Barclay Niven and Mr. Raffles Davison for a new Southern terminus, bridge, and approaches is at a certain lvantage, since it would require the services of a great mission, such as has been instituted in many American s. adequately to cope with so immense a problem; but has been shown forms a *précis* or suggestion of the ntages to be gained by the services of such a commission.

nother great town-planning proposal is that dealing with the central part of the City of Oporto, in Portugal, which is illustrated by an excellent model. Mr. Barry Parker shows marked ability in his disposition of masses and a grasp of the fundamental truth that a general Classic feeling is perfectly compatible with marked picturesqueness of treatment. The blocks of buildings, with courtyards open towards the street, which line the axial roadways are delightful in treatment, as are the terminal masses which mark many of the street angles. No other town-planning proposal we have seen gives more promise of architectural success than this does, and we hope it will be carried out in the near future.

Apart from these extensive schemes there is little work shown of architectural size or importance. Sir Aston Webb, R.A., & Sons send in a pleasing view of extensions to the Royal Naval College at Dartmouth,* which form an admirably-proportioned group of buildings, both dignified and simple in treatment. The same architects send a perspective showing a section of the cottages and hall of the Whiteley Homes,* which are very similar to much of Sir Aston Webb's work of a quasi-domestic character. Mr. Ernest Newton exhibits scale elevations of houses on the Sanders Estate* and a design for the Whiteley Homes* (No. 1,694), a well-proportioned example of domestic design.

Mr. Reginald Blomfield's only contribution is a design for a memorial slab to Sir L. Alma-Tadema, O.M., R.A., designed in a scholarly way, in this case especially appropriate. Sir Thomas Graham Jackson is represented by two drawings (Nos. 1,675 and 1,677) which show new buildings in connection with Hertford College, Oxford, as usual indicating the designer's adherence to the precedent which he has followed for so long a term of years. Sir Ernest George sends in a characteristic view of an extension to the crematorium at Golder's Green, rendered in water-colours.

Mr. Richard J. Allison sends two perspectives of buildings for our diplomatists abroad—the British Legation at Cettinjé, suitably designed for its situation and forming an unpretentious and quietly-proportioned square block, and the British Legation at Stockholm, a building equally simple in its main lines, but to which the moulded architraves and dressings of the ground-floor windows give a note of architectural character. Messrs. Percy Adams & Holden exhibit three detailed views of King's College for Women,* which emphasise the admirable architectural quality of their work, suggesting a very pleasing memory of Wren's work at Hampton Court.

The New Board-room for the Metropolitan Water Board, by Mr. Austen Hall,* is hardly up to the quality of the elevations of the offices. "Greek" detail appears to have been a lure to Mr. Hall as to too many of the architects of to-day, who, we are sure, would do better to base their designs on our more traditional and indigenous Renaissance.

One of the largest building schemes exhibited is the University College of South Wales and Monmouthshire, by Mr. W. D. Caröe,* a building designed in a free type of Renaissance and somewhat deficient in the restfulness and dignity which are specially appropriate to large groups of buildings. Those among our architects who have Gothic predilections sometimes fall into this error, while we equally regret the unnecessary formality of others whose work suggests their sympathy with that of the "Greek Revival." But we suppose in all the arts the two types of expression have their value and influence, and determine the mean which it should be our aim to attain to. Mr. J. Theo. Halliday sends a view of his pleasing scheme for Wilmslow Town Hall,* a simple and unaffected example of design, and, in conjunction with his partners, the same architect exhibits a perspective of a picturesque group of five cottages, Bromboro' Port (No. 1,682).*

---

*Illustrated in this issue.

The Bicknell Museum, Bordighera, by Mr. Charles J. Tait (No. 1,734), is a delightfully unaffected and "easy" piece of design of a simple hall with apsidal end and columned front, which comes as a relief after much of the stereotyped architecture of the day which seems the result of undue effort.

Mr. Leonard Stokes' design for Lord Mayor Treloar Cripples' Hospital and College* is a somewhat impressionistic view of what should work out as a well-conceived example of design, but its present form rather awakens interest than satisfies inquiry.

In Blackfriars House, New Bridge-street,* Mr. Francis W. Troup has designed an excellent block of offices, employing the smallest amount of architectural detail to give effect to the composition. Interest is created by the skilful division and grouping of the stories, and, though the suggested detail is not rigidly Classic, Mr. Troup has too much knowledge of style to commit errors in taste or to "invent" detail.

Messrs. Willink & Thicknesse send in a view of the Cunard Building, Liverpool (No. 1,663), an immense and well-proportioned Classical building, depending for character on good fenestration and proportions. We could wish that it had more distinct individuality and charm, and feel that the main entrance might have given scope for a rather more interesting treatment than that adopted. The Midland Agricultural College, by Messrs. Everard, Son, & Pick,* is a well-designed block, treated with a great simplicity and reserve, appropriate to the purpose to which it is devoted. Mr. Arnold Mitchell illustrates his scheme for a Secondary School at Luton (No. 1,687), a good example of design of a very simple scholastic character. Messrs. Gibbs, Flockton, & Teather submit in No. 1,744 a view of the proposed extensions of the University of Sheffield, which take the form of an extension of an existing quadrangle, the variation of levels being dealt with by means of steps. The character of the buildings is Tudor, somewhat marred in effect by the necessity of filling in the window openings with plate glass. It has the appearance of an excellent addition, in which the designers have been somewhat tied by the character of the original buildings.

No. 27, Old Bond-street, by Messrs. Trehearne & Norman, is a design of a Neo-Grec type, shown by a rather hard and unconvincing perspective. The architectural treatment is hardly as original or pleasing as the designers' work at the junction of Kingsway and Aldwych, which we illustrated some time ago. In the New Government Offices for the Dominion of New Zealand (No. 1,749), which we gave some months ago, Messrs. Crickmay & Sons have made a pleasing addition to the architecture of the Strand, which badly needs it. Few recent examples of our street architecture are as successful, and in the design the architects show the manner in which Norman Shaw has influenced our contemporary architecture. The note is welcome among the imitations of French Renaissance and Neo-Grec work which have become so frequent. The entrance of the General Medical Council's building, by Mr. Eustace Frere, suggests the influence of a modified type of l'Art Nouveau, but is simple and carefully thought out. A model of a Memorial Chapel, St. Mary's Cemetery, Kensal Green, by Messrs. Romaine-Walker & Jenkins (No. 1,757), shows a carefully and very correctly designed rendering of Decorated character, which is dignified and refined in character, and should come out well in execution.

We doubt whether the model of Mr. Anning Bell's design for the ceiling of the staircase of the British Museum (No. 1,756) gives as good an idea of effect as a drawing would, even with the aid of the mirror, by means of which the ceiling can be seen with ease; the fact that the walls are only indicated renders the model *qua* model almost useless. It is doubtful whether the treatment adopted is quite Classical enough in character to be fully in accord with the building of which it will form a part.

The year's ecclesiastical work includes a fine interior of St. Mary, Sculcoates, Hull, by Mr. Temple Moore,* and a simple and dignified design for St. Luke's Church, Walsall,* in both of which the architect's reputation as a designer is well maintained, and a very interesting church by Mr. Charles E. Bateman entitled Ward End Church.* It is difficult to give the type of design adopted a name, nor are we quite convinced that the effect of the nave arcade and ceiling would be altogether pleasing, but it is a noticeable and original variant from the customary lines of design, and should for that reason be of interest.

Mr. W. D. Caröe is represented by a pleasing view o Saints' Church, Luton*; the low tower with its roof comp very pleasantly with the body of the church.

Mr. Sidney K. Greenslade submits some magnificent p drawings entitled Studies for a Church (No. 1,738), which characteristic both of his great powers as a draughtsman his originality and skill as a designer. He thinks out prob in design and construction with a thoroughness which productive of originality undreamed of by those who satisfied with commonplace solutions. The design, which shall hope to illustrate at a later date, is distinguished qualities of intricacy, delicacy, and refinement, but we sh have been glad of an interior view, which would enable us b to understand the other drawings. The Lady Lever Memo Christ Church, Port Sunlight, by Messrs. William and S Owen, is shown in a drawing which is one of the finest of Raffles Davison's many drawings; the work is of the Perpendicular type, which seems particularly well suited architecture of a memorial character. Lieutenant W. H Blacking (No. 1,742) sends an interesting study for a Renaiss church, in which the groining of the aisle roofs is carrie detached columns standing out from the wall, which corres to columns attached to the piers of the nave. The cent each of these on the nave side is marked by a pilaster entablature of which is returned on itself. The design, th not wholly satisfactory, is carefully considered and nov treatment. Mr. William A. Pite sends a large view of K College Hospital* and a view of St. Peter's Church Vicarage, Acton Green, W. (No. 1,708), a pleasant examp Italian treatment. The various coloured glass designs s the great attraction that this branch of art has for n promising designers, and it is pleasing to record the ma advance which has been made in the art of recent years.

Among many studies of domestic architecture commercial buildings shown, we will only mention a few o most notable :—Two small banks, one at Esher (No. 1, by Mr. W. Ralph Low, and one at Hitchin by Messrs. Luc Lodge, both of them types of pleasing unaffected wor Georgian type; Messrs. Heal's proposed new pren in Tottenham Court-road, by Messrs. Smith & Brew shown in a perspective which does not do justice to design, as its somewhat flamboyant colouring and execu give a suggestion of l'Art Nouveau to what is in realit simple and reasonable treatment of a commercial fr Nursery Training School, Hampstead, by Messrs. Lovegrov Papworth (Nos. 1,664 and 1,688), is a well grouped proportioned brick building, showing the manner in w architectural effects can be composed by simple means. An houses which may be mentioned are Mr. A. N. Prent delightful Tudor design*; Mr. Sidney Tatchell's Weston A Woodmansterne (No. 1,629); Mr. Skipper's Sennowe gates*; Mr. Stanley Crosbie's No. 1, Buckingham-st Westminster (No. 1,670); a very pleasing and interes design for a house at Enfield, by Messrs. Hart & Waterh (No. 1,671), which is picturesque in the best sense of word. Messrs. G. Unsworth & I. Triggs send some exam of their work, which is as usual characterised by a not old-world picturesqueness; and Messrs. Tubbs, Messer, & Po exhibit a House at Beaulieu,* and Mr. Reginald Poulter Maultway House, Camberley.* Mr. P. Morley-Horder is ha at his best in Mallory Court, Warwickshire (No. 1,668), his house at Minehead (No. 1,684) is a pleasant renderin a well-known type. Mr. Harold Trimnell submits a p drawing of an interesting and dignified house (No. 1,695), Mr. Hatchard Smith a quiet design of a large house conce on pleasing lines (No. 1,685).

As we have said, there is little work of pronounced mer great importance, which is only to be expected considering exceptional period through which we are passing, and the cause for congratulation that so much work of at least ave quality has been produced by architects. We hope that year's Academy may fall in times of peace, when the expon of the arts may come again to their own, and when a w at present distracted and troubled will be able to turr energies once more to the prosecution of those occupat which tend to the prosperity of the nation and to the deve ment of the arts.

---

* Illustrated in this issue.

NOTES.

ilding erations he War.

THE returns received by the Board of Trade from the principal urban districts of the United Kingdom (exclusive of the County of London), giving the estimated cost of the buildings for which plans have been passed in each quarter of the year, afford some ce (if evidence be needed beyond the actual experience of engaged in the trade) of the influence the war has exerted uilding operations. The returns are made by some ninety-six ls with a population of about 12 millions, and this first quarter 6 shows a net decrease in money of £184,096, or 7·4 per cent. pared with the first quarter of 1915. To gain an idea, however, real effects of the war it is necessary to look back to the same r in 1914. In that quarter, from the returns of ninety-five ls, it appears there was a net decrease of £1,775,677, or 44·8 nt., and of this sum the decrease in dwelling-houses represented .170, or 63 per cent. In the past quarter churches, schools, ublic buildings show the highest percentage of decrease, a n occupied by dwelling-houses in the first quarter of 1915, crease being 71·8 per cent., but dwelling-houses came second decrease of 43·9 per cent. At the present time there is employ- or all, and war activities are the first consideration; but when appy day shall arrive when peace is restored the housing on will require most serious consideration. The war has l wages all round, but with falling wages and a diminished the need for suitable dwelling-houses at a reasonable price acutely felt, and it is to be hoped that then the wholly onable system of taxing house property may be entirely and encouragement be given to those who have war savings e them in the investment of house property, a class of investment hich the Legislature has of late years done its best to warn the off. At the close of the war there is also reason to apprehend r check to the provision of adequate dwelling-houses. The uthorities have been exercising economies in every direction the war, and when it is over a great expansion in the rates e expected to make good arrears.

---

llows ition at R.I.B.A.

IT was a happy thought of the Royal Institute of British Architects to make use of its Common Room for the purpose of temporary exhibitions of an architectural character now that the series of portraits of Past-Presidents that usually adorn the re removed to a position of greater security till the end of the war. Members have been compensated for their absence by the opportunity to examine original drawings by Norman Shaw and Nesfield and by a collection of the working drawings of William Burgess for his house in Melbury-road. The latest exhibition now on view consists of a collection of drawings by Charles Edward Mallows, whose premature death last June entailed so serious a loss both to the Institute and to the profession generally. The exhibition is not completely representative, much of his best work not being available for exhibition, but enough is shown to illustrate his marvellous gift both as a draughtsman and as a designer. This is not the time or place to attempt a final estimate of work of such compelling charm. Everyone should make a special point of seeing it for himself.

ROYAL ACADEMY SCULPTURE.

The sculpture section at the Royal Academy this year is almost bound to produce a feeling of depression in the mind of the spectator. It is the most important exhibition of sculpture that is held in England, almost the only one, and therefore it is very difficult to get rid of the idea that it must be representative of British sculpture. And when the examples now on view at the Academy are looked at in this light—as representing the best the nation can produce—that feeling of depression is hard to get rid of. For it must be frankly admitted that there is not even one piece of really outstanding merit to be discovered this year. At any rate, if there is it has escaped our notice. There is a little work which is quite sound and competent, there is much that is passable, and there is more that can only be considered passable if we are in a charitable mood.

Were this the best we could do in sculpture we had almost better give up all hope of an English school and send our students to Paris. For what the exhibition so completely lacks is personality. It is all school work, carried out in imitation of one manner or another, and not as the best expression of the artists' thoughts and ideas, and with nothing whatever about it to indicate that it is English except perhaps that most of it would be rejected at the Salon.

What excuse, then, can we make for British sculpture? In the first place, we can say that the Royal Academy is no longer representative of the nation; that the younger generation will no longer send its work there, very well knowing as a matter of fact that it is far too revolutionary to stand a chance of being exhibited. The selection committee which declined Mr. Havard Thomas's "Lycidas" would not be likely to accept work by Messrs. Epstein or Gill. The Academy in sculpture stands very definitely for the Greek tradition—with French influences. The new school, so far as it admires anything outside itself, favours Assyrian, Egyptian, and Oriental work generally. The two schools have no common ground of understanding, and the communication of ideas between them is limited to abuse. Consequently, whether we are prepared to take the work of the newer schools seriously, or whether we are content with the majority to look upon it all as merely epileptiform and unpleasantly pathological, in either case we must admit that only one side of British sculpture is to be found at the Academy.

Secondly, we can urge that the nation is at war, and that sculpture during war-time is so expensive a hobby as to preclude its practice to all except those who actually have commissions to execute. This line of argument is supported by the many names not to be found in the catalogue, and may in very large measure account for the poor quality of the bulk of the work on show.

For these reasons we decline to admit the adequacy of the present exhibition as a ground for condemning British sculpture, though, on the other hand, we are not quite certain that there are really adequate grounds for supposing that a satisfactory state of things does at present
exist in this country. That, however,
too large a question to enter upon now,
must confine ourselves more closely
Academy.

On entering the central hall, where t
monumental pieces are grouped, we we
afresh, as we have often been before,
thought that it would be of immense
to sculptors if they could have at lea
years' training in an architect's office a
to design satisfactorily in the simpler rec
and cylindrical masses that architects
to employ before beginning to com
far more complex forms and masses
sculpture. We are sure such a trainin
be invaluable to them and would
designs of far greater dignity and si
Possibly Mr. Gilbert Bayes has had

vhat had been tried for had been reached, the result is a thing one would like to have ne's own house—higher praise than could iven to most of the exhibition.

. Bertram Mackennal's marble statue of King in Garter Robes is yet another ple of how apparently inevitable it is that artists become commonplace when they to deal with royalty. They are apparently le to look upon kings and queens in that rsonal way which is so necessary to the ait-painter or sculptor.

No. 1,775, "A Mighty Hunter," Mr. Hodge given us the most delightfully humorous t the same time the most truly decorative ette in the room. It also comes into the catalogue of things we should like to ss.

Thomas Brock's *Titanic* memorial, which ies the position of honour in the room, to us to lack just those qualities which, e said above, an architectural training l almost inevitably give. The composition ghly complex, and is not given strength y really strong basic lines. The contours, re meaningless, and the whole thing fails press because the eye is allowed to wander from one little point of interest to another. rning into the Lecture-room the difficulties asonable criticism are greatly increased. re faced by an enormous array of small ettes, figures of dancers, of animals, rs, children, weeping mothers, and so on. eel that if we had dug these things up anagra, with traces of the old brilliant ring on them, we should have treasured as priceless relics of a past civilisation, vith the inordinate pride of the collector declared them great works of art; but them at the Academy we are fairly ed to know what to say about them. tty knick-knacks" is an old-fashioned e that somehow seems applicable. On hole, perhaps we should be safer not to it ourselves, but to turn to something here we are on surer ground.

at we have in mind is well instanced by ecimens in this room, Nos. 1,853 and 1,881, of which are attempts to design beautiful for objects of everyday use. One is a and the other a garden water-tap; both succeeded. We feel that the bulk of xhibitors who are occupied solely with what is known as "the Ideal Figure" would be far better employed in trying to make the common life of our homes less obtrusively ugly. And we are sure they would find it no easy task to make a decorative kitchen range which, at the same time, would not spoil the cook's temper and the family's digestion. But there is a fortune waiting for the man who can do it

ette: "The Angler." (R.A. Exhibition, 1916.)

A CORRECTION.

We regret that in our description of Grocers' Hall last week we gave the present surveyor's name as Mr. Charles Blomfield instead of Mr. Arthur Blomfield.

LADY KELVIN'S GIFTS TO GLASGOW UNIVERSITY.

It is announced that the late Lady Kelvin has made two notable bequests to Glasgow University, of which her husband was Chancellor at the time of his death. These are (1) £5,000 for promoting research and the teaching of physical science in connection with the Chair of Natural Philosophy, long held by Lord Kelvin; and (2) all the numerous decorations and medals conferred on Lord Kelvin.

THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. XXXI.—St. Mary the Virgin, Aldermanbury.

Like St. Michael, Cornhill, the interior of the church of St. Mary, Aldermanbury, has been divested of all interest by an attempt to replace what originally existed by the travesty of design so dear to the heart of the Gothic Revivalists. The church which formerly stood on the site is recorded as having been in existence in 1181, and is frequently mentioned in records of the thirteenth and fourteenth centuries. It was rebuilt in 1437, and again almost completely reconstructed in 1633, and was one of the City churches which possessed a cloister round the churchyard. The present church was completed by Wren in 1677 and cannot be regarded as among the happiest of his efforts. Corinthian columns divide the nave from the two aisles, and the simple elliptical ceiling of the nave is broken in an unfortunate manner by two enormous clerestory windows. Externally the tower and steeple are somewhat commonplace, and the enormous scrolls on either side of the east window destroy the scale of the building, and modern "decoration" has obliterated original "character."

R.A. ILLUSTRATIONS.

"Blackfriars House," New Bridge Street, E.C.

THIS building, when completed, will form the central offices of Messrs. Spicer Brothers, Ltd., paper manufacturers, who will occupy the lower floors. The five upper floors are planned to be let as general business offices in small or large suites to meet the requirements of tenants. The three main frontages to New Bridge-street, Tudor-street, and William-street are faced with Messrs. Doulton & Co.'s Carrara-ware, partly to enable the fronts to be washed down easily, and partly in order to interfere as little as possible with the light to adjoining property.

The main construction is of steelwork carried out under the Building Act of 1909 for that material, but the floor slabs and staircases are of ferro-concrete. Some further details and description of the building will be given in a later issue. Mr. F. W. Troup, F.R.I.B.A., is the architect.

Whiteley Homes and Hall.

Our illustrations include Messrs. Aston Webb & Sons' contribution to the group of buildings erected under the scheme inaugurated in connection with the bequest of the late William Whiteley.

King's College Hospital.

The view shows the completed lay-out, with the exception that certain blocks can have additional stories added thereto. With the exception of two blocks, the whole of the buildings, including the out-patient departments, are in the occupation of the military authorities, and are known as the 4th London General Hospital.

W. A. Pite.

Premiated Design for Block of Five Cottages, Bromboro' Port, Cheshire.

This block of cottages for Messrs. Lever Brothers received one of the premiums offered in the recent competition, in the group of designs for a block containing five cottages. Each cottage has living-room, scullery, larder, water-closet, and cupboard on the ground floor, and three bedrooms on the first floor. In order to give an interesting outline to the group, the end cottages are planned with the scullery behind the living-room, giving them a bold projection in front of the middle cottages, which are of the "one-room-thick" type. This type has the advantage that the main lighting to the important rooms may be from the front or the back, according to the aspect, and alternative designs were therefore submitted for cottages facing to the north or south respectively. The drawing shows a block to face north, the principal window being at the back. Messrs. Halliday & Paterson and C. G. Agate are the architects.

Proposed Country House.

The plans and quantities of this house were prepared last summer with a view to its erection in the Cotswold district, but owing to the continuance of the war the promoter has since decided to postpone proceeding with the work.

The plan of the house is E-shaped, and is of moderate size. The small garden court, 20 ft. wide, with central porch, represented in the accompanying view, faces west. The main entrance is on the east side, on a central axis with the garden porch, and to the south is placed the hall and drawing-room wing.

The illustration shows the six-light dining-room window on the left, behind which, facing north, is a small extra sitting-room. On the first floor are two large bedrooms and three small ones, a dressing-room and two bathrooms, while in the attics accommodation is provided for maid-servants. The traditional style of the locality has been adopted, and a certain picturesque effect is obtained by the grouping of simple gable forms in the courtyard. Stone slates, building stone, and other local materials are intended to be used.

Mr. A. N. Prentice, of Hastings House, Norfolk-street, Strand, is the architect, who is also the author of the water-colour drawing hung in this year's Royal Academy.

St. Margaret's Church, Ward End, Birmingham.

Ward End was a country hamlet in the parish of Aston when the existing small and cheaply-built church of brick and cement was erected some sixty or seventy years ago. The abnormally rapid growth of the city of Birmingham in this direction has enveloped the district, and now the area is being rapidly covered with works and artisans' dwellings.

As a church cannot be taken down except under an Act of Parliament, and as it was not considered decent for the buildings to fall into decay and the churchyard to become derelict by removal to a new site, the problem of making a large extension upon a small site completely filled with grass added to the difficulties. A reinforced concrete raft appeared the only solution, having regard to objections attending the removal of bodies; and this being determined upon, the scheme provides for converting the existing church into a chancel, the old chancel into a morning chapel, and building a new nave and aisles axially north and south, the timber screen being constructional to carry the old roof and the new gable end.

The materials proposed were Littleton blue lias stone in very thin courses showing the weathered edges, and no dressed stone as usually introduced, the glass being kept in position with small oak frames, Cotswold stone slates, and a plastered interior.

Owing to the war the scheme is held up, and probably the developments of the parish may necessitate converting the existing parish church into a mission church and building a new large church in a more central position.

Chas. E. Bateman.

Proposed Church of St. Luke, Walsall.

This church will accommodate between 500 and 600 people. It will consist of a nave and short north and south aisles, a choir three bays in length, with a clerestory, a chapel on the north side, and a narrow south aisle. The walls will be faced with a local grey limestone, and the roofs slated.

Temple Moore.

Bridge and Island Buildings at Mount Melville, St. Andrews, N.B.

The buildings here illustrated are situated in an artificial lake. The island contains some well-grown forest trees, and as the natural level of the ground surrounding the trees is lower than the water level, the walls and buildings surrounding the island serve to disguise this fact. The bridge is built of stone, the buildings for the main part of brickwork covered with harling. The buildings consist of a summer-house, loggia, boat-house, etc. The general contractors for the building works were Messrs. J. H. White & Sons, of St. Andrews. Mr. Paul Waterhouse is the architect. The design, which is not commented on in our article, is in the Water Colour Room of the Academy.

King's College for Women.

Included in our illustrations are three views of this pleasing and appropriately-designed building, which has been carried out from the designs of Messrs. Adams & Holden.

Clapham Maternity Hospital.

Our illustration shows the main entrance to the new wing recently added to this hospital from the designs of Messrs. A. L. Hart and P. Leslie Waterhouse, 1, Verulam-buildings, W.C. The new building was formally opened in July, 1915, by H.R.H. Princess Henriette, Duchess of Vendôme. At the annual meeting which followed the ceremony Dr. Caroline Sturge, who presided, gave an interesting account of the hospital from its inception in 1887, when the old premises in Jeffreys-road were acquired. Various extensions and improvements were made from time to time, but the Committee had long realised that the pressing needs of the district could only be met by the building of a new block, for which there was ground available. As the result of an appeal to the public funds came in slowly, and it was wisely decided to defer building operations until they could be carried out without incurring a great burden of debt. After sixteen years the hopes of the Committee have been realised, and with the exception of a few hundreds still to pay the buildings are e
free from debt. That this has been p
is due largely to the support received fr
King's Fund, and to some "fairy godmo

TEMPLE MOORE.

New Vicarage for St. Peter's Church, Hampstead, N.W.

THE new Vicarage has been recently erected on a site adjoining that of the church as a memorial to the late Rev. F. W. Tremlett, D.D., D.C.L., first Vicar of the parish (1861-1913). The characterless stucco fronts of the surrounding houses in Belsize-square left a freedom of choice both in style and materials.

The building is executed in multi-coloured red facing bricks, with lead-light casement windows and tiled roofs. A touch of ecclesiastical feeling is introduced into the design of the entrance doorway and the internal screen and hall, which are late Tudor in character. The joinery throughout has been executed in Columbian pine, the hall, staircase, and principal rooms being stained with carbolineum.

The building was carried out by Messrs. Joseph Dorey & Co., of Brentford, at a cost of about £2,500. Mr. George H. Paine is the architect.

◆

OBITUARY.

Mr. G. T. Hine.

It is with regret we have to announce the death of Mr. George Thomas Hine, of 35, Parliament-street, Westminster, who died on April 25 at Fowey, in Cornwall, in his seventy-fifth year. Mr. Hine was the eldest son of the late Thomas Chambers Hine, F.S.A., of Nottingham, with whom he was in partnership until 1891. He was a Fellow of the Institute since 1877, and for some years a member of the Council. After a varied practice with his father he took up the special study of asylum construction. In 1877 he designed the Nottingham Borough Asylum, and in 1887, having won in competition the Claybury Asylum for the London County Council, he removed to London and established himself as a specialist in asylum architecture. In 1901 he read a paper before the Institute. He was later appointed Consulting Architect to H.M. Commissioners in Lunacy for England, which office he held for some twenty years. He designed and completed four of the large asylums for the London County Council, each for 2,000 patients (at a cost of about a third of a million apiece), as well as a number of county and borough asylums throughout the country, such as East Sussex, Worcester, Sunderland, Hertfordshire, Kesteven, Surrey, Gateshead, Hampshire, and Swansea, together with substantial additions at the asylums at Dorchester, Leicester, Nottingham, Moulsford, Wells, Cotford, St. Albans, Devizes, etc. He was a Fellow of the Surveyors' Institution, and an hon. member of the Medico-psychological Society, and a member of other learned societies. In 1909 he took into partnership Mr. H. Carter Pegg, who had been associated with him for over thirty years.

◆

FIFTY YEARS AGO.

New Dock Works, Sunderland.

THE bridge across the Junction Entrance, being the first portion of the work in connection with the new Hendon Dock, was opened on Wednesday, the 25th ult., by the Chairman of the Commissioners of the River Wear. The bridge, which is of iron, is lifted off its supports by means of a hydraulic press; it works on a water-centre beneath the pivot of the bridge; after being lifted about 2 in. it is swung round by means of handles attached to each wheelwork. The total weight is about 100 tons; its length, 110 ft.; span, 60 ft.; its breadth, 12 ft. 6 in.; depth of outside girders in centre, 5 ft. The bridge, on being swung round, worked admirably.

These dock works, which have progressed favourably since the commencement, two years ago, are expected to be ready for opening throughout on October 1 next. They are from the designs and under the direction of Mr. Thomas Meik, the Commissioners' Engineer. Messrs. Sir W. Armstrong & Co., Newcastle, are the contractors for the machinery.

[*_** From the *Builder* of May 5, 1866.—ED.]

GENERAL NEWS.

Daylight Saving.

It is stated that the First Chamber of the Dutch States-General has passed the Daylight Saving Bill, which had previously been approved by the Second Chamber.

The Late Mr. Englefield.

The late Mr. Frederick William Englefield, of Painters' Hall, Little Trinity-lane, E.C., clerk to the Painter-Stainers' Company, registrar of Maidstone County Court, left estate of the value of £11,698.

Royal Institute of British Architects.

A collection of drawings of old work and sketches and designs by the late Charles Edward Mallows, F.R.I.B.A., kindly lent by his widow, is on view in the Common Room of the Royal Institute of British Architects daily from 10 till 6 till further notice.

Manchester Society of Architects.

At a meeting of the members held on the 26th ult., the Report and accounts were approved and adopted, and the following officers and members of Council were elected:—President, Mr. John B. Gass, F.R.I.B.A.; Vice-Presidents—Messrs. A. W. Hennings, A.R.I.B.A., and Edward Hewitt, F.R.I.B.A.; Hon. Secretary, Mr. Isaac Taylor, F.R.I.B.A.; Assistant Hon. Secretary, Mr. J. T. Halliday, A.R.I.B.A.; Members of Council—Messrs. F. B. Dunkerley, C. E. Elcock, H. Q. Farmer, W. C. Hardisty, T. H. Hill, J. A. M. Hunter, P. D. Lodge, A. J. Murgatroyd, Paul Ogden, J. H. Sellers, J. H. Woodhouse, and P. S. Worthington.

War Memorials.

To the April issue of the *Journal* of the Imperial Arts League, Incorporated, Mr. Harold Speed contributes a short article on "War Memorials," in the course of which he expresses the hope that the tasteless things the Jubilee celebrations produced may not be repeated. The article concludes as follows:—"In order to give artists an opportunity of showing what they are capable of doing the Civic Arts Association is organising an exhibition of designs and models for war memorials, and offering prizes, full particulars of which will be published shortly. It is to be hoped that all those capable of undertaking such work will avail themselves of this opportunity. Surely this tremendous time, with all its deep stirring of the national life, should stimulate the country that produced the arts and crafts movement to some memorials worthy of the great things they are to commemorate."

The Architectural Association.

An ordinary general meeting of the Architectural Association was held at No. 37, Great Smith-street, Westminster, S.W., on Monday, at 4.30 p.m., Mr. H. Austen Hall (President) in the chair. The President proposed a vote of sympathy to the relatives of members of the Association who have fallen in the war since the last meeting—Messrs. J. C. Bucknill, Adrian T. Hardman, and G. M. Mackenzie. The motion was carried in silence. The following gentlemen were elected members:—Mr. Arthur Davis, Mr. E. J. Armstrong (19th Battalion Middlesex Regiment). The President announced the following nominations of candidates for the House List for Session 1916-17, and, as no further nominations were forthcoming, they were declared elected:—

President—Mr. A. G. R. Mackenzie.

Vice-Presidents—Messrs. H. M. Fletcher, Stanley Hamp.

Hon. Treasurer—Mr. F. Winton Newman.

Hon. Editor *A.A. Journal*—Mr. F. C. Eden.

Hon. Librarian—Mr. V. T. Hodgson.

Hon. Secretary—Mr. Ralph Knott.

Ordinary Members of Council:—Past-President—Mr. H. Austen Hall; Messrs. Detmar Blow, Alfred Cox, H. Farquharson, E. Stanley Hall, E. Brantwood Maufe, W. G. Newton, W. J. Palmer-Jones, J. Alan Slater, T. Tyrwhitt, Philip E. Webb.

On the motion of the President a vote of thanks was passed to the retiring members of the Council, Messrs. C. C. Brewer and Maurice E. Webb.

CORRESPONDENCE.

Mr. Joseph Pennell and the *Studio*.

Sir,—In your issue of the 21st ult. Mr. Pennell prefaces the statement of his views of the "Wonder of Work" by saying that this statement had been "put before the editors of *Engineering* and the *Studio* and rejected."

So far as the *Studio* is concerned, this allegation is erroneous. Following upon a suggestion made by Mr. Pennell himself, there were negotiations between us for an article embodying his views, and he placed at my disposal certain etchings and lithographs for illustrating it, but no such "statement" as that referred to was "put before" me and therefore was not rejected, and the negotiations fell through solely on the question of the illustrations.

The Editor of the "Studio."

The Wonder of Work.

Sir,—May I answer "A Searcher after Truth" by saying that "it is only the comparatively small number of buildings which" not only "even now," but ever counted? Is there more than one Parthenon, more than one Pantheon? He may think that "the manor house and the small church" just "growed up." I don't. They, too, were evolved, and are, some of them, perfect; but that is, or they are, another story. Certainly I am not trying to reveal anything new, but to point out that great artists are carrying on great traditions.

I never suggested a comparison between Reims and the Vulcan Shipyard. Ruskin probably would. He was "intolerant and indefensible." I hope I am not!

And, finally, after having been all over Germany, I only remember one "great war memorial," the Denkmal at Leipzig, and I think the base, which was the beginning and the end of it, mighty fine. But, as I said to an eminent Teuton, why don't you put a monument or even a top on it?

Joseph Pennell.

Sir,—It is perhaps as well that executive artists are not often beguiled into expressing their views on art generally in the characteristic manner in which Mr. Pennell has done in your issue of a fortnight ago, because, unfortunately, we seldom find high executive ability allied with acute critical faculty, and I fear Mr. Pennell is no exception to the rule.

He claims for the engineers of to-day that they are the great unconscious artists of the time, and that they are doing far finer things than modern architects, the only fault of the engineers being an unworthy attachment to photographs!

If such a claim were admitted, architects might despair, for almost any structure, however hideous, so long as it satisfied some vast commercial need and was boldly conceived, would be sanctioned wherever proposed, and the present chaos of good and bad would be emphasised to an appalling degree. This sheer brute force which crushes us to-day would lay its heavy hand over everything until no prospect ever pleased again.

The Railway Age with its ruthless boldness has already marred many a fine street and city, and the "artists" who did it do not know how well they have done it; but Mr. Pennell does, and no doubt with his magic touch could make fine pictures even of some of the worst wrecks, for the simple reason that the picturesque does not necessarily demand elements which are in themselves artistic. Almost any human operations on a large scale make good subjects for the painter, but that argues nothing. Ruins and slums also satisfy picture-makers because they are full of human interest, and the more muddled they are the better they like them; but these things do not by themselves produce fine cities. There must be purpose and design, not only of each part in itself, but in its relation to the whole. A good illustration of this argument is afforded by our London railway bridges. It appears on good authority that the ones which attract foreign artists are not Waterloo and London Bridges, as might have been expected, but the Charing Cross, Blackfriars, and Cannon-street Railway Bridges, because of their picturesqueness and the violent contrast they make against their magnificent surroundings. The unconscious challenge that they make of hard necessity against every other consideration appeals to artists. But the existence of these blots cannot be defended on any ground whatever. Fortunately, it is no longer necessary to cross a river above it, but, even if it were, in such positions these bridges should have been treated architecturally as viaducts and not allowed to obtrude themselves as they do.

But appearances matter little to the engineer; that is the architect's affair. The Greenwich Generating Station of the London County Council is a case in point. This, on account of its size, if left to the engineer, might have been a monstrous erection; but, fortunately, the architect's skill has saved it.

The confusion of thought involved in Mr. Pennell's contentions is dangerous; it crops up all round. The Whistlerites still shout for the precious Lambeth mud-banks and haphazardness of every kind; and, although I feel myself little qualified to write on the subject, I feel that protest should be made in order, if possible, to define the aims of our future policy. So many have a horror of formalism, but beauty and even picturesqueness are not at all incompatible with communal design so long as free play is given to individual artists to deformalise the formal basis which must first be laid down.

Henry J. Leaning.

National Housing and Town Planning Congress.

Sir,—I have read with interest your report of the National Housing and Town Planning Congress recently held in London, and in view of the difficulty of summarising in one article all that transpired in a four days' Congress I feel sure that you will allow me to draw attention to an important phase of the proceedings which does not appear in your admirable report.

To all who attended that Congress the great question appeared to be, who shall provide the houses which are so urgently needed? The general tenor of the meeting on the opening days was directly and distinctly antagonistic to the private house builder. There appeared to be a definite opinion against him on the part of the gentleman who occupied the chair, and several speakers who advocated building by public authorities spoke in a very disparaging manner of the work of the private builder. I think that my remark, which you report, as to calling the builder "nasty names," did appear quite so drastic after listening to speeches as it would appear after reading summary of the proceedings.

The question of urgent national import is to supply the houses for the people qui and on practical lines. With due res to the opinions of the various representat of public authorities present at the Cong I would submit that to ask the Governm to advance £20,000,000 after the war to su houses which are necessary, and which will £160,000,000, is not either a practical, pos or businesslike manner of facing the ques In the first place, £20,000,000 will be a sum to ask the Government for at the clo the war; in the second place, it is mere fraction of the amount required; in the place, the public authorities cannot build h on economic lines in competition with private builder; and last, but most impor if the public authorities compete with pr enterprise by building houses and letting at a loss they will drive the private bu out of business and have to deal with the problem of spending about £50,000,000 annum on the housing of the people.

I think the advocates of private enter brought these points clearly before the Con for it was eventually admitted from the that, as public authorities have only 12,000 houses, private enterprise must be lo to for the solution of the problem. The anachronism of the Congress seemed to the fact that while it was admitted that pr enterprise was indispensable, yet the Con is asking for a subsidy from the Governme enable public bodies to compete with pr builders in a ruinous competition.

But merely destructive criticism is of n in the discussion of this or any other que and I would not write you now if I di believe the solution of the housing pro to be both possible and feasible. The reason why the private house-builder has c to build and why the country is confro with a gigantic problem is that the tre legislation—commencing with the Finance (1909) and terminating with the Increa Rents, etc., Act (1915)—has been towards ing the position of the private builder impos The public speeches of responsible men again and again aimed at the private own of property, until now it would appear almost a disgrace to be the landlord of co property. If this deplorable conditio affairs can be set right, and house pro be once again brought into favour as an in ment, one main factor in the housing pro will have been solved.

The remedy is in the hands of the pr builder and the private investor, his cust who in the past has invested many mi sterling every year in providing homes fo people, and if the Government will app the matter from that point of view this dif problem will be found to be solvable o ordinary commercial basis.

Norman McKellen,
Secretary, Manchester and Di
House Builders' Associatio

their number.

this spirit of supplying the public with
wants. with what tickles its palate
putting a strain on its intellect, has
nspicuous at the Academy for many years.
. of course, nothing particularly immoral
is; it is no better and no worse than any
ethod of skilled trading. The only pity
the official headquarters of British
painting should encourage so much of that sort of thing as to make the man in the street think that it is what those who really know call "Art." He takes their word for it, and goes away thinking that art is a pretty and amusing toy, but not to be taken seriously by grown men.

There must be many thousands of Englishmen and women who never see a fresh picture from year's end to year's end except for their annual pilgrimage to the Academy. And what does the Academy do for these people? Does it do anything at all to train their eyes to a keener appreciation of beauty? Does it send them away the better for having experienced an æsthetic emotion? We are afraid the answer is "in the negative." The Academy assaults the eye of the visitor with a hundred or more garish mediocrities in glittering gilt frames filling the wall-space from floor to ceiling. Girding up his loins, he boldly attacks the pictures in the first room, making a pencil-mark in his catalogue against anything he likes. With a final hasty glance through the catalogue to see if there are any names he knows, he hurries to the second room, where the process is repeated. In the third room he takes it for granted that the Hanging Committee have done their work properly and that he need not look anywhere but "on the line." By the time he reaches the fourth room his headache has begun, someone steps on his toe, he finds the available seating accommodation is more than fully occupied, and he hurriedly leaves the place neither a better nor a wiser man, needing indeed only the accident of chance to turn him from a potential to an actual criminal. And all this because the Academy for some unfathomable reason will not raise its standard and exclude half, or even three-quarters, of what it at present accepts. There is plenty of sound work at the Academy—there always is—but it is not easy to find, and no man living can look separately and intelligently at 1,612 pictures in one day, or even in a week.

And, of course, the more blatant pictures that spring to the eye are in most cases by no means the best. The finest portrait in the exhibition, for instance, is a very quiet affair, a harmony of subdued black and gold, beautifully balanced, with a quality of paint quite unusually good. This is in the first gallery, and may profitably be compared with the several other portraits which are there—good stock work, but looking strangely uninspired beside Mr. Lavery's fine study of Sir Charles Cheers Wakefield (No. 18). This is not to say that Mr. Arthur Hacker's portrait of the President of the Institute or George Henry's "Sir Perceval Nairne" may not be legitimately admired as sound craftsmanship and adequate likenesses; but Mr. Lavery's work gives us something that they do not, because it has an interest quite apart from, and in addition to, its subject.

One of Mr. Brangwyn's large decorative canvases is hung in this room, and, like most of his work, challenges immediate attention. That it has great merit goes without saying, but there is about it a certain coarseness of execution which, for us at least, robs the picture of much of the delight we should otherwise derive from it. The big tree in the foreground, for instance, is drawn all in one vertical plane. There is no sense of growth about it, no life; it is merely a system of radiating bands which serve simply to pull the composition together. And, in spite of this summary method of treatment, the various planes of the picture are not distinct. The sky is as near as the house, and the tree is plastered against the house. In a word there is no atmosphere, and with the loss of atmosphere goes a great part of the charm of most landscapes. Even the great Chinese painters, treating landscape on far more rigidly conventional lines than Mr. Brangwyn does, have generally given a wonderful sense of atmosphere. But, in spite of its lack of space and distance, the picture is a good one, because it has coherent design both of line and colour.

We do not as a rule make a practice of calling attention to works which seem to us fundamentally wrong, and it is perhaps bad taste to attack individual painters; but No. 43, in addition to its technical shortcomings. seems to us to sum up so well what we have been saying about commercial art, and is such an obvious example of the insincerity and sentimentality which must always accompany attempts to produce art to please tastes other than the painter's, that we could not help mentioning it. It will, however, probably be one of the most popular pictures of the year.

There are several pleasant landscapes in this room, particularly No. 6, by Mr. Adrian Stokes, and No. 55, by Mr. Hughes-Stanton—the latter familiar enough in style and subject, but the former quite unusual in many ways and justifying the quotation which the artist has inserted in the catalogue:—

> It is a shaggy world, and yet studded with gardens.—
> B. L. S.

Passing on to the second room, the first picture that calls for mention is No. 65, "The Nativity Morning," by Mr. Cadogan Cowper. This painter has attained an extraordinary degree of skill in the rendering of textures that rivals the Flemish masters. He can paint you silks or satins of which any woman could tell the price per yard. In this case he has applied his talents to a religious subject, but we cannot feel that he has thereby added anything of value. The composition is practically the ordinary stock Italian design—Madonna in the middle, a vista of country seen on either side of her, and dark architectural features running up the sides of the picture. Mr. Cowper's design, in fact, challenges comparison with the art of Raphael, and naturally enough does not get the best of things. His Madonna is only a very ordinary little girl, pretty enough, but obviously much more at home on the lid of a chocolate-box than where Mr. Cowper has put her. This painter will have to look to his laurels, too, for close by, No. 69, is another picture quite in his own style, and quite as

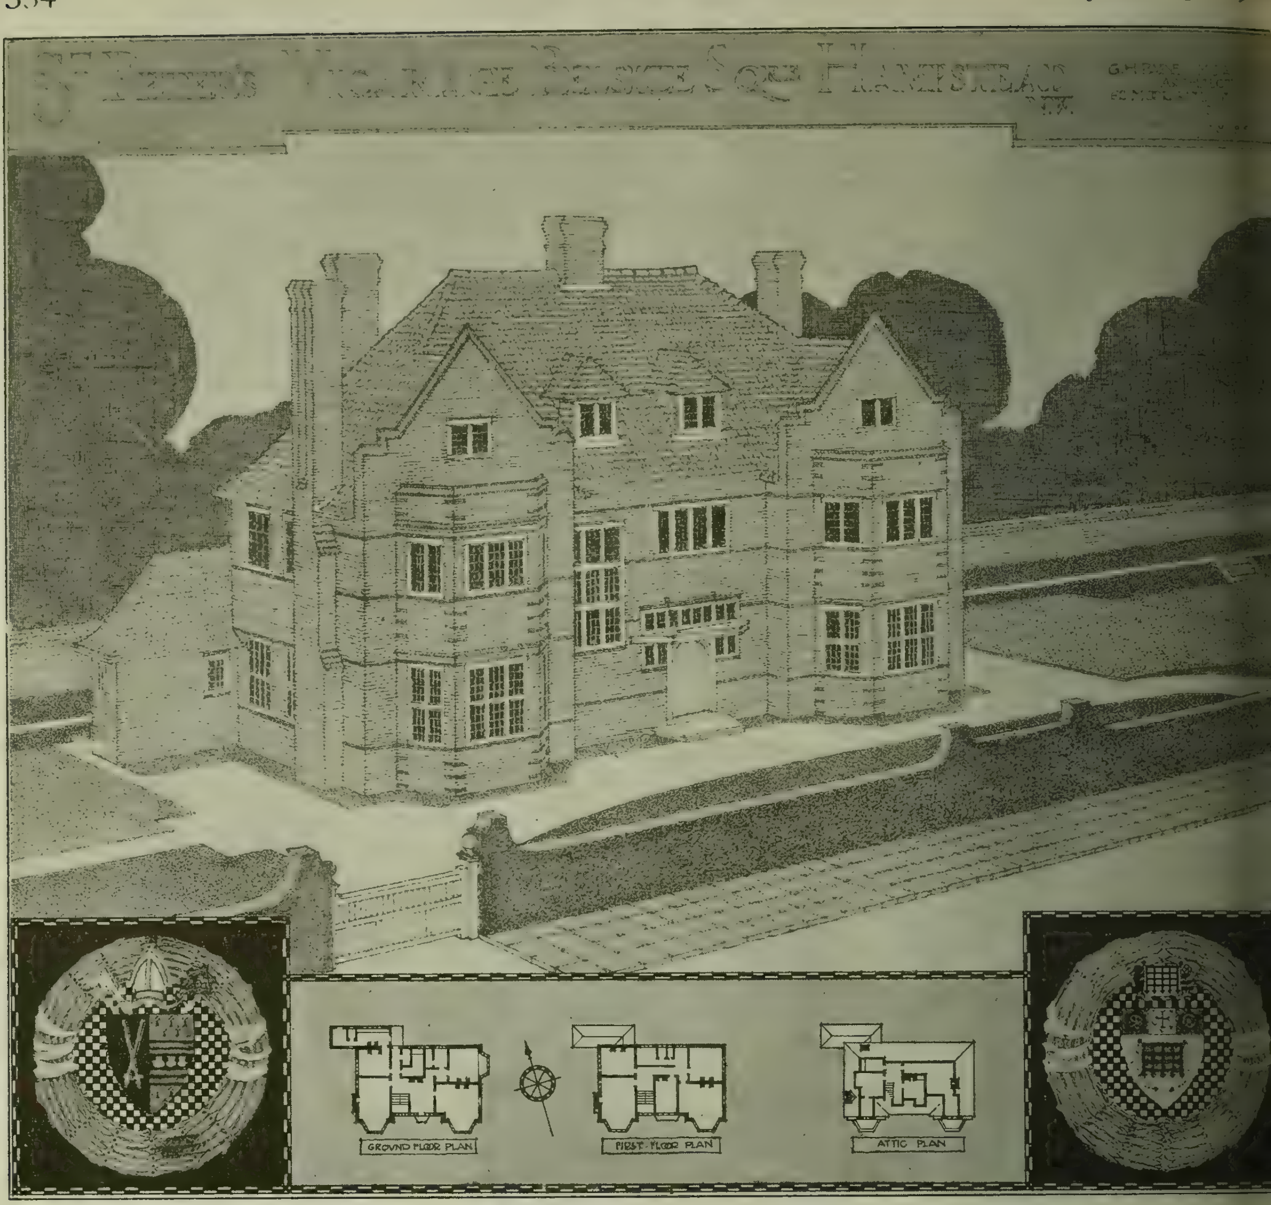
St. Mary's, Sculcoates, Hull. (R.A. Exhibition, 1916.)

Mr. Temple Moore, Architect



Royal Academy Exhibition, 1916.

successful in its rendering of intricate detail and surface accidents.

Mr. Harold Speed's portrait of H.M. King Albert of Belgium is a creditable attempt to make a king look more dignified than the ordinary run of men; but he should not attempt tricks of artificial lighting in open-air subjects unless, of course, they are skilfully concealed.

In this room also hangs another large design of Mr. Brangwyn's, the "Mater Dolorosa Belgica," a little obvious in design and melodramatic in effect. Not quite as good as the best of Raemaeker's cartoons (which, on a larger scale, is what it really is), but certainly one of the best English attempts to sympathise in terms of paint with that unfortunate nation. In this design, as in the Provençal composition in the first room, the effect is somewhat spoiled by coarseness of drawing. The black outline of the central figure, for instance, is curiously insensitive to the forms which it encloses. Mr. Brangwyn's third picture, No. 447, is perhaps the best thing he is showing this year. Out of very unpromising-looking material he has made a mosaic of beautiful but subdued colour, focused in one small rectangular piece of glowing vermilion. Altogether a really masterly bit of work.

Mr. Clausen has three pictures hung this year—a study of a girl's head (No. 945), which, though beautifully drawn, will probably not attract much attention; a picture of the interior of a barn, a favourite subject of his, but this specimen is one of the best we have seen, the figures being drawn with real force and vigour, but at the same time subordinated to the general design, so that in spite of their being so full of action they do not strike the eye first when one comes upon the picture.

But it is the third of this artist's works which impressed us most. It is called "Youth Mourning," and, though it is not obviously connected with the war, it somehow suggests very forcibly, but without bitterness, the sadness and sense of loss that must always follow strife. There is nothing in the picture but a girl's figure in the foreground, the head bowed down to the earth, and some white crosses in the background which fades away into indefinite mist. As simple a picture as could be conceived, and yet we venture to predict that few will look at it unmoved. Exactly why that particular arrangement of lines and forms should give the spectator emotion is a problem that defies analysis. All we can say with certainty is that the artist has expressed an emotion he really felt, and that if he had not sincerely experienced that emotion he could not have passed it on to us.

Mr. Orpen is another exhibitor who cannot fail to attract attention. He is one of the few modern English painters for whom technical difficulties can scarcely be said to exist. It is perfectly obvious from his work that the rendering in paint of the intricate modelling of a head presents for him few difficulties, and he obtains what he wants without having worried the paint into a heavy dull mass as so many of his less-gifted brethren are apt to do. But this should be enough for him. It was surely not necessary for him to paint a girl in a pale pink dress on a solid black background. True, the result is so striking that no one
who goes into the room can miss it, bu
solidity of the background makes the

LEGAL SECTION.

TES ON CURRENT CASES.

kmen's Compensation—Street Accidents.

HE decisions under the Workmen's Compensation Act may well seem incomprehensible to the layman. In ssue for March 31 we reported a case a man employed as a plumber's mate njured by collision with a motor-car whilst a bicycle in the street. At the time accident he was riding a bicycle belonging employers, and the evidence was that s habitually employed to do so on the business once a day. The arbitrator ound that the accident did not arise out of n the course of his employment, and had for the employers. The Court of Appeal d to disturb this finding on the ground t was a finding of fact which there was nce to support. Mr. Justice Sargant, rer, who formed one of the Court of Appeal, ssed some doubt as to whether it was not a question of law and fact.

days later the court similarly constituted pefore it a case Read *v.* Baker (*Weekly* April 1), in which a solicitor's clerk, once a week on his employer's business o attend a court ten miles distant, and was permitted to perform the journey by train or on his bicycle, was killed llision with a motor lorry whilst return- the office. In this case the arbitrator had that the accident arose out of the man's oyment, and had awarded his dependant ensation. The Court of Appeal set this l aside. The use of the bicycle being in ase permissive would seem at first sight tinction between the two cases; but the appears not to have relied upon this ction, since, according to the report, imated that it must not be assumed that esult would not have been the same even e employer had directed the man to use cycle.

fore considering the reason why these men not considered as entitled to compensation r the Act, we may point out that it is isfactory to find a case upheld in one nce on the ground that there is no power e Court of Appeal to disturb the finding ct, whilst in another case where the facts nearly similar the court below is reversed. me cases it is a pure question of fact, and, urse, then there is no appeal; but the e of Lords, in a case reported since these ions in the Court of Appeal (Herbert el *v.* Fox & Co., 1916, A. C. 405), have Lord Atkinson made some valuable com- s on the duties of arbitrators to find the as distinct from the law, and his Lordship intimated that the determination of the tion whether an accident arose out of the re of the workman's employment as well e question as to what the sphere of that oyment is are questions of law. It inly would assist arbitrators and secure rmity in their decisions and thus obviate necessity for litigation if the appellate s, treating such questions as mixed tions of law and fact, could lay down ral principles.

w in Read *v.* Baker the Court of Appeal that there was no ground for the suggestion a bicycle was such a dangerous article that ermitted user should make an employer for an accident on the road.

in the Act of 1916, there is no limit of ity within which the accident must happen, as the case in the original Act. It is more ult to determine an employer's liability e he sends an employee off his premises is business; but the principle adopted in the ish courts seems to be that if when sent n errand he runs no more risk than any ber of the public, then if an accident ens it does not arise "out of" the employ- t. The above cases illustrate this proposi- and they should be compared with another Pierce *v.* Provident Clothing and Supply pany, Ltd. ([1911] 1 K. B. 997), which was distinguished from Read *v.* Baker by the Court of Appeal. There a man who was employed as a canvasser and collector was killed in the street whilst riding his bicycle with the permission of his employers. The Court of Appeal, reversing the finding of the arbitrator, awarded compensation on the ground that as his employment took him in the streets more than other people the risk of street accidents became an incident of his employment. The principle is illustrated by another recent decision, Chapman *v.* Owner of the ship *John W. Pearn* (March 15, 1916), where the master of the ship, whilst ashore on ship's business, had slipped on a piece of orange peel, and the Court of Appeal held that the employment rendered him no more liable to this risk than any member of the public. We may also instance the case of railway travelling. If a man in the course of his employment has to make occasional railway journeys he runs no risk specially connected with his employment, but it is otherwise if he is engaged in railway work.

The above principle has been adopted in the English courts, but the Scotch Court of Session has taken a different and possibly a more logical view. Thus in the case Bett *v.* Hughes (8 B.W. C. 363) the principle was criticised as introducing a new element of uncertainty in raising the question of frequency with which the risk has to be run. In that case the injured man was a coachman who, when his mistress was in residence, was required every evening to go to a post-office for letters, and was permitted to use his bicycle. The Court of Session awarded him compensation, and in considering the above principle asked how often it was alleged he would have to go to bring him within the Act. The court also pointed out that if in his capacity as coachman he had been required to drive to the post-office and had met with a similar accident he would undoubtedly be within the Act.

This court has, however, no authority to bind the Court of Appeal by its decision, so pending a decision on the point by the House of Lords the law in England appears to be as we have stated it.

Reverting to the case of the plumber's mate (Dennis *v.* A. J. White & Co.), we may, however, point out that even an occasional errand in the streets may involve some special risk connected with the employment. Thus it is not uncommon to see a builder's workman riding a bicycle carrying a plank or some other unwieldy article. If this is done under the employer's orders, or even with his permission, and the workman meets with an accident, it may well follow from the principles indicated above that this would be held to import an unusual element of risk and that the man could recover compensation.

The Increase of Rent and Mortgage Interest Act.

In the case of Welby *v.* Parker, reported briefly in the *Weekly Notes* for April 8, an important point was decided by the Court of Appeal under the Increase of Rent and Mortgage Interest (War Restrictions) Act, 1915.

There seems to have been no question that the mortgage the subject of the action was one to which the Act would apply if the statute was retrospective, the sole question being whether sect. 1 (4) was retrospective.

The mortgage was made on March 5, 1910, the mortgage money being repayable six months later in accordance with the usual form. In June, 1914, the plaintiff, the mortgagee, and the defendant, the mortgagor, served cross notices upon each other for the payment off of the mortgage, but the mortgage was not paid off, and on July 15, 1915, the plaintiff issued a writ to enforce his security by foreclosure or sale. On November 3 he took out a summons for an order *nisi*, which was adjourned to February 28, 1916, when the judge in chambers refused to make the order, and this was an appeal from his refusal.

Sect. 1 (4) provides that it shall not be lawful for any mortgagee under a mortgage to which this Act applies, during the continuance of the Act, and so long as interest at the standard rate is paid and is not more than twenty-one days in arrear, and the covenants by the mortgagor are performed, and so long as the mortgagor keeps the property in a proper state of repair and pays all interest and instalments of principal recoverable under any prior encumbrance, to call in his mortgage or to take any steps for exercising any right of foreclosure or sale or for otherwise enforcing his security.

The Court of Appeal held that the Act did not take away any rights, but merely suspended a remedy, and therefore, as it related merely to procedure, might operate retrospectively, and that both attending on the summons and giving notice of the appeal were "steps taken" in the proceedings.

We have already in a former issue (April 21) shown the extraordinary results of the Act in Lord Bute's case, and that it prevents even a long lease being granted of properties within the Act to a person who was not a tenant and had no other connection with the lessee. The case under consideration has not such drastic results, but nevertheless illustrates the arbitrailry character of the Act. The money was advanced on this small kind of property four and a half years before war broke out; both parties had shown some intention of terminating the loan two months before the war was declared, but the mortgagee, not having taken actual steps to enforce his security until six months before the Act in question was passed, finds himself unable to do so for the duration of the war and for six months afterwards. Many of the persons who have advanced money on this class of property must be in a position in which it is extremely inconvenient, if not serious, to have the money they have advanced locked up, especially in war-time. These two decisions under the Act show what an extremely ill-devised measure it is. When the Bill was introduced we suggested that the proper way of dealing with the matter was by setting up tribunals which could grant relief in any proved case of hardship. The Bill was innocuous as compared with the Act, in which Parliament appears to have lost sight of the original intention of the legislation, and as is now proved it is an absurd measure resulting in fettering and prejudicing certain interests without enabling any inquiry being made as to the circumstances of each case, but purely arbitrarily. In many cases the landlord and mortgagee will be placed in serious difficulties, whilst the tenant and mortgagor require no relief; and, as was shown in Lord Bute's case, sometimes the tenants will also suffer. A person requiring an advance on his property will be unable to obtain it, and building operations will be put an end to. We can only liken the effects of this sort of remedial legislation to the case of the police-constable who, seeing a struggle taking place, arrests the person who has been robbed and releases the thief.

Alien Enemies as Tenants.

Some interesting points in connection with litigation against and by alien enemies who are tenants were decided in the case Halsey and Another *v.* Lowenfeld, Leigh and Curzon, third parties ([1916] 1 K. B. 143). The plaintiffs were assignees of the lessor's interest in the Prince of Wales's Theatre, which had been let in 1895 to the defendant, who was an Austrian subject, an alien enemy. The lease was for twenty-four years at a yearly rent of £6,000, payable in monthly instalments of £500. A sum had been deposited by the defendant as security for the payment of the rent and the performance of the covenants in the lease, and the lease provided that this deposit should be returned by deductions from the rent in the last seven years of the tenancy. The last seven years commenced at Christmas, 1912.

The defendant had assigned the benefit of the lease, and the assignee had covenanted to indemnify the defendant against liability for rent. There had been subsequent assignments and the third parties were sub-lessees.

The action was brought in respect of three months' rent, and the defendant had given notice that he would counterclaim in respect of sums which he alleged should be allowed out of the deposit. He also had served third-party notices, claiming from the assignees under their indemnity.

One of the first points raised in the case was that an alien enemy could not, during the continuance of the war, be sued where the cause of action (in this case the rent falling due) had not accrued until after the war began.

This was an attempt to distinguish the case from the decision of the Court of Appeal in Porter *v.* Freudenberg, in which case it was decided that an alien enemy could be sued for rent which had accrued due before the war began; but the court held that no authority could be found for this distinction. It was therefore held that the defendant could be sued for the rent which became due in June, July, and August, 1915, and it was also held, on the authority of the same case, Porter *v.* Freudenberg ([1915] 1 K. B. 857), that the defendant could, if sued, counterclaim; but the court held that an alien enemy could not take third-party proceedings. Third-party proceedings, although necessary for the presentment of the defendant's whole case, so far as his personal liability is concerned, are independent of the defence to the plaintiff's claim, and they were held to come within the principle laid down in Porter *v.* Freudenberg, that after hostilities have commenced an alien enemy cannot be heard in any suit or proceeding in which he is the person first setting the court in motion. The case is very instructive, as it deals with every point that can arise in actions where alien enemies are sued in connection with the relationship of landlord and tenant.

Whilst we are dealing with this question of alien enemies as tenants we may also draw our readers' attention to another point which was raised in the case London and Northern Estates Company *v.* Schlesinger ([1916] 1 K. B. 20).

In this case the defendant, also an Austrian subject, had taken a flat at Westcliffe-on-Sea for a term of three years from Lady Day, 1914. The agreement contained a provision that the tenant should occupy the rooms and not assign or under-let without obtaining the consent in writing of the landlord, which consent should not unreasonably be withheld.

After the war broke out the Aliens Restriction Orders came into force, which prevented alien enemies residing in prohibited areas, of which Westcliffe-on-Sea is one. The action was brought to recover one quarter's rent due on Lady Day, 1915. The defence was that the Order in Council had had the effect of determining the tenancy.

This contention was based on the case of Krell *v.* Henry ([1903] 2 K. B. 740), one of the cases where a room had been taken with the object of witnessing the procession at the Coronation of the late King, which procession, owing to His Majesty's illness, never took place, and the lessor was held not entitled to recover the balance of the rent which had not been paid before the day. The court distinguished that decision on the ground that in that case the foundation of the contract was the taking place of the procession; but that this was not the case here, since the personal occupation of the premises was not the basis of the contract, for the lessee could sublet, subject to certain conditions, or he could lend them to a friend. It must also be noted that Mr. Justice Lush also questioned whether a tenancy could be treated as a contract and nothing more, so that the same principles should be applied to tenancies and to contracts.

A RUPERT BROOKE MEMORIAL.

It has been decided to set in Rugby Chapel a memorial of Rupert Brooke. It will take the form of a portrait medallion in marble, based on a photograph by Sherril Schell, which appears as the frontispiece of the 1914 volume of poems. The medallion will be the work of Professor J. Havard Thomas.

LAW REPORTS.

COURT OF APPEAL.

(Before Lords Justices SWINFEN EADY, PICKFORD, and BANKES.)

Engineer's Action against Builders: Elliott *v.* C. P. Roberts & Co., Ltd.

IN this case the plaintiff, Mr. Sidney Elliott, a hot-water engineer and fitter, of Stepney, E., appealed from a judgment of Mr. Justice Lush in favour of the defendants, Messrs. C. P. Roberts & Co., Ltd., builders, of Tyssen-street, Dalston-lane.

The plaintiff brought the action to recover damages for personal injuries sustained by him owing to the alleged negligence of the defendants or their servants.

It appeared that the defendants had entered into a contract with the L.C.C. to rebuild a school in Bethnal Green. Under the terms of the contract the defendants were to provide the necessary plant, etc., and to afford facilities for other tradesmen employed by the L.C.C., including the reasonable use of the scaffolding. Defendants had control of the premises and plant. On December 21, 1914, plaintiff, whilst lawfully engaged on the building (though he did not allege that he was employed by the defendants or made any contract with them), when walking across a gangway, which consisted of two planks placed diagonally across an open space, not fixed on either side and having no fence or railing, fell, the boards falling with him, with the result that he sustained serious injuries, and afterwards became paralysed. The gangway in question had been safely used by workmen for three months, and the plaintiff, prior to the accident, had used it for six weeks.

Defendants denied liability, alleging that there had been no negligence by them or their servants and agents.

At the trial the jury returned a verdict for the plaintiff, assessing the damages at £2,000; but Mr. Justice Lush, after hearing arguments, entered judgment for the defendants with costs. His Lordship said, although it was true that the defendants had agreed with the L.C.C. to allow other tradesmen to use the gangway, he did not see how a stranger to a contract could take advantage of it. If the defendants refused to permit the use of the gangway they would be exposed to a claim from the L.C.C., and to no one else. His Lordship came to the conclusion that the plaintiff, being a bare licensee, he could not succeed unless he could prove that the defendants were under a duty under a contract to provide safety. He held, therefore, that there was no breach of duty on the part of the defendants, and entered judgment as before stated. From this decision the plaintiff now appealed upon the ground that the learned Judge should have entered judgment in accordance with the verdict.

Defendants also entered a cross appeal, asking that, in the event of the plaintiff succeeding, there should be a new trial granted upon the grounds that the verdict of the jury was against the weight of the evidence, and that the damages awarded the plaintiff were excessive.

Mr. J. W. Moyses and Mr. A. Davies appeared for the appellant (the plaintiff), and Mr. McCall, K.C., and Mr. Craig Henderson for the respondents (the defendants).

Lord Justice Swinfen Eady, in delivering judgment on the 19th ult., having stated the facts, said he was of opinion that the plaintiff in regard to the use of the gangway was in the position of an invitee so far as the defendants were concerned, and was not in the position, as Mr. Justice Lush had held, of a mere licensee. His Lordship thought further that, as the matters relied upon by the plaintiff as negligence, namely, that the planks were not fixed and the gangway had no handrail, were facts which were obvious to anyone, the defendants had committed no breach of duty towards the plaintiff. He, however, expressed the opinion that the gangway, from the nature of its construction, required inspection and adjustment from time to time in order to see that the boards did not slip, and there was evidence on which the jury might have come to the conclusion that the plaintiff's accident was due to the failure of the defendants to examine and adjust the boards. For these reasons he thought the trial was unsatisfactory. In the circumstances he felt it was impossible to allow the plaintiff to retain the verdict of the jury, and it was also equally impossible to uphold the judgment which had been entered against him, and to say that there was no evidence on which he might have recovered. The result would be that both the verdict of
the jury and the judgment entered again
plaintiff must be set aside, and there mu
a new trial.

His Lordship also added that, althoug
sum awarded by the jury to the plainti
a large one, having regard to his positi
life, he would not, on the ground o
amount of the damages alone, have see
way to order a new trial; but as a new
had been ordered upon other ground
opportunity would be given for a fresh
sideration and assessment of the dama

Lords Justices Pickford and B
delivered judgments to the same effect.

The costs of both parties of the appea
of the first trial were ordered to abid
result of the second trial.

architect replied that the contractors'
nent that £1,000 was due was "sheer
nse." After further correspondence the
ctors gave the architect notice that unless
had a satisfactory reply from him they
stop work. A contractor who was kept
of so much money could not be expected
on. On July 10, 1913, a certificate for
only was given, "as a concession" and
ut prejudice to the defendants' rights
the contract. Appeals for further pay-
were made by the contractors, but the
ect did not give a certificate, stating that
progress is disgraceful." That was sent
postcard. In a letter in August the archi-
spoke of "interminable delay," and on
t 29, at a meeting of the Building Com-
, the architect was instructed to write to the contractors, requiring them to proceed with the work with reasonable despatch, and giving notice that failing compliance the contract would be determined. At the time of the notice the contractors had been underpaid to the extent of £762 13s. 5d. In September, 1913, the plaintiffs received a cheque for £200 on account. The defence alleged that the contractors abandoned the work. There was no abandonment, as the work proceeded, though slowly, during September. Subsequently to the certificate for the £200 the architect wrote stating that that sum included the price of all the unfixed materials on the site. Plaintiffs wrote stating that they were entitled to considerably more than they had received. After ousting the contractors the Committee completed the work on May 30, 1914, taking eight months to do it. The cost to them was £944, compared with the contract figure of £820.

[*** The conclusion of this report will be given in our next issue.—Ed.]

EFFECT OF WAR ON ROADS.

The report of the Roads Improvement Association stated that, owing to the restriction of road expenditure, the heavy military traffic, and the unfavourable weather, "the roads throughout the country have seriously deteriorated, and no systematic or extensive improvement can at present be expected. It was unfortunate that the Government found it necessary to appropriate the Road Board's income for war purposes. The Association had urged that the fullest advantage be taken of the existing funds to keep the roads in as good a state as possible, and at a suitable opportunity steps would be taken to impress upon the Government the need to restore the whole of the diverted income quickly, as generous State assistance for the roads would be imperative in the future.

THE BUILDING TRADE.

THE REBUILDING OF BELGIUM.

The following paragraphs, which appeared in the daily papers a few months ago, give a faint idea of the work which will have to be done in Belgium when peace is declared:—

"The Belgian Government has compiled statistics as to the destruction wrought by the German army in Belgium.

The total number of houses and public buildings destroyed is 18,207, and details with regard to Flanders (two provinces), Limburg, Hainaut, and Luxemburg are lacking.

The destruction was most complete at Spontin (province of Namur), where 127 out of 130 houses were burnt to the ground, and at Dinant 1,263 out of 1,375. At Louvain, 1,120 out of 7,433 houses were destroyed, while 1,000 were pillaged."

Out of nine provinces of which Belgium is made up there are five from which no details can be obtained, two of which, Flanders and Hainaut, are thickly populated, especially the latter.

In Flanders we have seen the town of Termonde entirely destroyed, and Alost partly destroyed; while since our stand at the Yser all that region has suffered terribly. For many months the town of Nieuport has been bombarded every day with the heaviest German projectiles. This town is completely levelled, as though some huge steam-hammer had crushed the buildings to the ground. Even the foundations are reduced to atoms.

A single one of these projectiles, falling in the Grand Place, which is paved with blocks of stone, made a crater 7 ft. deep and about 10 yds. square, while each piece of pavement became another projectile to be dashed against the houses surrounding the Place, large as it was. Thus one can judge of the effect of one of these bombs on a building, and they have been falling like this for months. Furnes has also been constantly bombarded, but by less powerful guns; in spite of that, though, a great part of the town has been destroyed. And what can we say of Ypres? It must look like Nieuport.

It is certain that for a space of five miles on either side of the actual line of fire all the towns and villages have been systematically destroyed, and thus for a distance of about fifty miles, if we only speak of the Belgian frontier. Thus it is evident that the estimate of 18,207 houses destroyed in Belgian territory must be considerably below the real figures.

And if we leave Belgian territory to pass along the French line of fire, which only ends at the Swiss frontier, think of the tremendous destruction of buildings which has taken place on this other front, some hundreds of miles in length and varying in width from ten to fifteen and sometimes twenty miles.

Then, again, will the firing line always be in the same place? It seems doubtful unless peace is arranged before there is a general offensive in the West.

In considering the possibility of a German retreat as the result of an offensive, it is apparent that the successive stands will multiply tenfold, perhaps a hundredfold, the damage already done to our country, since unfortunately they must all be made in Belgium.

Then if we turn from the consideration of this fearful devastation, which it is not yet possible to estimate properly, and try to imagine the ruined towns and villages on the other fronts, in Poland, in Galicia, in Russia, in the Balkans, we give up any attempt to calculate the amount of labour and material needed to provide even a temporary shelter for those unfortunates driven from their homes by the most horrible war the world has ever known.

Initiative, labour, and materials will be called for throughout the greater part of Europe, which will only add to the difficulties we shall have to face. Has any rebuilding been done in Belgium during the war? We know that whatever has been done is not worth considering. The Germans gave out that they had built up the ruins of Louvain; but in February last the same Germans announced that they do not intend, as was at one time reported, to undertake the rebuilding of Louvain.

Ā propos of this the *Echo Belge* remarked:—

"That it is bad enough that the Germans should have destroyed Louvain, but for them to rebuild it in the German style would be even worse."

On the same subject Mr. John Slater, F.R.I.B.A., presiding at the first Fothergill Lectures, in introducing the lecturer, said:—

"He hoped the Germans would not add to their crime of demolition any attempts to restore according to their own ideas what they had so ruthlessly destroyed."

Besides, it is expressly laid down in the new law, which we quoted in our article of January 7 last, that all building or rebuilding must have the sanction of the Belgian Government officials before being commenced.

However, the Belgians are better prepared than other nations for the raising up of their ruins, because, as the Rev. Herbert West said in a lecture on Belgian Architecture and History, "Belgium has been in the past the scene of constant battles. Only one other country had suffered in a similar way, viz., Palestine. For centuries Palestine battled with the savagery of the Assyrians, and later it was the scene of the contest between Christianity and its progress and the stationary militarism of Mohammedanism. Now on the soil of Belgium the old question of whether mankind should have free development or should be subject to military despotism was being fought again." And very slight knowledge of Belgian history will show that our country has always been the battlefield of Europe.

There, a hundred years ago, came Napoleon to have his power broken, and if on our soil German militarism is to be finally crushed we shall sorrow for our loved and glorious dead, but our sufferings will seem lighter to us because they will have served the cause of humanity. This introduction, though perhaps a little long, brings us to the point when we can consider it as certain that on the declaration of peace everything will require to be done, and we shall find ourselves face to face with one of the most tremendous tasks that any country has ever had to carry out.

Chas. Petein,
Architect.

THE LONDON MASTER BUILDERS' ASSOCIATION.

The Council met twice during March. In the same period important matters were dealt with by the various trade committees.

We take the following from the March Report:—

The Burden of the War.

Consultations with several of the trades in reference to the notices received in January for alteration of the existing Working Rule Agreements proceeded, and in each and every case the attitude was maintained by the employers in accordance with the resolution passed in February last and previously reported. Should no agreement be reached at the Local and Centre Boards the matter will be submitted to the National Board of Conciliation at its meeting which will be held about the middle of June next.

Restriction of Building Work.

Members will no doubt have noticed announcements in the daily Press by the Ministry of Munitions that, owing to the great shortage of certain types of building labour for the purposes of urgent Government work, no
building operations necessitating the e
ment of navvies, excavators, and b
labourers should be started without consu
with the Ministry of Munitions.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Avonmouth.—At a recent meeting of the Housing of the Working Classes Sub-Committee of the Health Committee it was stated that the Docks Committee desired to erect nineteen houses on vacant land under their management at King-street, Avonmouth, for the accommodation of men employed at the Docks.

Barrow.—The T.C. has passed plans for a new picture theatre to be built at Barrow by Mr. and Mrs. Routledge, Ltd.

Bassaleg (Mon.).—Commander Lord Tredegar has decided to erect a chapel at Bassaleg Parish Church, Monmouthshire, to the memory of his father, Colonel the Hon. Frederic C. Morgan, M.P., and his uncle, Viscount Tredegar.

Berkeley.—Mrs. T. P. Bailey has offered to put in the Parish Church a new heating apparatus, at a cost of £150.

Bridgwater.—At a recent meeting of Bridgwater R.D.C. a resolution was received, passed by the Thurloxton parish meeting, expressing the opinion that it was desirable an isolation hospital be provided for the district with as little delay as possible.

Broadstairs and St. Peter's.—The U.D.C. has approved the plan of a new dwelling-house, Lyndhurst-road, for Mr. G. H. Fuggle.

Chester.—In reference to the Buddicum Estate, the L.G.B. has suggested that the T.C. should proceed at once to obtain tenders for the erection of the proposed houses, and should submit a formal application for sanction to the loan required for that purpose, together with full particulars of the scheme.

Doncaster.—At the vestry meeting at Christ Church, Doncaster, recently the vicar called attention to the urgent necessity of repairs to the fabric. He suggested that the crypt might be converted into a vestry at a cost of £200, which would allow the baptistry to be used for its original purpose. Funds are being raised in aid of the new Wesleyan school building scheme. A site has been selected, and the total cost of the buildings is estimated at £5,000.

Dudley.—In reference to the Corporation scheme for the erection of 300 houses, the T.C. has accepted tenders by the following contractors:—Mr. William Roe (Wolverhampton), for the erection of thirty houses; Mr. Thomas Higgs (Wolverhampton), fifty-four houses; Messrs. Jenkinson & Davies (Rhondda), forty houses; Dudley Amalgamated Builders (Dudley), ninety houses; Messrs. Rogers & Sons (Cardiff), eighty-six houses; Messrs. Lewis & Taplin (Birmingham), for the construction of new roads and sewers on the Brewery Fields Estate (the site of the scheme), and for the widening of Bunns-lane and St. John's-road, and the construction of new sewers therein.

Dundee.—Plans and sections of proposed new buildings, etc., in Dundee have been submitted to the Works Committee of the T.C.:—Argyle-street, additions to villa, for Mr. James Smith; Bellfield-street, workshop and offices, for Messrs. Urquhart, Lindsay, & Co., Ltd.; Dundee-road, additions to cottage, for the trustees of the late Mr. John Sharp; Osborne-place, alterations on villa, for Sir James Urquhart; Strathmartine-road, alterations on and additions to office, for Messrs. Thomas Muir, Son, & Patton, Ltd.

Durham.—The R.D.C. has approved a plan submitted by the trustees for addition to Wesleyan Chapel.

Foleshill.—At a recent meeting of the Guardians and D.C. plans were approved for six bungalows at Bedlam-lane, Foleshill, for the British Bungalow Syndicate.

Glasgow.—We understand that a syndicate has secured a site at Eglinton Toll, Glasgow, for the erection of a new house of entertainment capable of seating 3,000 people.

Houghton Le Spring.—The Children's Homes Building Committee has agreed that an architect be engaged to draw up a specification of what is required to redecorate the homes, that tenders be obtained, and that the L.G.B. be informed of the steps the Guardians are taking.

Huddersfield.—Plans for extensive buildings for British Dyes, Ltd., have been approved by the B.C.

Hull.—The L.G.B. has sanctioned the borrowing of £20,230 by the Corporation to meet the expenses in respect of works and purchase of land in connection with the abolition of the Stoneferry-road level crossing.

India.—A proposal is before the Commissioners of the Station Municipality for an overhead reservoir and electric pumping plant to serve as

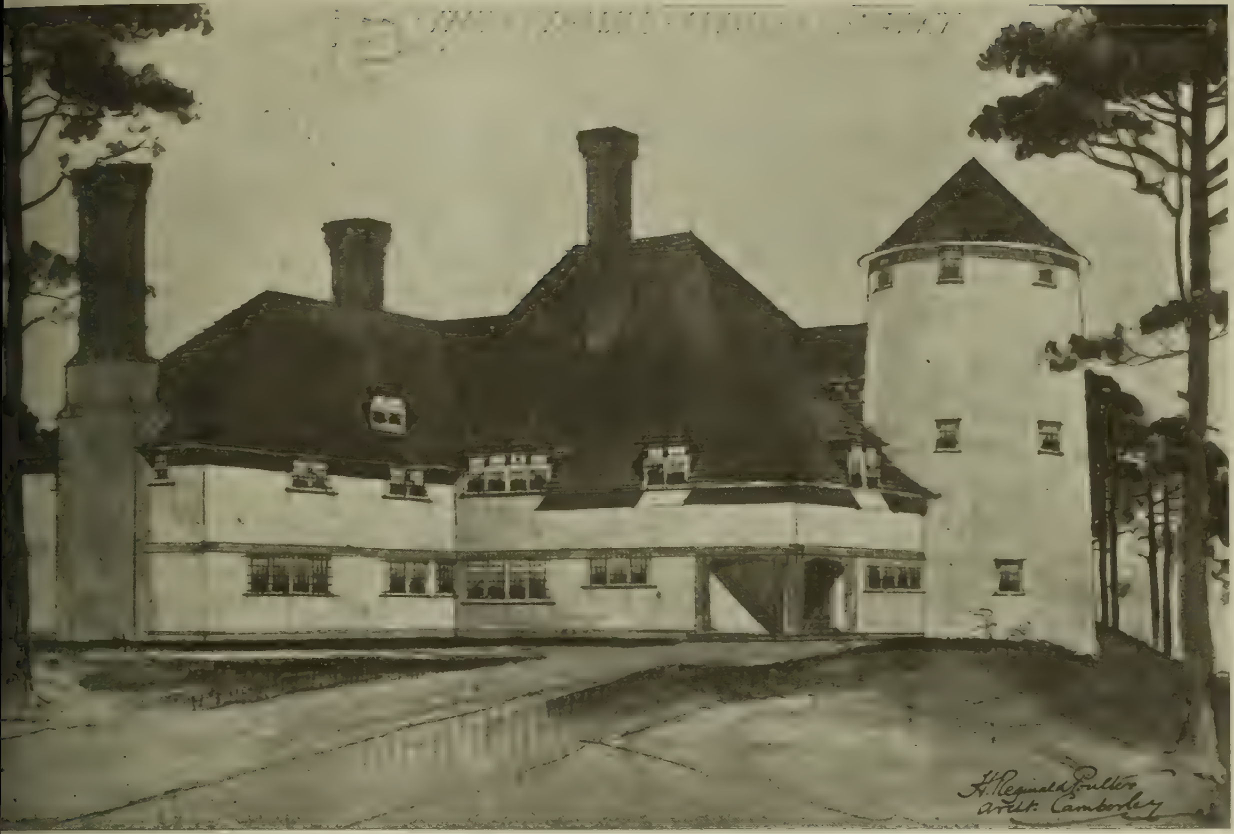
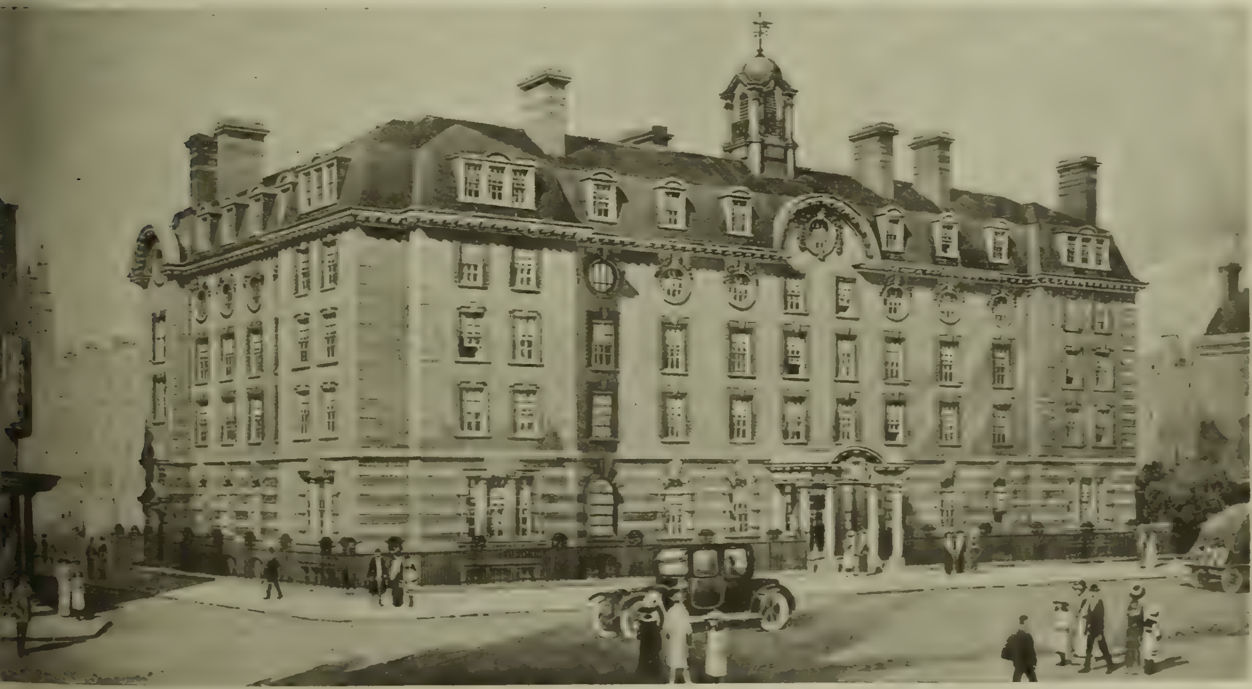
treated with Ironite, in addition to se
large reservoirs. Ironite flooring is also
used largely in munition factories.



The Old Mill, Frimley, Surrey. Mr. H. Reginald Poulter, Architect. (R.A. Exhibition, 1916.)

UTFORD HOUSE, W.

building, which is shown in this year's cademy, will shortly be opened as a al club for educated women workers. uated at the corner of Brown-street tford-place, W., and will give accom- n as follows :—In the basement, a large om and kitchen, scullery, and offices g. On this floor there is also the hall, laundry despatch-room, heating , coals, and cycle stores. A sewing- undry, and drying chamber for the use esidents have been arranged, together rge boxroom and lavatory accommoda- both residents and staff. There are service lifts from the servery and laundry despatch-room to the upper floors. On the ground floor, directly opposite the main entrance is the lounge, with windows overlooking and having an entrance into the garden. A library has been arranged to the right of the main entrance, and on the left there is a large social or drawing room, which will be used for dances, concerts, etc. A door from this room leads out to the garden. There has also been provided on this floor the office and the waiting-room, matron's sitting-room, and two private reception-rooms, also lavatories, cloak-room, and service-room. There are twenty-seven bedrooms on the first, second, and third floors and twenty-six on the fourth floor, giving a total accommodation for ninety-seven residents after deducting ten bedrooms for the staff, the servants' bedrooms having been arranged on the fourth floor. The building is heated by a low-pressure hot-water system, supplemented by fireplaces in the principal rooms and some of the bedrooms. Each bedroom has a small wall radiator. The artificial lighting of the building is by electric light, and the latest types of gas-cooking apparatus have been installed in the kitchen by the Gas Light and Coke Company. The building has been designed by Mr. V. Wilkins, architect, 12, York-buildings, Adelphi, W.C., and Messrs. Walter Lawrence & Son, of 19, Finsbury-square, E.C., are the contractors.



Nutford House, Brown-Street, W. Mr. Victor Wilkins, Architect. (R.A. Exhibition, 1916.)

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

L. CX.—No. 3823.

MAY 12, 1916.

THE ADAM MANNER.

MOVEMENTS in art produced by the work and influence of great personalities tend, after a period of progression, to expend themselves and to promote reaction, which for a time distracts attention from the ısic merit of the work produced by genius. It was in this that Wren lived to be treated with ingratitude, while the ler men who followed him considered that their work ıssed that of the great Renaissance architect whom erity acknowledges as one of the immortals of all time. doubtful whether the reaction which culminated in the ic Revival of the nineteenth century would not have ɔened at an earlier date had not the eighteenth century uced in the Brothers Adam architects whose work appealed only to architectural critics and learned patrons of art, to the world of fashion and the social instincts of the thier classes. The architecture of Vanbrugh and Gibb too monumental and alien to the lighter side of life to ıanently hold a place in the regard of the public; and the criticism may be made of a much greater man, Sir iam Chambers; but the work of the Brothers Adam appealed he desire of the world of fashion to have an appropriate ng for a life which was cultivated if artificial and elegant, sometimes wanting in sincerity and strength of purpose.

The Baroque never had a following in England, as its avagance and fancy were alien to the instincts of the people; though that extravagance was eliminated in the work of Louis-Seize period in France, the Brothers Adam worked in anner which was simpler and more in keeping with national iirements than the more elaborate contemporary work rance would have been. In including not only decoration the design of furniture and fittings in the sphere of their urs Robert and James Adam ensured its popularity as ogue—a popularity which has lasted to our day, and cates the wisdom of an architect who makes himself petent to give skilled advice on design as a whole rather on its more purely architectural aspects alone. The thers Adam were fortunate in their parentage, for their er, William Adam, was an architect of no little note, and a position in Scotland comparable with that of Carr at k and the Woods at Bath. They were fortunate also in use they made of foreign travel and the faculty they sessed of making use of their knowledge without becoming e copyists or imitators. The work they produced would n out of place in any other setting, only in a less degree n that of Wren or Inigo Jones, while it had the necessary eal to a generation which had learned to look abroad for sources of artistic inspiration. In the excellent book tten by Mr. John Swarbrick,* and produced by Messrs. sford in the admirable manner with which we associate ir name, we are given in a convenient form a concise and d account of the lives, works, and antecedents of the thers Adam, an account which is supplemented by over hundred fine illustrations. Adam work has been fully strated, for architects of the eighteenth century were not, their predecessors, indifferent to leaving evidence of the ent and character of their claims on the consideration of sterity; but the mere contemplation of work without some owledge of the actual conditions under which it was produced, d the place of those conditions in contemporary history, is t to lead architects astray. The repetition of forms which derived from classical architecture, without the environment of the sentiment and conditions which gave these reproductions a definite meaning and appeal, makes for lifeless architecture and mere antiquarianism. For the student the Adam style involves the study of the classical detail introduced into it—frequently replicas and representations of ornamental features derived from Roman or Pompeian sources which were proper and natural to the feeling of the eighteenth century; for the architect the essential things to be learned are the lessons of refinement, of proportion, and the use and effect of delicate lines of decoration and harmonious shades of colour, and the necessity of unity of type between decorative and architectural detail—in a word, those elements which do not depend on the reproduction of ornamental detail. Now and then it may be necessary to design for someone who is best pleased with a result which the Adams might have actually designed, but we shall serve architecture best if we show that we can assimilate without copying, and if we remember we are appealing to a people the educated classes of which are no longer dilettanti or antiquarians.

That Robert Adam worked in this spirit himself is evident when we reflect that he numbered among his intimate friends Clériseau and also Piranesi, and yet is known to posterity by work which has little correspondence to the contemporary work of France or of Italy; for it is in the minor details of decoration alone in which classical influences are apparent, and their introduction was a direct response to the spirit of the age. In the Preface to their works published in 1773 the brothers write:—"Our ambition is to share with others, not to appropriate to ourselves, the applause of the public, and, if we have had any claim to approbation, we found it on this alone: that we flatter ourselves we have been able to seize, with some degree of success, the beautiful spirit of antiquity and transfuse it with novelty and success through all our numerous works." They go on to explain how inappropriate the repetition of classical detail may be if applied without due discrimination as to its place and position. Such absurd compositions, they added, "took their rise in Italy under the first of their modern masters," who unintelligently used classical detail without considering its applicability. We can, in fact, learn from the Adams how we should in the present consider their own work, and a recognition of their point of view will show us that we should have greater regard for their memories than to consider their architecture a stereotyped example for present copying.

The great quality of Adam work is that, though its detail is always carefully considered, it is always subordinated to main architectural lines, and so is given its full effect. Though we may feel the results to be sometimes somewhat cold and formal, it possesses a quality of elegance in greater measure than the work of any other period. They showed how commercial building, which was in its inception, was compatible with architectural expression, and founded a manner which has given to many streets in the Metropolis an appearance of quiet and ordered dignity without the expenditure of great sums or any endeavour to create architectural *tours de force.* At the present time, when we are recognising the value of town planning and are learning to look on the street rather than the house as our unit of design, the proper understanding and knowledge of the work done by the Adams is more than ever necessary, for they solved, according to the needs of their generation, similar problems to those which confront us now, but on a smaller scale. Could they see the London of to-day it would be a matter for wonder to them that a people whose wealth surpassed by many times that of eighteenth-century England, and who had immeasurably greater access to the

---

"Robert Adam and His Brothers." By John Swarbrick, A.R.I.B.A. essrs. B. T. Batsford, Ltd., 94, High Holborn. £2 2s.)

knowledge of the past, could be so deficient in architectural sense as to tolerate the destruction of architectural amenity in our midst.

Messrs. Batsford have rendered a service to architects in bringing out this book now, for, however great and insistent the demand for economy may be after the present struggle, the work of the Brothers Adam is an example of the great truth that architectural excellence does not depend on cost but on refinement, thought, and a nice adjustment of means to end. That it has become a favourite field for the comme decorator should not blind architects to the fact that it af a medium for the expression of the requirements of the buil speculator as well as for the dainty and delicate desig boudoir and drawing-room. For Robert and James A recognised the truth that it is possible to replace the lands of nature with that of art, giving it its appropriate setting meaning. The day of uncontrolled expression of individu in architecture is past if we are to produce the best results

◆

NOTES.

Daylight Saving. We have never been able to understand the necessity for Mr. Willett's scheme as proposed, though all can appreciate the advantage of advancing hours of work during the summer. Noon has always approximately represented the time at which the sun is at the highest point above the horizon in the centre of each zone. It would seem to be a bungling manner of introducing a change to antedate the correspondence between noon and the same highest altitude by altering eleven o'clock to twelve o'clock. All the advantages claimed could be gained if the railway companies would alter the times of their trains by one hour, and if banks and business offices opened and closed one hour earlier. If people would not breakfast at seven o'clock unless it is called eight o'clock, we should be inclined to think human nature is even more erratic than we judge it to be; but the whole proposal as set out seems an odd way of trying to misguide people by offering them a counterfeit for a reality. It would take most of us longer to associate noonday heat in August with one o'clock than to take the plunge of breakfasting at seven o'clock and lunching at twelve o'clock instead of one. The point is to induce people to realise the advantages of change rather than persuading them they are making none.

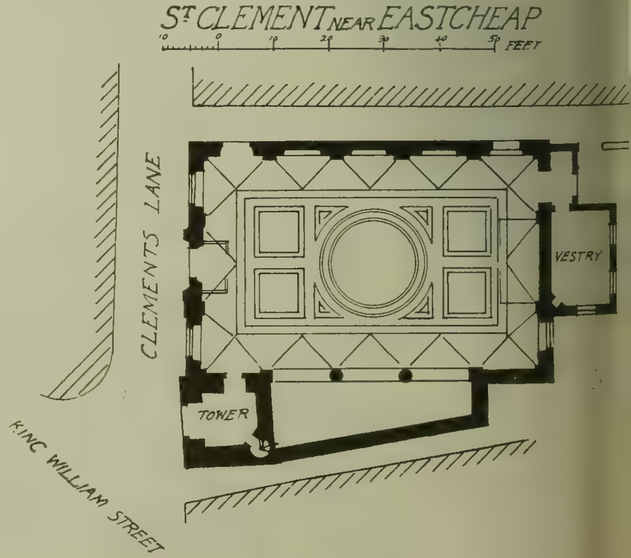
America and Quantities. We have a copy of a paper read before the seventh annual Convention of the Society of Constructors of Federal Buildings, at Washington, D.C., in which Mr. G. Alexander Wright advocates the advantages of having quantities. It seems a curious anomaly that in a country whose building materials are in many ways much better systematised than they are here, and whose building contracts as a general rule run to bigger figures, the custom of having quantities should not obtain. Most of the arguments used by Mr. Wright are too familiar to us to need repetition, as it is not necessary to preach to the converted. Builders have to take such enormous risks in estimating that it is a matter for wonder that they should ever be content to estimate for work, big or small, without full bills of quantities. There is ample justification for a demand for bills of quantities for a small house, and if they were forthcoming it is likely that contractors who do not care to tender for small work would frequently do so to the benefit of employer and architect alike. The builder who has many demands on his time is not likely to wish to give up three or four days to taking out quantities for a small house, but it is quite a different proposition to price a well-drawn-up set of bills for a small house.

Finance (New Duties) Bill. The Imperial Arts League have issued a strong protest against the inclusion of art exhibitions under the Amusements Tax, in which they urge that educational work should be excluded from the incidence of the tax, that the educational value of art has been recognised in every country, and that, as the usual price of admission is one shilling or less, the tax will often amount to over 33 per cent. It is further pointed out that such exhibitions are necessary to artists for the sale of their work, and that art exhibitions are already feeling the effect of the war very keenly. Thus the receipts at the Walker Art Gallery, which had averaged £3,000 a year for thirty-three years, fell in 1914 to £500, and the exhibition would have had to be given up had not private citizens agreed to defray the expense of holding it. The names of a large number of prominent artists and architects follow, including Sir Aston Webb, Mr. Ernest Newton, Sir Ernest George, Sir Thomas Brock, Messrs. Frank Brangwyn, Alfred Parsons, A. S. Cope, George Clausen, John Lavery, William Orpen, and many others, as well as Lords Plymouth and Redesdale. We are heartily in sympathy with the protest, as we feel that the tax will add little to revenue and tend to produce additional hardship among a class of men who are already suffering exceptionally from the trials incidental to the conditions of the time.

The Prevention of Bribery. A league has been formed under the title of the "Bribery and Secret Commissions League (Incorporated)," whose President is Sir Edward Fry, G.C.B., and the Vice-Presidents include the Marquis of Salisbury, Earl Fortescue, Lord Rotherham, and others. For the period of the war any who wish to join the League can do so as Associates on a payment of 5s. annually. The offices of the League are 9, Queen-street-place, E.C. Much as we sympathise with Sir Edward Fry's campaign against bribery and secret commiss and probable as it may be that in the near future, as is alleg the circular issued by the League, there may be much work fo League to do, we are doubtful whether legislation can do much than induce men who take or give indirect payment for ser rendered to adopt more subtle means of exchanging such siderations. We have penalised the man who makes the sma money payment at an election, but no penalty attaches to the who makes the greatest promises—promises which he knows never be performed, but which are often taken on their face v And whereas there is a limit to the amount of money which a ca date can use for purposes of direct bribery, there is no limit ex that of the credulity of the lowest class of the electorate to efficacy of promises made by an aspiring candidate appealing fo support of the voters.

Goods Handling and Distribution. Mr. Arthur E. Collins, the City Enginee Norwich, writes a strong and interesting l advocating that the Board of Trade should investi the proposals made by Mr. Gattie for establishi Railway Clearing House for goods, the advant of which are not limited to the public but extend to the railw whose earning capacity would be increased. Mr. Gattie's suggest have been endorsed by high authorities such as Mr. James Swinb and Dr. Hele Shaw, but so far the railway companies have thr cold water on them. Mr. Collins points out that, though the effici of the locomotive is a hundred times as great as that of a motor l the latter successfully competes with the locomotive owing to heavy terminal inefficiency which exists, and such competitio possible at the expense of the upkeep of our roads. More than though the country is advantageously situated for dealing industrial transport, our inland freights are the highest in world, and railway inefficiency congests our docks, causing u detention of shipping and consequent shortage. We believe t charges to rest on a substantial foundation.

A "Peace Room," Chelsea. Mr. Kemp Prosser has made a fresh colour sch for his "Peace Room" at No. 11, Manor H Studios, Flood-street, Chelsea. The violet signifies the love for truth, spiritual perceptio denoted by a canopy of sapphire, love for light space is expressed in the lemon-yellow hue of the walls, and and perception in the green and mauve of the curtains. The w rose of silence and power flanks the cross, shapened as a key of which surmounts the dove upon an embroidered cloth and fo a draped background for the grand piano coloured in gold. understand that the room will be opened to wounded soldiers refreshment and repose, with recitations and performance of m at stated times until the end of the current month.



Wren's Churches. (*See page* 347.)

E LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

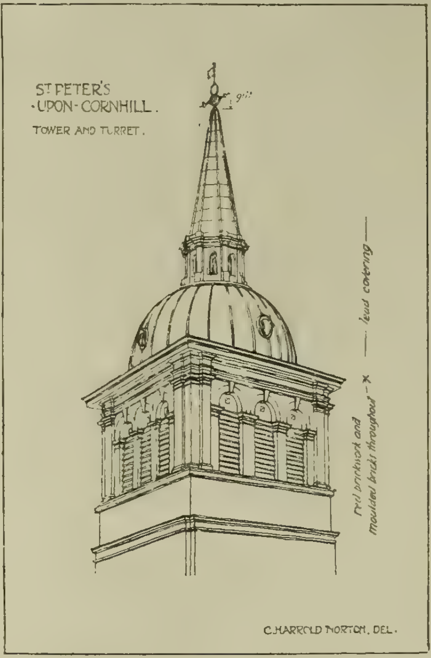
No. XXXII.—St. Peter, Cornhill.

BRASS tablet which was preserved from Great Fire and is now fixed in the vestry t. Peter, Cornhill, states that King Lucius, first Christian King of Britain, built hurch on the site A.D. 179, and this ch was constituted a cathedral till the of Augustine 400 years later, when the bishop's see was removed to Canterbury. hout giving too much credence to this ition, it may be assumed that a church ed on the site in very early times.

he advowson belonged in the fourteenth ury, together with that of St. Margaret ens, to the Nevills, but was finally con- d in 1411 to the Mayor and Commonalty London, in whose gift it has since ined. The first church was rebuilt in reign of Edward IV., with the exception of steeple, and extensively repaired in 1632. n's church was built in 1680-81 at a cost of 47. The east elevation is a pleasing feature racechurch-street; the main entrance is ugh a porch from Cornhill, flanked with s on either side. The structure is neither beautiful nor interesting, but the woodwork fittings, especially the door-cases at the end, the chancel screen, pulpit, and the r, are exceedingly good; and the font, the r of which belonged to the previous church, excellent example of design. The appear- of the interior is spoilt by the very high s on which the nave pilasters rest and somewhat unpleasant form of the elliptical ng. The tower, which is rather picturesque beautiful, can best be seen from the church- l immediately to the south of the church.

No. XXXIII.—St. Clement, near Eastcheap.

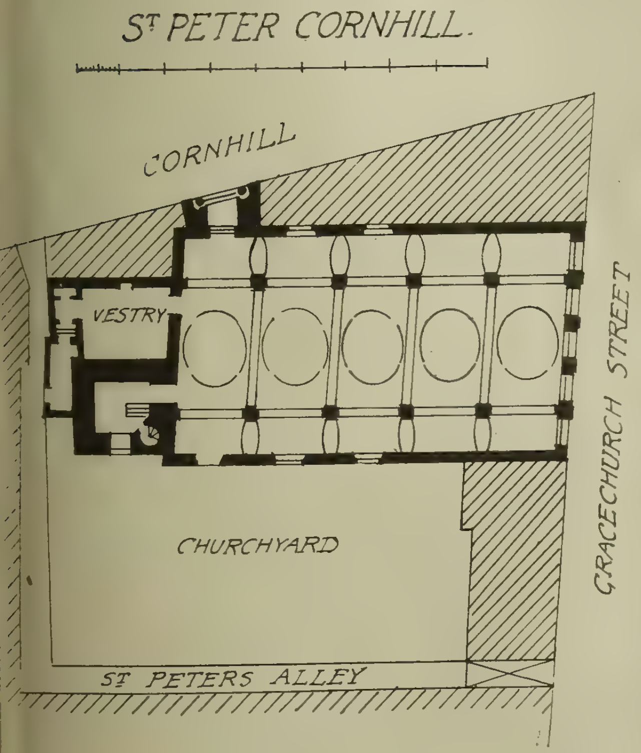
The church of St. Clement is situated in Clement's-lane, near its southern end in King William-street. It replaces a former church of the same dedication, and one which was not rebuilt after the Great Fire, named St. Martin Orgar, which was situated in Martin's-lane, Cannon-street. Though this church was not rebuilt, it was repaired and served as a meeting-place for French Protestants, being demolished early in the nineteenth century. The advowson of St. Clement belongs to the see of London, and the church was built by Wren in 1686 at a cost of £4,365, but it was unfortunately modernised and decorated under the direction of William Butterfield in 1872, and robbed in the process of much of its interest. It is a rectangular building with a flat ceiling, having a deep cove round, into which the clerestory windows cut, and has a single aisle separated by columns from the nave. There is little work of interest in it besides two good door-cases and a fine pulpit. The external treatment is wanting in architectural quality, though it is recorded that the parishioners were so pleased with the tower that they presented Wren with one-third of a hogshead of wine in recognition of their satisfaction with his services.



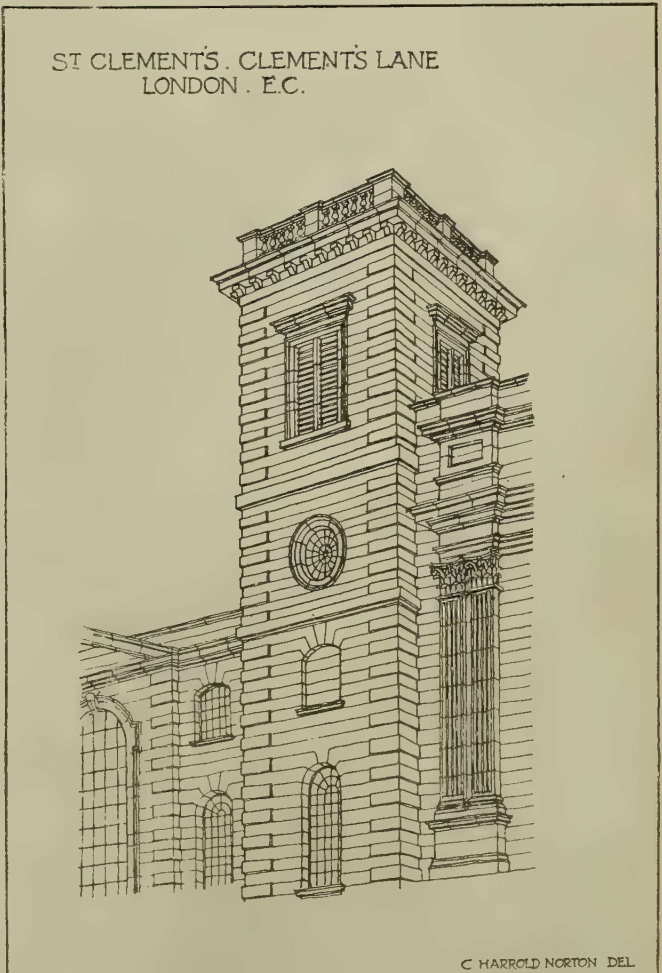
◆

A TOWN-PLANNING OPPORTUNITY.

In rebuilding those parts of Dublin which have been broken in the recent fighting an opportunity should be given to some architect to produce a large scheme. Sackville-street, though it boasts of being the widest thoroughfare in the kingdom—a claim that portions of the Whitechapel-road might dispute—was certainly motley in its architecture and contained much that lacked any dignity of appearance. Its front had that broken aspect which comes when new buildings are allowed to shoot up above the old and when there is no unity of thought among the different architects employed. Behind it and to either side along the quays is much property that will be none the worse for being cleared away. There are worse things than a big fire for a capital city which is emerging into prosperity after a long decay of the grandeur which marked it in the past.—*Westminster Gazette.*



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)



We take the following from the Report of the Council of the R.I.B.A. for the official year 1915–16:—

"In addition to the normal losses the Council have to record the death of twelve Associates, seven Licentiates, and twelve students, who have laid down their lives in the service of their country. There are now 1,919 Licentiates on the roll. Since the publication of the last annual Report twelve Licentiates have passed the examination qualifying for election to the Fellowship, and seven of these have been duly elected as Fellows.

The Progressive Examinations were held in June and November-December, 1915. The Preliminary was held in London, Bristol, and Manchester. The Intermediate was held in London, Bristol, and Manchester. The Final and Special Examinations were held in London. The results are shown in the following table:—

	Admitted.	Exempted.	Examined.	Passed.	Relegated.
Preliminary Examination ...	110	53	57	38	19
Intermediate Examination..	95	60	35	16	19
Final and Special Examination ...	81	—	81	37	44

The Statutory Examination qualifying for candidature as District Surveyor in London, and for candidature as Building Surveyor under local authorities, was held in London in October, 1915. There were eight candidates, of whom five passed.

The Council desire to thank the Hon. Examiners for the continuance of their invaluable services. Since the issue of the last annual Report the Council have appointed the following gentlemen to serve as representatives of the Royal Institute:—Messrs. Max Clarke and F. M. Elgood (County Councils Association Road Congress and Exhibition, June, 1915); Messrs. Paul Waterhouse and W. R. Davidge (Institution of Municipal and County Engineers' Road Conference, June, 1915); Mr. Reginald Blomfield, R.A. (the London Society); the President and Sir Aston Webb, C.B., R.A. (National Congress on Home Problems after the War); Messrs. H. V. Lanchester and John Slater (University of London Architectural Education Committee); Mr. J. Alfred Gotch (University of Sheffield); Sir John Burnet and Mr. Guy Dawber (Central Organisation of Trade Interests); the President and Messrs. Paul Waterhouse and H. D. Searles-Wood (Committee on Organised Science).

During the course of the year the President has appointed the following architects to act as arbitrators in connection with building disputes:—Messrs. Max Clarke, W. E. Vernon Crompton, Mowbray A. Green, Edwin T. Hall, Henry T. Hare, Alan E. Munby, John W. Simpson, W. Gillbee Scott, John Slater, Sydney J. Tatchell, Adam F. Watson, Percy S. Worthington.

Since the issue of the last annual Report the Council have made the following grants:—Architectural Association, £500; Architects' Benevolent Society, £100; Architects' Volunteer Training Corps, £50; Artists' War Relief Exhibition, £10; Society of Dilettanti, £50; British School at Rome, £50.

In addition to the special grants to the Architectural Association which were mentioned in the last annual Report, the Council have been enabled to present to that body a further sum of £400. Of this amount £200 was paid in respect of the financial year ending December 31, 1915, and £200 in respect of the current year.

The grant of £50 to the Society of Dilettanti was the result of an undertaking entered into before the war to enable the Society to publish their new volume of "Antiquities of Ionia."

The work of the Royal Institute has, of necessity, been seriously affected by the war. The programme of sessional papers has been suspended and only business of a routine and uncontroversial nature has been transacted at the general meetings. The prize competitions for the year have again been postponed, and the examinations which in the ordinary course would have been held in November, 1916, have been cancelled.

The Record of Honour which has been compiled by the Royal Institute now contains the names of some 2,250 architects who are serving in the Forces. Included in this number are fifty-seven Fellows, 426 Associates, 228 Licentiates, and 272 students of the Royal Institute. The following is a list of those of our members who have lost their lives in the war:—

Associates.

Laurence Kingston Adams, Lieutenant, 7th King's Liverpool Regiment—Killed in action.

Spencer Ellwood Barrow, Lieutenant, 5th Battalion King's Own Royal Lancaster Regiment—Died of wounds.

James Everitt Bownass, Princess Patricia's Canadian Light Infantry—Killed in action.

Wren's Churches: Font, St. Peter, Cornhill.
(*See page* 347.)

Leonard John Finning, Sergeant, 24th Battalion 6th Australian Infantry Brigade—Killed in action.

Edmund Herbert Gibson, Lieutenant, Royal Naval Volunteer Reserve—Died of wounds.

John Nixon Horsfield, Lieutenant, Royal Naval Volunteer Reserve—Died of wounds.

Wilfred Hoyle, Royal Fusiliers—Died service.

George Edward Hunter, Captain, Northumberland Fusiliers—Killed in actio

George Alexander Kay, Second Lieute 2nd Notts and Derby Regiment—Kille action.

William Leonard Boghurst Leech, Rifle 9th County of London Regiment—Die wounds.

Albert Edward Lowes, A.S.C., 6th North berland Fusiliers—Killed in action.

Louis Augustus Phillips, Sergeant. P Schools Battalion, Royal Fusiliers—Kille action.

Licentiates.

George Pigrum Bowie, Captain. Battalion 1st Canadian Contingent—Kille action.

Aldersey Dicken, Sub-Lieutenant. R Naval Volunteer Reserve—Died on servi

Christopher René Harrison, Lieutenant, Leicester Regiment—Died of wounds.

Charles Henry Rowed Henman, Qua master-Sergeant, 1st Field Company, Divis Engineers, R.N.D.—Killed in action.

Arthur Maxwell Phillips, Captain, 11th K Own Yorkshire Light Infantry—Killed in ac

Henry Charles Pullin, Rifle Brigade—K in action.

Alexander Wingate, Second Lieutenant, Highland Light Infantry—Killed in acti

Students.

Thomas William Dowsett, Sergeant, Artillery Company—Killed in action.

Edward George Dawson Fromant, La Corporal, 1st City of London Sanitary Comp R.A.M.C.—Died of wounds.

Adrian T. Hardman, Lieutenant, F Fusiliers—Died of wounds.

Topham Becher Dabridgecourt Hough, Se Lieutenant, 8th East Yorkshire Regim Killed in action.

John Hawksmore Irvin, 4th Battalion forth Highlanders—Killed in action.

F. H. Lawson, Captain, 5th Batt Northumberland Fusiliers—Killed in actio

Charles Joseph Newbery, Private, 3rd F Fusiliers—Died of wounds.

Thomas Edwin Turner, Lieutenant, County of London Regiment—Killed in ac

James Bernard Millard Walch, Se Lieutenant, 2nd Royal West Surrey Regi —Killed in action.

Denis H. Walker, Captain 5th P. Yorkshire Regiment—Died of wounds.

Leslie George Whitbread, Private, Battalion Manchester Regiment—Died service.

Henry Montagu Whitehead, Se Lieutenant, 4th East Surrey Regim Killed in action.

The most important work of the year been that done by the Architects' Committee and its two subsidiary Commit The Architects' Benevolent Society has rend the most valuable assistance in the admini tion of the funds subscribed for the reli architects, and the Civic Surveys which been set on foot with the assistance of Royal Institute have provided paid employ for a number of members of the profe whose practices have been stopped by the The most important of these surveys—th Greater London—is housed in the R.I. Galleries, and the expenses of all the sur are paid by the R.I.B.A., while the sal of the workers are paid by grants from National Relief Fund.

The consideration of the Report of Official Architecture Committee, referred t the last annual Report, has been again def for twelve months.

The usual statement appended to this Re shows that the finances of the Royal Insti have met the strain of war conditions with g success.

Most of the architectural students are ser in the Forces, and there is consequently a he fall in the receipts from examination The subscriptions of all members and Licenti serving with the Forces are also remitted. 1915 this measure cost the Institute s £700, and in 1916 it will probably cost over £900.

spite of these and other losses there was ·lised surplus of £719, in place of an ·ipated deficit of £260, in the financial ending on December 31, 1915, and a ·erate surplus is also anticipated in the ·ent year. It will be observed that a sum :290 was received from the Henry Jarvis ·t in aid of the educational work of the ·al Institute. The warmest thanks of the ·ncil are due to the Finance and House ·mittee, whose careful management has been ·onsible for such satisfactory results."

◆

CIVIC CENTRE, SEATTLE.

HE city of Seattle occupies a position of ·ual natural beauty and diversity at the l of Puget Sound and Lake Washington, is one of the American cities which has ·eloped most rapidly within the last thirty ·rs. Its development has been in good ·ds, and large views of its future needs ·e guided its builders. In 1909 it was decided a city plan should be prepared at a cost of .000, a measure which was passed by the ·est popular vote ever recorded in the annals the city. The Commission numbered ·nty-one, and were chosen from the Board Education, the Park Commission, Board of ·lic Works, City Council, County Com- sioners, the Washington State Chapter of American Institute of Architects, Engineers' ·iety, Commercial Club, Central Labour ·ncil, Carpenters' Union, water front owners, ·et railway, steam and marine transportation ·panies, the Clearing House, manufacturers, l estate and bar associations. It met every weeks from June, 1910, to September, .1, when it presented its final Report to the ·y Council.

Seattle: View of Civic Centre from Olympia Mall.
(From the *Journal* of the American Institute of Architects.)

·he Report dealt with arterial highways, ·id transit, municipal decorations, harbour ·provements, rail transportation, the civic ·tre, and contained general and detail maps ·h appendices giving engineering data for the ·struction of the various projects mentioned. ·e plan was developed inward from its ·iphery, co-ordinating the highway, rapid ·nsit, railway and water services. The Civic ·ntre, which we illustrate, was the outcome the solution of these practical problems l not the point of departure. Though the ·izens of Seattle had approved of the making the plan, they rejected a proposal to carry out in a concrete form from the fear that ·lividual property interests might be dis- ·rbed; but, though it was rejected in its ·tirety, the portion of the plan which repre- ·ted a comprehensive plan of port develop- ·ent was adopted as a definite scheme, and .200,000 has already been expended upon it. ·e scheme for a Civic Centre is not likely to be ·opted in the near future, but Seattle must the gainer by having before it a systematic d well-thought-out plan embracing the ·y's needs as a whole.

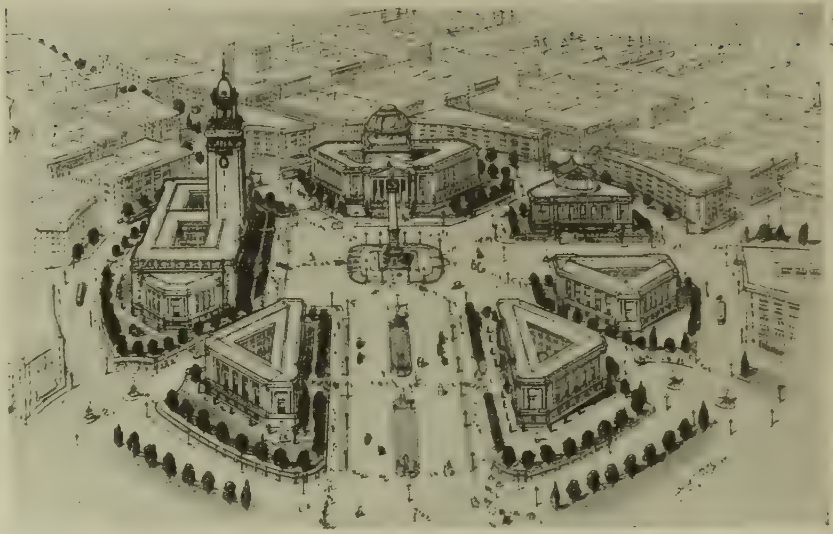
NEW LECTERN, SEAFORD CHURCH.

A carved lectern has recently been placed in ·aford Church. It is composed entirely of ·k, and is 6 ft. in height. The work was ·rried out by Messrs. Harry Hems & Sons, ·ulptors, Exeter.



Seattle: Civic Centre and Diagonal Approach to present Business District.
(From the *Journal* of the American Institute of Architects.)

CORRESPONDENCE.

National Housing and Town Planning Congress.

SIR,—Mr. Norman McKellen in his letter on this Congress asks to draw attention to "an important phase of the proceedings which does not appear in your admirable report." May I point out that the matter he refers to was dealt with in the first portion of the report, which appeared in the *Builder* of April 21?

THE WRITER OF THE REPORT.

The Wonder of Work.

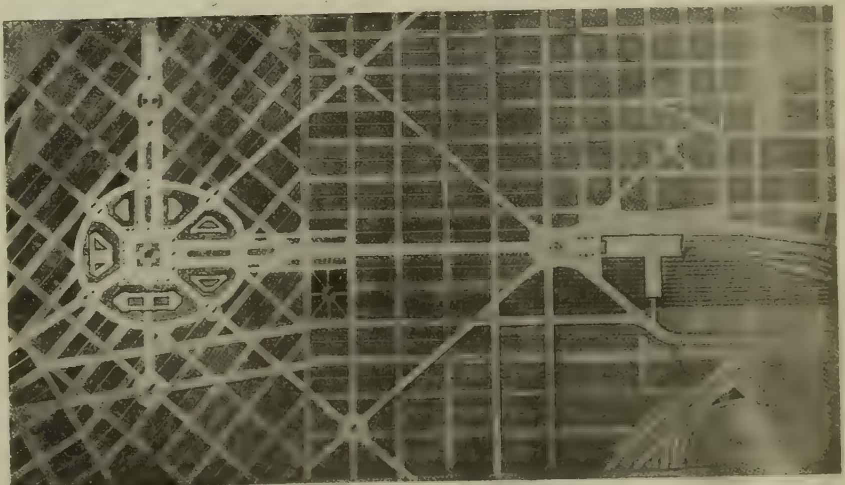
SIR,—I did suggest an article on the "Wonder of Work" to the Editor of the *Studio*, and he accepted it—accepted the illustrations; but before I could get the "statement" finished he returned them. He rejected the illustrations, because (letter dated March 27) "as to the Port of Genoa, which you say ought to come well in reproduction, I have sufficient experience of half-tone reproduction to know it will not." The very remarkable reproduction you printed answers that; while, if any further answer is required, this very print was selected to illustrate the British official catalogue of the Leipzig Exhibition of Graphic Art in 1914, and was there reproduced in half-tone, as, I believe, an example of what could be done by that process in England!

The Editor then continues:—"To speak quite frankly, I do not think the collection (of prints) you sent me contains your best work, and I should prefer to wait till you have something better to offer. I return the prints herewith," and his letter speaks for itself. But amongst the prints not worthy of a place in the pages of the *Studio* were the three others you published—one, the Woolworth Building, had already appeared in the *Studio*, is owned—the stone—by H.M. Government, and has been on exhibition for some years at the Victoria and Albert Museum as an example of modern lithography.

The other, the Campanile, is owned by the Municipality of Venice, and was selected by them for publication on the completion of the building.

The Shipbuilding Yard has only just been published. Of course, the Editor of the *Studio* may be right and all the authorities, owners, and collectors wrong.

JOSEPH PENNELL.



Seattle: Plan of Civic Centre, Central Avenue and Railroad Project.
(From the *Journal* of the American Institute of Architects.)

GENERAL NEWS.

Professional Announcement.

Mr. C. M. Hadfield, F.R.I.B.A., of Cairns Chambers, 19, St. James-street, Sheffield, will continue the practice of an architect and surveyor, hitherto carried on in partnership with his late father, with whom, during more than thirty years, he worked in close association as pupil, assistant, and since 1897 as partner.

The British Firing Line.

Quartermaster - Sergeant - Instructor E. Handley-Read, of the Machine Gun Corps (and late of the Artists' Rifles), has just completed a large series of water-colour drawings depicting the trenches and scenes familiar to our men in the British firing-line. An exhibition of these pictures is to be opened on May 12 at the Leicester Galleries, Leicester-square.

The Royal Sanitary Institute.

At an examination in Sanitary Science as applied to Buildings and Public Works, held in London recently, Mr. H. A. Watkins, Richmond, was granted a certificate. Three candidates at an examination in School Hygiene were granted certificates, and at an examination for Inspectors of Nuisances ten candidates were certified, as regards their sanitary knowledge, competent to discharge the duties of Inspectors of Nuisances.

Estate for the City of Birmingham.

Mr. Barrow Cadbury has offered to the City of Birmingham as a gift from himself and his wife the property known as the "Uffculme Estate." Uffculme is in Queensbridge-road, near King's Heath Station, and comprises 36 acres of land partly occupied by the Open-Air School, a large field on the opposite side of the road, and about 3 acres of allotment land. Mr. and Mrs. Cadbury have stipulated that if houses are built upon it there shall not be more than ten to the acre, and all shall be erected and the grounds laid out on Bournville Village lines. The site has a southern aspect, is close to the tramway running from the city to King's Heath, and is also near to King's Heath railway-station.

Whiteley Homes.

These Homes, some of the designs for which we illustrated in our last issue, are being built on a beautifully wooded site called Barhill Park, near Walton-on-Thames, from the designs of seven different architects, for the Trustees of the Whiteley Homes, the general lay-out being from a design by Mr. R. Atkinson, selected in limited competition, and the general building scheme by Mr. Walter Cave, each of whom is also architect for a section of the Homes; each architect had discretion as to the placing of his individual buildings in his particular section. Each inmate will have a living-room and small kitchen. The houses by Sir Aston Webb, R.A., & Sons, provide accommodation for thirty inmates, together with a nurses' home and a recreation hall accommodating some 500 people. The contractors for the whole buildings are Messrs. Henry Martin, Ltd., of Northampton, and the clerk of works is Mr. F. Comport.

Effect of the War on Art.

Lord Redesdale took the chair at the annual dinner of the Artists' General Benevolent Institution at the Hotel Cecil. Proposing the toast, "Prosperity to the Artists' General Benevolent Institution," the Chairman said that at the present time, when taxation was straining the power of the rich man almost to breaking-point, works of art were among the first luxuries with which men were compelled to dispense. Vast sums were given now and again for masterpieces of Rembrandt, Titian, Velazquez, Reynolds, and Gainsborough, but these prices were paid by millionaires, who for the most part were men who did little or nothing to encourage modern art. Even for the most successful artists it must be a difficult matter to realise anything approaching their normal income. Of all professional men, none had offered themselves so ungrudgingly as a sacrifice in this war as the artists.—Sir Aston Webb announced that the list of collections and donations had reached a total of £3,124.

A Sargent Exhibition.

An exhibition is being arranged by Miss Elizabeth Asquith at the Grafton Galleries in June, at which many of Sargent's portraits will be shown. The funds realised from the exhibition will be given to the Arts Fund, of which Miss Asquith is Chairman.

Bust of Cardinal Newman.

A bust in bronze of Cardinal Newman has been set up in the gardens of Trinity College, Oxford. It is placed under the rooms occupied by his tutor, and looks towards Wadham College. On one side of the bust there is the note, "A. Broadbent, sculptor, 1915," and on the other, "Presented by D. La Motte, Esq., M.A." The pedestal, which is of stone, bears the inscription, "John Henry, Cardinal Newman, 1801–1890."

The Surveyors' Institution.

Mr. F. Noel Keen, of the Parliamentary Bar, lecturing at the Surveyors' Institution on Monday, submitted a comprehensive scheme for the development of agricultural land. He suggested that within a radius of 10 miles from the centre of a town 10,000 or 15,000 acres might be acquired first and the enterprise managed by a Parliamentary company as one co-operative concern. The company, which would be under Parliamentary control, should not be run in the interests of outside capitalists, but a large financial interest, and if possible the predominant interest, should be vested in those engaged in active employment under the company.

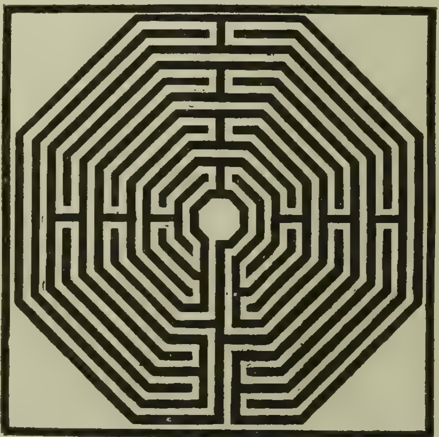
Project to Dry the Zuyder Zee.

The problem of removing the water from the flooded district of North Holland has not yet been solved. About 40,000 acres, it is stated, are now inundated in that province. The average height to which the water must be lifted is only 3 ft. to 4 ft., but the total amount to be pumped approaches 7,000,000,000 cub. ft. This flood has revived the project of drying the Zuyder Zee, and a Bill is now before the Netherlands Parliament for appropriating money for this work. The expense is estimated at £18,000,000, part of which is to cover indemnities to fishermen and for similar purposes. The cost of the dams will probably be under £10,000,000. The principal dam would be about fifteen miles long and average 20 ft. in height.

Arras Cathedral.

We have received from Messrs. Gay & Hancock, Ltd., publishers, 12 and 13, Henrietta-street, Covent-garden, W.C., the following letter, together with a print, a reproduction of which we give herewith :—

"SIR,—We are enclosing herewith a print of the 'labyrinth of the Arras Cathedral.' It has been sent to us by one of our travellers, who is at the front, W. H. Anderson, of the Royal Scots. He informs us that it is not a 'puzzle,' but a plan of the labyrinth under the Cathedral. He found the prints in a ruin in the vicinity, a house which appears to have been occupied by a librarian from what he saw among the *débris*."



"Labyrinth," Arras Cathedral.

Park as War Memorial.

Mr. A. V. Paton has presented to the Natio Trust, as a memorial of his brother, Capt M. B. Paton, South Lancashire Regiment, w lost his life in Gallipoli, and of other Wir men killed, an open space of about 18 acres moorland adjoining Thurstaston Comm Cheshire. By arrangement with the Natio Trust the Birkenhead Corporation will take ov the management.

Art Treasures Destroyed.

It is stated that all the contents of the Roy Hibernian Academy, in Lower Abbey-stre Dublin, were completely destroyed during t recent outbreak in Ireland. They includ many valuable works of art, for at the ti of the rising an exhibition of pictures a sculptures was being held, while in the gall there were portraits of a long line of preside extending back over a century.

Captain Scott Memorial.

In St. Paul's Cathedral a few days ago t Prime Minister unveiled a bronze memor tablet to the memory of Captain Scott and l gallant companions. The memorial, the wo of Mr. S. Nicholson Babb, contains a medalli portrait of Captain Scott and a panel in rel representing the Polar party on the marc These are within an architectural framin surmounted by three allegorical figures— the right, "Discipline"; on the le "Courage"; and in the centre, "Glory."

University of London, King's College.

The training classes for munition work which were established at King's Colle Strand, W.C., last July, with the approval the Ministry of Munitions, are now advertis for applicants. Some 300 students ha already qualified, and of these at least 85 cent. are known to have found employme Students with any mechanical ability, willi to go where required, are now in great dema for skilled work at good wages, and can th render most useful national service if ineligi for military service. The opening up of t new national factories with enormous numb of automatic machines requires the ra training of large numbers of tool-sette King's College has already supplied a la number of such men to various firms, and n machinery has been installed for furtl expansion in this direction.

The Ruins of Arras.

From the British Headquarters in France t special correspondent of the *Times* sends t following notes of a visit to Arras :—"There a some who say that Arras is even more impr sive than Ypres. Perhaps it is. It is certai impressive and terrible enough. It is not great a ruin as Ypres. While it is not easy find a house which still has glass in all windows, or the front of which is not m or less pitted with the marks of rifle a shrapnel bullets, there are whole streets wh are structurally intact. The worst of t ruin here is concentrated in three or fo chief points, the most notable of which are t Place de la Gare, opposite the railway-statio the Petite Place, with the ruins of the beauti Hôtel de Ville, and the neighbourhood of t Cathedral. Each of these points has serv as a constant mark for the German gunn and still so serves to-day. Inside the stati building is a forbidding scene. Though t building is a skeleton of twisted iron and sto with shell-holes among the metals and heap rubbish blocking up the platforms, the inter is perhaps less depressing than the Pla outside. Here is desolation itself, hardly building having anything approaching to intact front. The Petite Place is simp heartbreaking, with the ruins of the beauti sixteenth-century Hôtel de Ville, one of t finest in France. Three only of the sev famous Gothic arches now stand, and ev those are chipped and battered, and likely be more chipped and battered as the days by, for the Germans still persistently torture t beautiful ruin almost every day. More terri even perhaps than the Hôtel de Ville is wh is left of the fine Cathedral of St. Vaa Hardly in Rome itself can you see ruin on more colossal scale."

COMPETITION NEWS.

ist be understood that the following information is as news, and not as an advertisement; and that, ery endeavour is made to ensure accuracy, we cannot nsible for errors that may occur.

The Civic Arts Association:
etition for Memorial Designs—General Conditions.

competition is divided into eight classes, mpetitors may enter for as many classes y please. Each class will be judged by of not less than three chosen by the tive Committee from amongst the ng names:—Messrs. Charles Aitken, ning-Bell, A.R.A., George Clausen, R.A., rl Ferrers, Mr. Graily Hewitt, Professor Image, Mr. T. Stirling Lee, Professor Lethaby, Sir Robert Lorimer, Messrs. Iaclagan, Thomas Okey, H. R. Hope-, Professor A. B. Pite, Mr. F. W. Pomeroy, ., Professor E. S. Prior, A.R.A., Messrs. d Rackham, A. E. Richardson, W. nstein, Charles Shannon, A.R.A., Charles A.R.A., E. Catterson Smith, F. W. Troup, nce Turner, Allan Vigers, Emery Walker, d Warren, W. W. Watts, Lawrence r, Henry Wilson.

awards of the juries will be given to the lesigns. The awards will be final and g, and will not be subject to any appeal. event of all the designs submitted in ass being regarded by the jury as unsatis- solutions of the artistic problem set ht is reserved to withhold the awards.

gns, etc., are to be clearly marked with mber of the class only. No device or re to be used. Accompanying each and attached to it, must be an envelope, with a blank seal, containing name and s of the author, to be opened after the

petitors submitting more than one design end a separate envelope with each.

designs submitted must be entered in me or names of the actual designer or rs. The name of a firm may be appended substituted for the name of the designer.

drawings and models must be delivered e paid at 23A, Maddox-street, on Monday,), between nine and four. The Civic Arts ation will take all reasonable care of the gs and models submitted, but cannot ponsible for loss or damage howsoever

prize designs and such others as may be for the purpose will be exhibited by vic Arts Association at the Galleries of yal Institute of British Architects during ext. The Civic Arts Association reserves ght to exhibit selected designs in the ces after the London Exhibition.

designs to be called for by competitors notified.

ights are reserved to the authors except einafter provided in Classes II. to V.

prizes are independent of any commission e for the use of the design after execution.

Civic Arts Association reserves the right w the publication, within twelve months, design, etc., submitted, and in such the author's name will be given.

gns shall be drawn on stout paper, and not be mounted on card or stretchers, ned or glazed.

lass VI., however, canvas and mounting owed (see detailed conditions).

Detailed Conditions.

Class I.

gn for a monument suitable for erection centre of the members' courtyard at the 'ounty Hall, London [this courtyard is ched from the entrance to the buildings Westminster Bridge-road] in commemor- of those of the London County Council ho sacrifice their lives in the war. The of the prize desires that a cross shall form of the design, and that the symbolism be religious. The general character of nonument should be sculptural rather rchitectural, but with due regard to the of its setting.

vision is to be made for a brief inscription, ot for lists of names. No design will be ered that obstructs too much the view entrance doors from the Westminster e-road.

The London County Council is in no way committed either to the memorial or to the designs which may win the prize, but the Civic Arts Association will submit the prize designs to the London County Council for its consideration.

Competitors are permitted to visit the site in order to study the character of the surrounding buildings; and if further information is required as to the portions of the building not yet completed it may be obtained of the architect, Mr. Ralph Knott, Adelphi-terrace House, Adelphi, W.C. The sketch plan (see p. 352) shows the limit of the size for the base of the monument, viz., 20 ft. in diameter, and it should not exceed 32 ft. in height. The materials should be Portland or Purbeck stone, or stone and bronze, not marble.

The drawings are to include plan and one or more elevations to a scale of ½ in. to the foot, and such other details to a larger scale as the competitors may desire, but not more than two imperial (30 in. by 22 in.) sheets may be sent in. In addition to the scale drawings, competitors may submit a perspective on a sheet not exceeding 15 in. by 22 in., or a model to a scale not exceeding ½ in. to a foot, or both perspective and model.

The following prizes will be given to the best designs:—First prize, £50; second prize, £15.

*Class II.**

Design for a wall tablet in cast bronze, the area not to exceed 4 super. ft. The inscription is not to exceed forty words, and its composition is left to the discretion of competitors, subject to its being in memory of an individual soldier who has fallen in the war. The design may include figures, a coat of arms, or a regimental badge. It must be such that it could be executed for £50, and must be shown by a half-full size plan and elevation, and such full-size details of moulding, lettering, etc., as may be thought necessary, all drawn on one imperial (30 in. by 22 in.) sheet, or a model may be submitted.

The following prizes for the best two designs are offered by Messrs. J. W. Singer & Sons, Ltd., of Frome:—First prize, £20; second prize, £5.

*Class III.**

Design for a wall tablet in carved wood (the nature of the wood is left to the competitor's discretion), the area not to exceed 5 super. ft. The inscription to be in raised lettering and not to exceed fifty words, and its composition is left to the discretion of competitors, subject to its being in memory of an individual soldier who has fallen in the war. The design must be such that it could be executed for £50. It must be shown by a half-full size plan and elevation, and such full-size details of mouldings, carving, lettering, etc., as may be thought necessary, all drawn on one imperial (30 in. by 22 in.) sheet.

The following prizes for the best two designs are offered by Messrs. Martyn, of Cheltenham:—First prize, £20; second prize, £5.

*Class IV.**

Design for a wall tablet in marble or stone, the area not to exceed 6 super. ft. The inscription is not to exceed forty words, and its composition is left to the discretion of competitors, subject to its being in memory of an individual soldier who has fallen in the war. The design should include a coat of arms or a regimental badge, or both, and colour or gilt may be used in the decoration of the tablet. The design must be such that it could be executed for £25. It must be shown by a half-full size elevation, and such full-size details of mouldings, lettering, etc., as may be thought necessary, all drawn on one imperial (30 in. by 22 in.) sheet.

The following prizes for the best two designs are offered by Mr. H. A. Bartlett, Chairman of Messrs. Battiscombe & Harris:—First prize, £20; second prize, £5.

*Class V.**

Design for a simple wall tablet in wood, the area not to exceed 4 super. ft. The inscription is not to exceed forty words, and its composition is left to the discretion of competitors, subject to its being in memory of an individual soldier who has fallen in the war. The design must be such that it could be executed for £10. It must be shown by a half-full size plan and elevation, and full-size details of mouldings, lettering, etc., as may be thought necessary, all drawn on one imperial sheet of paper.

The following prizes for the best two designs are offered by Mr. H. A. Bartlett, Chairman of Messrs. Battiscombe & Harris:—First prize, £10; second prize, £5.

Class VI.

Mural painting for a boy's club. Two prizes of £10 and £5 are offered for designs for a wall painting such as might be carried out in the hall of a boy's club or board school to commemorate those from the club or school who have died during the war.

The subject of the painting may be either religious, allegorical, legendary, or an actual scene in modern warfare.

The painting may be combined with lettering for the names of the members of the club or school.

The exact conditions depend upon the hall selected, but, judging by the mural paintings already carried out in London County Council schools in East London, through the Committee of the Exhibition of Mural Painting and Decoration of Schools and other Buildings, held at Crosby Hall in 1912, a convenient size for the paintings is 12 ft. 9 in. by 7 ft. 3 in.

Two drawings shall be sent in both on imperial sheets, 30 in. by 22 in. (1) A coloured drawing of the whole panel to the scale of 2 in. to the foot. (2) A full-size figure or other detail of some part of the design.

It is undesirable that the designs should be executed in oil painting. They should be definitely of the nature of coloured drawings, and may be in tempera on paper or on canvas, or in water-colour on paper, and must not be framed or glazed, but may be mounted on pasteboard or on canvas and stretcher.

Designs selected for execution should be suitable for carrying out either (*a*) in fresco, tempera, or in some washable material on the walls; (*b*) in oil or tempera on canvas, or in tempera or body colour on paper stretched over canvas, in removable frames.

Class VII.

A fountain, architectural or sculptural, or a combination, for an open site in a country town or village, in memory of the local soldiers who have given their lives for their country in this war. The character of the design is left to the competitor, but the space for the inscription, of about forty words, must be included; it is important that this should be very clear.

Plans of two levels, a section, two elevations, and such other details as suggest themselves to the designer, may be shown, drawn on an imperial sheet (30 in. by 22 in.) to a scale of ½ in. to a foot. A perspective may also be submitted on a sheet not exceeding 15 in. by 22 in., or a model to a scale not exceeding ½ in. to a foot.

The estimated cost of execution not to exceed £200. The following prizes for the best designs are offered by the Right Hon. Charles Booth:—First prize, £20; second prize, £5.

Class VIII.

Inexpensive memorials for the "home." There is a great need for a class of memorial which will be within reach of those whose incomes are very small; at this Exhibition it is hoped to put before the public designs and suggestions of this kind, such as tablets, medallions, frames for Rolls of Honour, and photographs, caskets for mementoes or stands for holding medals, etc.

Competitors should submit finished works, models, or drawings as nearly like the proposed object as possible.

The best submitted will be exhibited in the hope that manufacturers will enter into negotiation with the authors with a view to reproduction.

These inexpensive memorials should be capable of being made in quantities at prices varying from 5s. to £2 each.

Consolation prizes will also be given by the proprietors of *Country Life* on the jury's recommendation.

---

* With regard to Classes II. to V. the right to carry out any design submitted is reserved on payment to the designer of a royalty of 10 per cent. on the value of work carried out from design.

OBITUARY.

Second-Lieut. T. P. Bausor.

We regret to announce the death of Second-Lieutenant Thomas Paul Bausor, who was killed in action in France on April 6. Deceased was the son of Mr. Paul Bausor, architect, of Lark Hall, Fordham, Ely. He served his articles with his father, and was afterwards for a time architectural assistant under the Herefordshire County Council, and later architectural assistant in the Small Holdings Department of the West Riding County Council. Soon after the outbreak of war he joined the Hereford Regiment, later securing a commission in the Shropshire Light Infantry. Mr. Bausor was the author of a lengthy article entitled "Buildings and Dwellings for Small Holdings," which appeared in two parts in our issues of April 23 and 30, 1915, together with illustrations.

Mr. C. Cox.

The death is announced from Eastbourne of Mr. Charles Cox, builder and contractor, formerly of Hackney and Stamford Hill. Deceased, who was in his eighty-first year, was for a long time one of the contractors to the London School Board.

SCULPTURED PANEL, ST. STEPHEN, COLEMAN-STREET, E.C.

We have received from Messrs. John Daymond & Son, architectural sculptors, carvers, and modellers, of Edward-street, Vauxhall Bridge-road, S.W., the following letter in reference to our article on St. Stephen, Coleman-street, in our issue for April 28 :—"The sculptured panel on the entrance gateway illustrated on page 312 was actually carved by us in wainscot oak in 1892, and is a replica of the original wood panel which was removed to the Guildhall Museum at that period. As the detail is interesting, we have pleasure in enclosing a photograph of our reproduction."

THE DUDLEY HOUSE SCHEME.

The Dudley Town Council Special Committee have issued a report in reference to the Corporation scheme for the erection of 300 houses. They had accepted tenders by the following contractors :—Mr. William Roe (Wolverhampton), for the erection of thirty houses; Mr. Thomas Higgs (Wolverhampton), fifty-four houses; Messrs. Jenkinson & Davies (Rhondda), forty houses; Dudley Amalgamated Builders (Dudley), ninety houses; Messrs. Rogers & Sons (Cardiff), eighty-six houses; Messrs. Lewis & Taplin (Birmingham), for the construction of new roads and sewers on the Brewery Fields estate (the site of the scheme), and for the widening of Bunns-lane and St. John's-road and the construction of new sewers therein. The total contract prices amounted to £81,045 for the houses and £7,127 for the roads and sewers, compared with the following estimates :—Houses, £84,471; roads and sewers, £9,624.

ty Companies and Their Halls.*

VNTO GOD ONLY BE HONER & GLORY

No. 3.

The Drapers' Company.

E Drapers' Company are third in order f precedence among the Companies, and hroughout their long history have been the most active and influential of the One of the earliest records of the Associa- ntions that the Gilda Panariorum was the Adulterine Guilds amerced in the nry II. (1180). The word "draper" ly meant a maker and not merely a n cloth, being derived from the French , which signified clothwork. In Eng- ney were called drapers and clothiers minately, the term draper being applied e who made and sold cloth in and near , the term clothier to those who brought ale from the country. Thus Stow speaks *clothiers* of England and the *drapers* of . As woollen weavers were decreasing ber, Edward III. prohibited both the of wool to other countries and the of cloth from abroad, and invited s from the Low Countries to settle in l in order that the methods of manu- might be improved. He also gave the s their first recorded charter, which that it had been shown to the King in that numbers of persons belonging to misteries, who had never been appren- r learnt the trade of drapery according good old custom of London, meddled to the enhancement of its price and ouragement of deceits. He accordingly d that none should use the mistery of in the City of London or its suburbs they had been apprenticed thereto or r manner admitted by the consent of ne mistery. Also that the misteries s, fullers, and weavers should keep to roper crafts and not meddle with the , purchase, or sale of drapery under pain risonment and the forfeiture of the r its value. Powers of oversight and were also accorded to the mistery. ember 30, 1438, Henry VI. granted the of Incorporation, which gave the s power to found and establish within y of London a guild or fraternity and a Master and four wardens to oversee overn the fraternity. Other charters ranted in the reigns of Henry VI., l IV., Richard III., Philip and Mary, th, and James I., and the Company n governed by by-laws and ordinances ne year 1322. Women were not only ed to the freedom of the Company, but arry on business and take apprentices, hen they died they were buried and l to the grave with the same rites and nies as the men. In the charter of I. the Company is described as "*Master, s. Brethren, and Sisteren of the Guild or ity of the blessed Mary the Virgin of the of Drapers in the City of London.*" Non-freemen were excluded from the drapers' trade and members were not allowed to employ them, and were enjoined on all occasions to keep the secrets of their craft. Apprentices were kept under strict discipline, and it is recorded that one John Rolls, having been guilty of a grave offence, was brought before the Master and Wardens on a Court day, and, the case being proved, two tall men, their features concealed by hoods, entered the room "with two peneworth of birchen rodds and there—w^{t} owten any word spekyng they pulled off the doublet and shirt of the said John Rolls and there upon him (beyng naked) without they spent all y^{e} seid rodds for hys said unthryfty demeano^{r}."

The charter of 17 Henry VI. recites several statutes of Edward III. and his successors relating to the subsidy on cloth, the sealing of cloth by the Alnager, the fixture of the dimensions of cloth, the form of the alnage and subsidy, and of a moiety of forfeitures of unsealed cloth, and reinforces their provisions appointing persons to enforce the law with power of search over all houses and shops in the City and its suburbs. The second of two charters granted by Edward IV. guarantees the Drapers against any concession of a charter to the shearmen, from whom it withdraws the right of search, correction, and authority over other trades, especially those of the Drapers and Taylors, unless such rights should be conceded by the Lord Mayor and Aldermen. The first of the two charters granted by James I. in 1607 enacts that, while the Master and four Wardens were to be annually re-elected, the assistants should hold office for life unless removed for some special reason. The Master and Wardens were to be chosen by a selected body of twelve assistants, all of whom must have been Past-Masters or Wardens, provisions which gave the constitution an unusually oligarchical character. Each Past-Master or Warden was *ex officio* an assistant for life. The second charter of 1619 enumerated their possessions, for which they obtained the royal acknowledgment with peaceful possession for ever and a full indemnity for all acts done in the past on payment of a fine of £206 and the reservation of rights held by the Crown.

As Cheapside was the quarter of the Mercers and Sopers-lane that of the Grocers, the Drapers mainly congregated in Cornhill, and after the coming of the Flemish weavers spread into Candlewick ward, along Birchin-lane, and almost, if not quite, as far as Stocks Market.

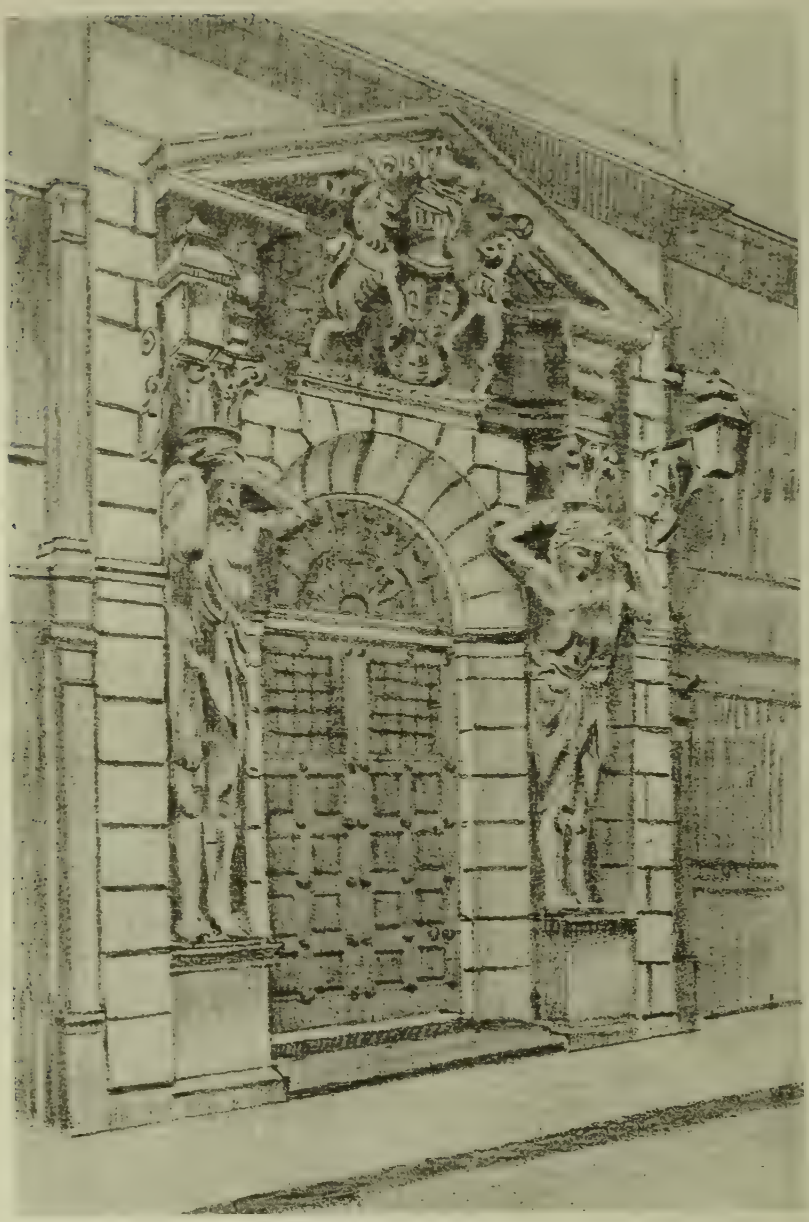
About the year 1397 Blackwell or Bakewell Hall was established in Basinghall-street as a centre for the sale of woollen cloths, the condition of admittance being the payment of certain tolls or dues. An attempt was made to give the Drapers of London the monopoly of sale there, but the municipality interfered and opened its doors to all traders. Under the first Mayoralty of Sir Richard Whittington the Ordinances of Bakewell Hall were first drawn up for the proper control of foreign drapers or clothiers. It was laid down that they could offer their goods nowhere else and only from noon on Thursday to noon on Saturday, and they were only allowed to sell whole clothes and half clothes. In 1405 the Drapers' Company obtained the right of nominating the keeper, subject to the approval of the Court of Aldermen, and for two centuries the London Drapers enjoyed profitable facilities there for the disposal of their goods; but the gradual withdrawal of members of the guild from an active share in business, the effect of the Orphan Act of 1697, and the development of commerce outside the City on more modern lines brought about a change in the methods of conducting business.

In the *Little Gest* of Robin Hood the Draper is represented as being a salesman, in contrast to the Shearman or Clothworker, and in a passage relates how Much, the miller's son, watching Long John measuring out cloth without nice regard to quantity, asks him :—"What devils kin draper" is he that he uses no "better rule"? It may be assumed that the guild sold goods in the piece or by the yard as well as in the made-up form. The "linen-draper" was at first a distinct business of itself, as for long the use of the fabric was hindered by the difficulty which foreign manufacturers experienced as compared with the English dealers in wool. An Act for burying in woollen fabrics was passed as late as 1678, and the interment of the actress, Mrs. Oldfield, in a Holland shift is noted in 1730 as a remarkable occurrence; but the Drapers, like many other of the great Companies, ceased to have a practical connection with the trade which gave them their name and wealth as modern conditions brought with them changes which rendered their task of trade superintendence unnecessary.

The earliest accounts in the possession of the Company date back to 1415, in which year the number of members exceeded 100, the income of the year being £37 15s. 6d., derived from the rent of houses, assessment for processions, fees for apprenticeship and freedom, and for fines and quarterage. The expenditure for the same period was £23 12s. 6d., which includes the beadle's salary, the expenses of the trade searches, payments to chaplains, and repairs of houses, as well as payments for minstrels, hire of horses, and other items. The fees for the admission of apprentices increased from 3s. 4d. in 1476 to 20s. in 1498, in which year thirty-five were admitted. The records contain numerous accounts of the part played by the Company in royal processions or pageants. When Henry VII. made a triumphal entry into London after his victory over the northern rebels, and also on the Coronation of the Queen, the Companies were called to add to the splendour. In reference to the first of these occasions the entry occurs, "Remembrance, that the crafts was cessed for xxx persones to ride to sette in the Kinge; whiche cessing draweth to the Somme of xv^{li} vj^{s} ij^{d} whereof

---

rticie on the Mercers' Company appeared in e of March 31 and one on the Grocers' on April 28.



Drapers' Hall : Main Entrance, Throgmorton-Street.

we receyved but the Somme of xij ix ij," from which it appears the fraternity were out of pocket by the observance of their loyal duty.

In 1521 the Drapers took a leading part in settling the terms and amount of contributions which the Government required for the furnishing of ships of discovery to be placed under the command of Sebastian Cabot. The Wardens of "divrs of the auncyant felishippes" assembled at "Frers Austyn," and practically adopted the Drapers' Company answer as their own. The Drapers told the King's Council that they had no authority to bind the whole Company to any such charge and described the condition of their trade—their Company consisted of but "fewe adventurers saving only unto Flanders whereuntoe required noe grote shippes"; yet if it pleased the King to cause to be manned, rigged, apparelled, and victualled "such a ship as the Company should think convenient, the Wardens would apply themselves and labour their said Company to freight and lade the same to the best of their power, having such a reasonable price of the freight as other shipps had in usuage and lading."

The intended voyage seems to have been to Newfoundland, which had been first discovered in 1491 by John Cabot, Sebastian's father, whose ships were furnished by the London merchants. The Drapers did not like the venture, and pointed out that neither the land to which the vessels were bound nor the "seey thitherward and homeward" was known, that it was a "sore adventure to jepard ye shipps with men and goods unto the said island upon the Singular trust of one man alone," who, as they had heard, was never in the land himself. They finally submitted on a message "fro my Lord Cardynall," "that the King would have the promises performed and would have no nay therein."

The suppression of the monasteries is first hinted at in an entry in the year 1538, stating it to have been agreed "as touching the purchasing of suppressed lands that this house shall not be hasty for doubts that may be thought to depend on the same, for holding of the Kyng, as by knights service or such other like, untill it be discussed by learned counsell." In 1545 the Company completed the purchase from Henry VIII. of the site—their present site—which had come to the Crown by the attainder of Cromwell, Earl of Essex, whose residence it had been. They were required to submit a general account of their chantries, and defined the heads of an agreement as to those they were left to maintain. The Company rallied with unusual rapidity from the damages and losses occasioned by the Fire, and in Maitland's "History of London," written in 1756, it is recorded that the Company spent yearly in charities a sum of £4,000, an amount in excess of that of any other Company.

Many eminent men and families have been connected with the Company or trace descent from members of the fraternity, among whom are the Pulteneys, Earls of Bath; the Capels, Earls of Essex; and the Brydges, Dukes of
Chandos ; and they have included among t
members many who have been distingui
for their municipal energies and benefact
Among notable members of the Company
John Hind, Mayor in 1405, restorer of
Swithin's Church, whose house in St. Swith
lane was the first Hall of the guild and is
its property ; Sir Simon Eyre (1446), the fou
of Leadenhall Market and donor of 8,000 m

find that the Drapers have founded
ses—the Queen Elizabeth's College
h, founded and endowed by William
1575, which supports forty alms-
Bruce Grove Almshouses at
founded under the wills of John
681, Sir John Jolles in 1617, and
manson in 1695; the St. Mary,
Almshouses, twenty-four in number;
ge, Southwark, Almshouses, sixteen
; the St. Leonard's, Shoreditch,
at Wood Green, which were
1658 and 1725; and the Lucas
Hospital, Wokingham, founded under a bequest dated 1663. The Company also administer various apprenticeship and pension trusts.

Several large and important schools, amongst which are Bancroft's School at Woodford, Essex, founded under a will dated 1727; the Thomas Corney's School at Tottenham; Howell's School for Girls at Denbigh; and a number of exhibitions are also directly administered by the Company, which by new buildings and in other ways has frequently added to the benefactor's munificence.

The Drapers are also connected with many other institutions and foundations, and have seats on the governing bodies in recognition of sums they have given. Among these are the Sir William Boreman Foundation, the income of which maintains 100 boys in the upper division of the Greenwich Hospital School. They are selected by examination from boys attending public elementary schools in Greenwich. The Kirkham Grammar School, Howell's Glamorgan County School at Llandaff, University College, London, and the University Colleges at Bangor and Cardiff, to which the Company has presented libraries costing £15,000 each, the Universities of Sheffield and Leeds, and the Whitechapel Art Gallery are institutions to which the Company has given support.

But the most important and useful work which the Drapers have done for education is probably that in connection with technical education. It was amongst the Companies which subscribed towards the foundation of the City and Guilds Institute, which marked the commencement of a movement for the furtherance of technical education in England, and, though it broke off its connection with the City and Guilds Institute in 1888, it was with a view of undertaking other and much-needed duties of a similar kind. The institution with which it is specially connected is the People's Palace in the Mile End-road, which was the outcome of Sir Walter Besant's imagination and enthusiasm, but which, with the support and direction of the Company, now forms a very valuable educational unit in a district in which it is most required. The recreative side consists of the Queen's Hall, where concerts and entertainments are provided; a Winter Garden, given by Lord Iveagh; and a recreation hall, to which is now added an evening play centre for children. The educational section is now known as the East London College, where a full course in arts, science, or engineering can be obtained for 10 guineas per annum. The College course is taken by over 200 day and 130 evening students, and the degrees obtained by students are evidence of the value of the educational facilities afforded. The whole of the educational buildings have been erected at the cost of the Company, which also contributes £9,000 a year towards the College and awards scholarships. Altogether the Drapers' Company have contributed over £280,000 towards this great educational and philanthropic work. The support of the Company is given to the Department of Agriculture at Cambridge; the Department of Applied Science at University College, London; the Mining Departments at Sheffield and Leeds; and the Engineering Departments of the University Colleges of North and South Wales. The Drapers' Company thus has given a wide support to technical and general education; while the Clothworkers' Company have confined their attention more especially to the technical processes in connection with the dyeing and weaving industries.

It will be seen from our brief review that an association originally formed to safeguard and advance the interests of a special trade now fills what is in reality the more important part of a great educational department, administering a large income, for the most part consisting of funds as to the allocation of which they are unfettered, for the promotion of the public and national welfare, and the work of such a body cannot fail to be of the greatest potential value in our educational system. Added weight and interest are afforded to the cause of education by the voluntary support and independent action of a community of private individuals whose work is inspired by enthusiasm and a desire to further the public good.

LAW REPORT.

Action against a Building Committee: New Church at Laira, Plymouth.

In our last issue we gave a brief report of an action which arose out of the erection of St. Mary's Church, Laira, Plymouth, commenced at the Western Law Courts recently. The plaintiffs were Mr. John William Hamilton and Messrs. Pethick Bros., contractors, and the defendants, the Church Building Committee.

Plaintiffs claimed the sum of £952 3s. 7d., balance of amount for work done by Messrs. Pethick Bros. and for goods supplied, damages for alleged wrongful repudiation of contract, and delivery of plant and material belonging to Messrs. Pethick Bros., or damages for its detention. Defendants denied liability, and counterclaimed £303 11s. 11d. as liquidated damages for non-completion of contract.

The case came before the Official Referee (Mr. E. Pollock, K.C.), and counsel engaged were: For the plaintiffs, Mr. A. A. Hudson, K.C., and Mr. Arnold Inman, instructed by Messrs. Soames, Edwards, & Jones, London; for the defendants, Mr. Clavell Salter, K.C., and Mr. H. Geen, instructed by Messrs. Prance & Prance, Plymouth.

Counsel for the defendants, in the course of his opening statement, said the contractors largely confined their energies to asking for money. In September, 1911, they were already getting behind, and were being pressed to show more promptitude and despatch. The contractors gave as one reason that they were unable to obtain Bath stone, but the trouble was that they could not pay for it. Pethick Bros. were "hard up," and were continually pressing the architect for a certificate for payment, and the architect strained his discretion and let them have it in driblets. The contractors did not make any real attempt to do the work in accordance with the contract; they were trifling with it. As the time for completion approached letters were written to the contractors complaining of the "extreme dilatoriness" of the work and the insufficient number of men employed, and warning them that if the contract was not completed to time the penalties incurred would be enforced. With reference to the point that the work was interfered with by the cutting of a new road by the local authority, making it necessary for the contractors to gain access to the site by an alternative route, the impediment was a very small one, for one route was practically as good as the other.

In consequence of the slow progress of the work the architect declined to exercise further his discretion to issue certificates for less than £250. The contractors subsequently gave notice that unless they received the payment demanded they would stop the work. On August 30, 1912, the contractors, who had been treated with extraordinary forbearance, were given notice under Clause 26 that unless they proceeded with the work with reasonable expedition and despatch the contract would be determined. The plaintiffs contended that Clause 26 could not be put in operation if a certificate was withheld by the architect when due. The only question was whether the architect was of opinion that, having regard to the way in which the work had been done and the amount of work done, a certificate for £250 should be withheld. The architect was of opinion that he ought not to certify, and he refused to do so. The question for the Official Referee was not whether the architect was right in his opinion, but only whether he was honest in his opinion. After receiving the notice under Clause 26 the contractors failed to hasten the work, and it was obvious that they could not get credit from a slate company. They therefore suggested that another firm should do the slating, but the architect replied that he could not consent to the transfer of part of the contract to someone else.

Evidence was given by the clerk of works, Mr. W. Martin; the architect, Mr. T. Rogers Kitsell; and others.

Mr. Hudson, in his final reply, described as "absurd tarradiddle" the architect's statement that he made deductions from the amounts due to the contractors because of faulty work.

Counsel completed his address in London. The arbitration was concluded in the Official Referee's Court on Monday last. The proceedings consisted mainly of the summary of evidence and arguments already adduced.

Summing up, the Referee conceded all the principal points of the plaintiffs' case.

Judgment was given for plaintiffs for £816 11s. 11d., with costs, and also on the counterclaim, with costs.

THE BUILDING TRADE.

THE LUMSDEN JUDGMENT.

UNDER this title the *Land Union Journal* for April, 1916, publishes an article by Mr. E. P. Hewitt, K.C., which contains a suggestion of interest to the building trade.

The author, after a short review of the case in question, remarks that if it be taken for granted, according to the rule adopted in the Lumsden case, that the statute requires a new gross value to be ascertained on the occasion, it follows that where it is found as a fact that the gross value on the occasion is smaller than the purchase price, while the full site value is the same as the original full site value, increment will appear. He then points out that the simplest way of avoiding the difficulty caused by the decision in the Lumsden case is for landowners to resist attempts by official valuers to put the gross value on the occasion of a sale at a figure lower than the purchase price. To find out what price a property actually will fetch must be the best mode of ascertaining its market value. Such a test is superior to the estimate of any surveyor, however eminent; and the contention that the "fancy price," as it is sometimes called, which an individual (*e.g.*, a next-door neighbour) may for special reasons be willing to give, should be disregarded is unsound.

In support of this view he quotes the decision in Inland Revenue Commissioners *v.* Clay and same *v.* Buchanan ([1914], 1 K. B. 339; 3 K. B. 466), in which a higher price was paid for a property adjoining a nurses' home by the trustees of the latter because they wanted to enlarge the accommodation of the home. The decision was upheld in the Court of Appeal. The Master of the Rolls in the course of his judgment said: "An 'open market' sale of property 'in its then condition' presupposes a knowledge of its situation with all surrounding circumstances.

"To say that a small farm in the middle of a wealthy landowner's estate is to be valued without reference to the fact that he will probably be willing to pay a large price, but solely with reference to its ordinary agricultural value, seems to me absurd. If the landowner does not at the moment buy, land brokers or speculators will give more than its purely agricultural value with a view to reselling at a profit to the landowner." And Mr. Swinfen Eady, L.J., in his judgment said: "The market is to be the open market, as distinguished from an offer to a limited class only, such as the members of a family. The market is not necessarily an auction sale. The section means such amount as the land might be expected to realise if offered under conditions enabling every person desirous of purchasing to come in and make an offer, and if proper steps were taken to advertise the property and let all likely purchasers know that the land is for sale."

The author remarks that this decision is of the very first importance, and places any owner of land in a strong position for requiring, in any ordinary case, that the figure at which the gross value of his property is put, for the purpose of arriving at the site value on the occasion of a sale, shall not be less than the purchase price; and, in cases where the property is subject to fixed charges or restrictions, that the gross value on the occasion shall be put at a higher figure than the purchase price.

If landowners adopt this attitude and insist upon the rule laid down in the cases of Clay and Buchanan being adhered to any hardship arising from the decision in the Lumsden case will, in practice, be reduced to very small dimensions.

THE SURREY TILE.

With reference to the notice of the Surrey Roof and Weather Tile, which appeared in our issue of April 28, in mentioning the principle of the invention we referred to the "interspace" tile; this should read as "inter-tile-space."

NEW GOVERNMENT CONTRACTS.

War Offices.

Bricks (Term Contracts).—B. J. Forder & Son, Ltd., Pillinge Brickworks, Wootton, Bedford; London Brick Company, Ltd., 14, Archway-road, Upper Holloway, N.; Smeed, Dean, & Co., Ltd., Sittingbourne, Kent.

The mason's rate given is for bankers; fixers usually ½d. per hour extra.

* War bonus of 2s. per week granted. † War bonus of 3s. per week granted.

for permission to borrow £1,977 excess expenditure in connection with the extensions of the public baths.

Blackpool.—The following plans have been approved by the Blackpool Building Plans Committee:—Mr. H. C. Turley, one house, Dagger's Hall-lane; Messrs. F. & C. Smith, additions and alterations, Coronation-street; Mr. F. Hardisty, cart shed, Devonshire-road; Mr. M. Bramhall, additions, Ripon-road; Mr. M. Burton, motor house and greenhouse, Park-avenue; Blackpool Laundry Company, petrol stores, New-road.

Bo'ness.—At a recent meeting of Bo'ness T.C. a letter was read from the Secretary for Scotland, in which he stated that he was prepared to sanction the borrowing of an additional £12,000 for the extension of Bo'ness Electricity Works.

Bristol.—The Bristol Health Committee has approved of a scheme for the erection of nineteen houses near Avonmouth Docks for the use of employees engaged in dredging work.

Cairo.—A recent meeting in the Residency discussed the question of the erection of an Anglican Cathedral at Cairo.

Coatbridge.—Coatbridge Dean of Guild Court has granted plans for the extension of Speedwell Ironworks, at an estimated cost of £3,000.

Dewsbury.—A meeting of the members of the local Textile Workers' Union was held at Dewsbury recently to consider the desirability of purchasing a new Trades Hall, at a cost of about £2,000. It was decided to purchase a four-story warehouse in Union-street, with a view to the remodelling of the premises as union offices and club-rooms.

Eastry.—The R.D.C. has approved a plan submitted by Messrs. G. H. Denne & Son for a temporary dormitory at Sholden Lodge temporary war hospital.

Exeter.—The Sanitary Committee of the City Council reports the completion of the purchase for £500 of a site of about 3 acres, between Alphington and Ide, for a smallpox hospital.

Glasgow.—Linings granted at Glasgow Dean of Guild Court:—Messrs. G. & J. Weir, Ltd. engineers, to erect buildings at the junction of Newlands-road and Franklin-road, Cathcart; the New Savoy Theatre, Glasgow, Ltd., 79, West Regent-street, to make alterations in Hope-street and Renfrew-street; and Archbishop Maguire and other trustees of the Roman Catholic Archdiocese of Glasgow, to erect a school in Muslin-street, Bridgeton.

Golborne.—The Catholics of Golborne have been contemplating building a new church, to take the place of the one in Church-street. Land has been secured in High-street, near the Parkside Mills, and funds are being raised in aid of the proposed church.

Hammersmith.—The B.G. has granted a site in the grounds of the workhouse and infirmary for a building for Church of England services, provided that the building erected thereon shall be of a permanent character and no cost should fall upon the ratepayers of Hammersmith, and that the building be subject to the approval of the Board.

India.—The Government of India has sanctioned a University for Mysore.

Kirkheaton.—At a recent vestry meeting held in connection with the Parish Church it was reported that a substantial sum has been set aside for the provision of a new heating apparatus.

Langport.—The Langport Town Trust has referred to the Building Committee the question of renovation and redecoration of the Town Hall.

London.—The Metropolitan Drinking Fountain and Cattle Trough Association is to erect thirty troughs and twenty fountains in London during this year. Plans have been sanctioned for alterations proposed to be carried out at the Morning Star beerhouse, 231, Rye-lane, Camberwell, Mr. A. C. Bampton, licensee; and the beer, spirits, and wine off-licensed premises, 691, Old Kent-road, Camberwell, licensee, Mr. C. H. Gray.

Manchester.—At a recent meeting of the City Council it was stated that it was intended to spend £290 in altering the ruin on the old infirmary site for a library extension.

Merriden.—Plans passed by the R.D.C.:—New billiard-room and kitchen for Mr. W. W. George, Marston Green, Bickenhill; alternative drainage system for two new houses, Coleshill-road, Marston Green, Coleshill, for Mr. T. F. Gibbs; two shops and a house near the Bell Inn, Tile Hill, Berkswell, for Mr. J. G. Tommy, of Burton Green, Kenilworth; new chapel at St. Gerard's Hospital, Coleshill, for the Rev. G. V. Hudson, of Coventry-road, Coleshill; additions to children's camp at Corley Moor, in Mr. Browett's field, for the Coventry Children's Care Committee (Mr. A. E. Robinson, Education Office, 44 Bailey-lane, Coventry).

Middlesbrough.—The Plans Committee of the Corporation has passed plans for four new houses in Beckon-hill-road and Tavistock-street, also alterations to office premises in Albert-road.

Motherwell.—Motherwell Dean of Guild Court has passed plans presented by Mr. Hugh N. Bryden for the erection of a picture house near the Cross in Brandon-street, to give accommodation for 834 persons.

Perth.—The T.C. has had under consideration several schemes with a view to the improvement of the city water supply. The Special Water Committee has decided to accept an estimate for the sinking of an experimental artesian well at a cost of between £800 and £1,000.

Plomesgate.—At a recent meeting of the R.D.C. the Public Health Committee reported that repairs are needed to some cottages at Butley and Rendlesham.

Portobello.—Edinburgh Dean of Guild Court has granted warrant to Edinburgh Corporation for the erection of the first section of the new electric light station at Westbank, Portobello.

Ripon.—Subject to the approval of the L.G.B., the Ripon City Council have accepted tenders amounting to £9,242 for the proposed improvements of the Corporation gasworks.

Rochford.—The L.G.B. has held an inquiry in connection with the application by the R.D.C. for the sanction to borrow a further sum of £3,500 for works of sewerage and sewage disposal for the parish of Rochford.

Southowram.—The D.C. has approved plans for alterations to stable, etc., for Messrs. R. Whitaker & Sons, Ltd., at the Cock and Bottle Inn.

South Shields.—Plans for the new infectious diseases hospital at Cleadon have been prepared by the Borough Engineer.

Standish.—At the annual vestry meeting of the parishioners of Standish plans for a proposed new chancel screen, prepared by Messrs. Austin & Paley, church architects, of Lancaster, were submitted.

Stokesley.—A plan of a house proposed to be built at Hutton Rudby by Messrs. J. T. Tarran & Son has been approved by the R.D.C.

Warrington.—Town-planning preparations are to be taken in hand by the R.D.C., in readiness for definite action after the war. The L.G.B. has informed the Electricity and Tramways Committee with regard to its application for sanction to the borrowing of £9,536 for extra boiler accommodation at the electricity works, that it will be prepared to sanction the loan required for that purpose, and that in order to save time the work may be put in hand. The engineer has been authorised to advertise for plant, etc., and also to engage Mr. Percy Silcock to prepare the necessary plans.

West Ham.—Plans for alterations at the Essex Arms, Victoria Dock-road (licensee, Mr. H. C. Rhodes), have been approved.

Wick.—At a recent meeting of Wick Harbour Trust it was intimated that the new harbour improvements would be commenced about the middle of June, the advance of £30,000 having been passed by the Treasury.

GENERAL BUILDING NEWS.

NEW BATHS, TORQUAY.

The new medical and swimming baths erected on Beacon-hill, Torquay, at a cost of £15,000, were opened recently. The medical baths are in the Bath Saloons, a portion of which building has been reconstructed for their installation, and the large swimming bath is on an adjacent underground site. There are fifteen baths altogether, including seaweed, deep, vapour, needle, douche, electric, and reclining baths, and attached to each bath there are two or more dressing-rooms. There is an outdoor promenade which can be quickly reached from the cooling chamber. The swimming bath, 100 ft. long and 30 ft. wide, is constructed at the east end of the large saloon, and has been built with its roof on a level with the roadway. The depth of the bath is graduated from 4 ft. in the shallowest part to 7 ft. at the diving-stage end. Arranged round the sides are forty-seven dressing-boxes, with two shower-baths, one at each angle, and a staircase on either side leads to a commodious gallery for audiences on special occasions. The construction of the new baths has been carried out from the designs of Mr. Alfred J. Taylor, M.S.A., architect, Bath.

TUBERCULOSIS HOSPITAL, CARNARV

The new Tuberculosis Hospital a Seiont, Carnarvon, erected by the National Memorial Association, was opened by Mrs. Lloyd George. The formerly a private residence, provide modation for twenty-four patients. with patients' and staff dining-roo kitchens, nurses' and servants' qua hot-water boiler and disinfecting a are provided in an annex, and the out have been converted into a washhouse, drying-room, electric power-house, n etc. The establishment is lighted by light by plant provided by Messrs. Lance & Co., of Llandudno. The wards, to the north-east of the hospital accommodation for fifteen patients, with the necessary duty-rooms, bath rooms. In front of the detached a verandah. The detached wards Messrs. Humphreys & Co.'s patent con The painting contract was sub-let to Thomas, Carnarvon. The architect Jos. Owen, F.R.I.B.A., of Menai Bridg

PATENTS.

APPLICATIONS PUBLISHED.*

4,951 of 1915.—Moritz Kahn and Alan Wilfrid Ruddle : Floors, roofs, and similar portions of building structures.

5,111 of 1915.—Strachan & Henshaw, Ltd. and Tom Sargent : Discharge shoots for filling skips, buckets, and the like.

5,186 of 1915.—George Shaw : Means for actuating dock gates.

5,227 of 1915.—Frederick Thackeray : Curved travelling templet or shield with shaft, hinged at the centre points of movements for the construction of domes.

6,157 of 1915.—Andrew Edward McKean, William George Trethewey, and Claude Charles Plucknett : Fastenings for hinged or pivoted windows and the like.

6,333 of 1915.—Edward Johnson and William Boulton, Ltd. : Tile and like presses.

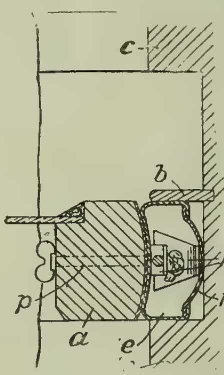
10,643 of 1915.—Joseph Brewin : Method of making salt-glazed stoneware pipes, gullies, traps, and the like, to prevent blisters rising after such are made.

13,851 of 1915.—Benjamin Moon Hodges and Henry Hodges : Ladders.

SELECTED PATENT.

21,546 of 1914.—Joshua Brittain and Herbert Charles King : Windows.

This relates to pivoted-sliding windows in which the sash *a* is pivoted to a metal box-like member *e* which slides between the beading *b* and the frame *c*. The contracting surfaces of the sash and member *e* are curved, and a convex plate *m* closes the box member *e* bears against the face of the pulley stile. member *e* is closed at the top by a cap wi passage to allow for the passage of the cord. The pivot is controlled by a sprin The sash is locked in its closed position screws *p*.



21,546 of 1914.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

CX.—No. 3824. MAY 19, 1916.

THE COMMERCIAL VALUE OF DESIGN.

WE have the reputation of being a commercial nation, and were contemptuously described as being "a nation of shopkeepers" by the great Corsican; but whether the charge is well founded or not, we have never understood
od design has a commercial value which it is wise to
se and that good art represents good business. Apart
ıe value which houses may owe to site and position, we
ıtly hear of large prices being given for them because
ın be described as being "designed throughout in the
manner" or containing "genuine eighteenth-century
ıg and chimney-pieces." And the fact that value is
o such buildings is not due alone to their antiquity,
iquity in building by itself is not an asset which has
ıe value that it possesses in the case of a book, a curio,
icture, but conveys the recognition that the buildings
ich people are willing to pay prices in excess of the
c commercial value of site and accommodation contain
ing which gives the purchaser pleasure and satisfaction,
mething being a definite artistic value.

ning to more recent times, the fact that a house was
d by Norman Shaw would always be stated in an
particulars of sale, because he would know it would
ute an inducement to the purchaser; while he would
nk it advisable to state that the house was beautifully
d and well planned by a well-known architect in 1865,
e such a date would not prove an attraction to the
e purchaser.

is therefore clear that design has an intrinsic value
rcially, and the recognition of the fact should be borne
d by all those who are building either for themselves
speculative purposes. A man who builds a house for
wants it to suit his tastes and requirements, but, since
esents capital, in most cases he will wish to have a house
can, if necessity arise, be resold.

iety and originality by themselves do not necessarily
uilding this commercial asset, for many houses built
period between 1850 and 1880 have both in a
greatly in excess of that possessed by the average
an or Adam house, and there is many an old town in
the front doors of house after house follow the same
design almost without variation.

same point applies to the design of such fittings as
and door-furniture, in which it can be said, without any
contradiction, that if our leading manufacturers ceased
nine-tenths of their stock, and only put on the market
esigns as had met the approval of those who possess
nd knowledge, they would be the gainers, for the specula-
uilder, as far as his knowledge goes, will try to buy a
class of fitting to that used in a better-class house.
ference is that economy would be promoted by cutting
stocks and ceasing to place on the market a plethora of
ntly and badly designed fittings the novelty of which
ppeals for a time to the ignorant. Similar considerations
in the design of wall-papers; there is absolutely no
why a good design should be scrapped at the end of
n, or why the expense of the production of an enormous
r of fresh designs should not be saved. Manufacturers
do well in this period to consider whether it is not worth
o work in more intimate conjunction with architects and
artists, and whether they cannot produce goods of
greater merit and at the same time save the enormous
involved in the production of ephemeral novelties. There are a few firms of grate manufacturers who are now selling goods made from designs produced twenty or thirty years ago, while the bulk of the work of their contemporaries at that time would find no sale at all. The enormous sales of old grates and mantelpieces would be checked by an improvement in the standard of design of modern work, for a comparatively small number only would be bought and sold if their only advantage over modern work was that given by their greater age.

It may be said that if one-tenth of the well-directed effort which has been employed in improving sanitary fittings and appliances for cooking, heating, and other practical objects were directed towards improving the design of ornamental and architectural accessories in building the standard of the applied arts connected with building would be radically altered, and this can only be done by the intelligent and sympathetic work of both artist and manufacturer.

What is required, briefly, in the interest of commerce as well as that of art, is co-operation between the manufacturer and artist; and the commercial importance of a better understanding between architects and builders is also evident if we consider what might be gained by it.

We cannot, if we would, replace the speculative builder or reach the happy age when no building will be erected except from the designs of an architect; but builders of education and experience can do the cause of building much good by showing their comrades whose enterprises are on a smaller scale the advantage of obtaining some amount of technical help. Many a small builder has erected house property which has let or sold well for a short time and then become unsaleable in the market because of defects of design. And yet the expense of obtaining a design for a type or types of house suitable for his purpose, and which could be repeated to a large extent, is very small even if the aid of an architect of some standing is sought. Such co-operation would be to the advantage of architect and builder alike, and would be a boon to the general public and save many localities from wholesale desecration. There are also ways in which the architect can help the builder by restraining and controverting the fallacy which we hear so much of now, the socialistic remedy of carrying out housing schemes by the direct means of municipally directed labour, without the agency of the contractor and at the cost of the ratepayer. These schemes are the outcome of inexperience, but, if the arguments on which they are based are allowed to go uncontradicted, may be productive of legislation which will press heavily on the resources of the country at a time when it will need them most. Unchecked competition has, to a great extent, had its day, and our task in the future is rather to discover how far we can obtain co-operation between those whose interests lie in the same direction, thus diminishing expense and producing the best results.

Art has become too much an individual product in the present age, and it is clear that while men of great individual talent are among us now, and artistic criticism has never been so plentiful, there is a reluctance to realise that more co-operation and less individualism might lead to better results. Many architects will insist on designing a wrought-iron gate in all its detail when a better result would be produced by a good smith who was allowed to work in co-operation with the architect from a small-scale sketch. In the one case the smith is reduced to the status of a mechanical worker, in the other he has scope for the development of his powers of design and suggestion, and, if asked to supply a gate independently, the purchaser has the advantage of the experience he has gained by independent thought.

The architect will probably work better if he has not to concern himself with all minutiæ of craft design, and the result of the process intelligently carried out will be the education of a greater number of designers and the establishment of a method of working which is nearer to the conditions prevailing in what we are apt to consider the golden days of artistic production; and while it matters little how the best result is produced, it matters greatly to the world that the best result should be effected. The value of good work is dual—its direct result and its educative influence on future work—and occasionally the last is forgotten.

And we should also like to see a better understanding exist
in the future between two schools of architectural thou
the one the revival of the academical methods and dilettan
the late eighteenth and early nineteenth century, in which
was the sole consideration; the other the arts and
movement, which has possibly concerned itself too exclu
with the resuscitation of the means by which the minor
of mediæval texture and quality can be reproduced.
have their great value in adding to the sum of modern
art, and both should join forces in endeavouring to
the commercial classes to a recognition of the all-imp
truth that architecture and the other arts are comme
important—a truth which cannot be over-estimated
commencement of the new era which will lie before us
conclusion of the present war.

NOTES.

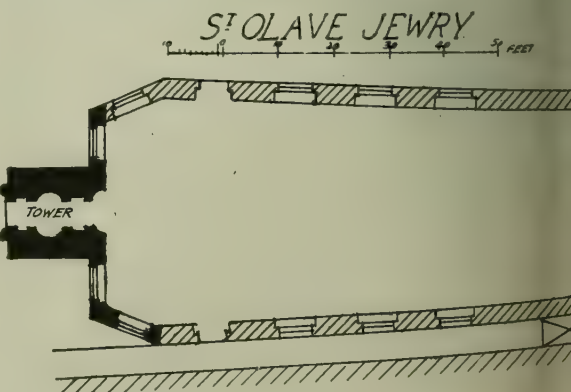
Aircraft Insurance. There are many surprises in store for the public in connection with the State system of insurance against damage inflicted by the enemy by aircraft and bombardment, and one of these was disclosed in a question put to the Government in the House of Commons on May 8. The question was whether a claim under a Government policy had been rejected on the ground that the assured had signed a coupon issued by a daily paper insuring him against damage from aircraft and had not exhausted his rights against this paper. The reply on the part of the Government was that a newspaper insurance coupon is as much an existing subsisting insurance as any other policy, and the claim against the newspaper must be exhausted before the Government was liable on the official policy. According to the questioner's statement, the assured in this case had failed in his claim against the newspaper because he had made it out of time, and apparently the Government is to benefit by this slip. In a recent case in the House of Lords, relating to the forms under the Finance Act and land taxation, one of their lordships characterised the action of the Government Department which issued the form as more befitting a company promoter than a Government Department. Is the same observation to be applied to the system of Government insurance? This form of insurance is an entirely new departure. Hitherto taxation for the maintenance of the Navy and Army has always been justified on the ground that citizens must pay for the security afforded them by these forces. The security is absent, and the insurance premiums are an additional form of taxation to secure indemnity against a form of damage which it has always been assumed the Government in a civilised State could and would provide against. The new system has been loyally accepted by a long-suffering and law-abiding people, but let us hope that it will not be administered in a pettifogging spirit. There are other objectionable clauses in the policies issued under the Government scheme, but we cannot refer to them in this note.

A School of Landscape Architecture. American Universities aim at thoroughness, and every facility is given for the acquisition of knowledge of various kinds. We have before us a prospectus of the School of Landscape Architecture, instituted in connection with Harvard University, the staff of which consists of a professor, an assistant-professor, an instructor in Horticulture, an instructor in Landscape Architecture, a lecturer on Landscape Architecture, and a librarian. Instruction to students is also given by the Dean of the Faculty of Architecture and the instructors in Architecture and the Fine Arts. The degree of Master in Landscape Architecture is given to students who satisfy the examiners in the following subjects:—1, Landscape Architecture as a Fine Art; 2, Practice in Design, Estates, and Related Problems; 3, Design—Park and City Planning; 4 and 5, Principles of Construction; 6, The Nature and Management of Trees, Shrubs, and Herbaceous Plants; 7, 8, and 9, Plants in Relation to Planting Design; 10, Principles of City Planning; and 11, Elementary Drafting. Besides all this, the student is advised to take a wide course of a more purely architectural kind. There is one consolation to the student who seeks future fame, which is that a prospectus sounds more formidable than actual experience proves it to be. Still, Strafford's motto, "Thorough," is reached, to our minds, by the foregoing little list, which we find in a prospectus of sixty pages!

The Manchester Society of Architects. The annual Report of the Manchester Society of Architects is like that of the R.I.B.A., on a diminished scale. The membership is 272, and among those who have volunteered for active service the Council regret to have to announce two deaths—those of Mr. George Barlow, Associate, killed at Gallipoli, and Mr. C. R. Edwards, student, killed in France. In all, seventy-nine members (Fellows, Associates, or students) have joined his Majesty's forces in various capacities. The Society's deputation to the City Council on the subject of Official Architecture is carefully and well drawn up,
but no answer has yet been sent them, though it is stated the
tion was sympathetically received. The Council has been
in conjunction with the Architects' War Committee in Lond
a scheme of civic survey has been formed, with Professor Aber
and Mr. Isaac Taylor as co-directors, which has found work fo
Manchester practitioners who are making a comprehensive
survey of South-East Lancashire and the surroundings of Li
It is to be hoped that next year we may be able to rec
resumption of full professional activities; at present the re
every professional body is somewhat gloomy and monotonou

Russian Trade. A Russo-British Trade Exchange has been
the object of which is to establish in Mosc
in London exchanges where the products of
countries can be sold—Russian products in
and English products in Russia. The idea is to have e
showrooms which will be permanently open, and also office
modation which can be let for temporary uses. The Trade E
will provide all services, including, in Moscow, the prov
Russian staff, competent assistants, travellers, agents, and l
together with an Anglo-Russian clerical staff. The showroo
be divided into sections for various trades. Floor space
charged on a rental basis—it is suggested 100 sq. ft. at £
year, including all services and representation. The p
rentals, even with the services included, strikes us as being so
high for permanent exhibitors, but that is merely a point of de
does not militate against the merit of a well-conceived pla
address of the Exchange is 16, Regent-street, London, but it is
out that it has no connection with the Russian Chamber of Co
which occupies offices at the same address.

A Suggestion. It has sometimes occurred to us when we hav
of some striking instance of the passion of an
Government to show its fairness by neglect
interests of British subjects that it would be an excellent pl
could become aliens—we do not say alien enemies. We be
this could be effected, our trade interests would more often
a matter of concern to the Government of the day, who wo
they were free from any suspicion of favouritism. Meanw
Hughes's eloquent arguments show the greater clarity of visio
comes to those who have learnt to understand wide issues,
becomes increasingly difficult to reconcile old theories whi
been recognised as established truths with the practices
trade rivals. We could not believe in the possibility of war
was forced upon us, and it sometimes seems that we shall not
in the possibility of that great trade war which will inevitabl
the conclusion of peace until we have to face the strugg
more unprepared. Though we hope for the best, there is an i
amount of prejudice and inertia to overcome if we are to h
own commercially when peace comes, and there is room fo
spadework if we mean to make up leeway.



Wren's Churches. (*See page* 365.)

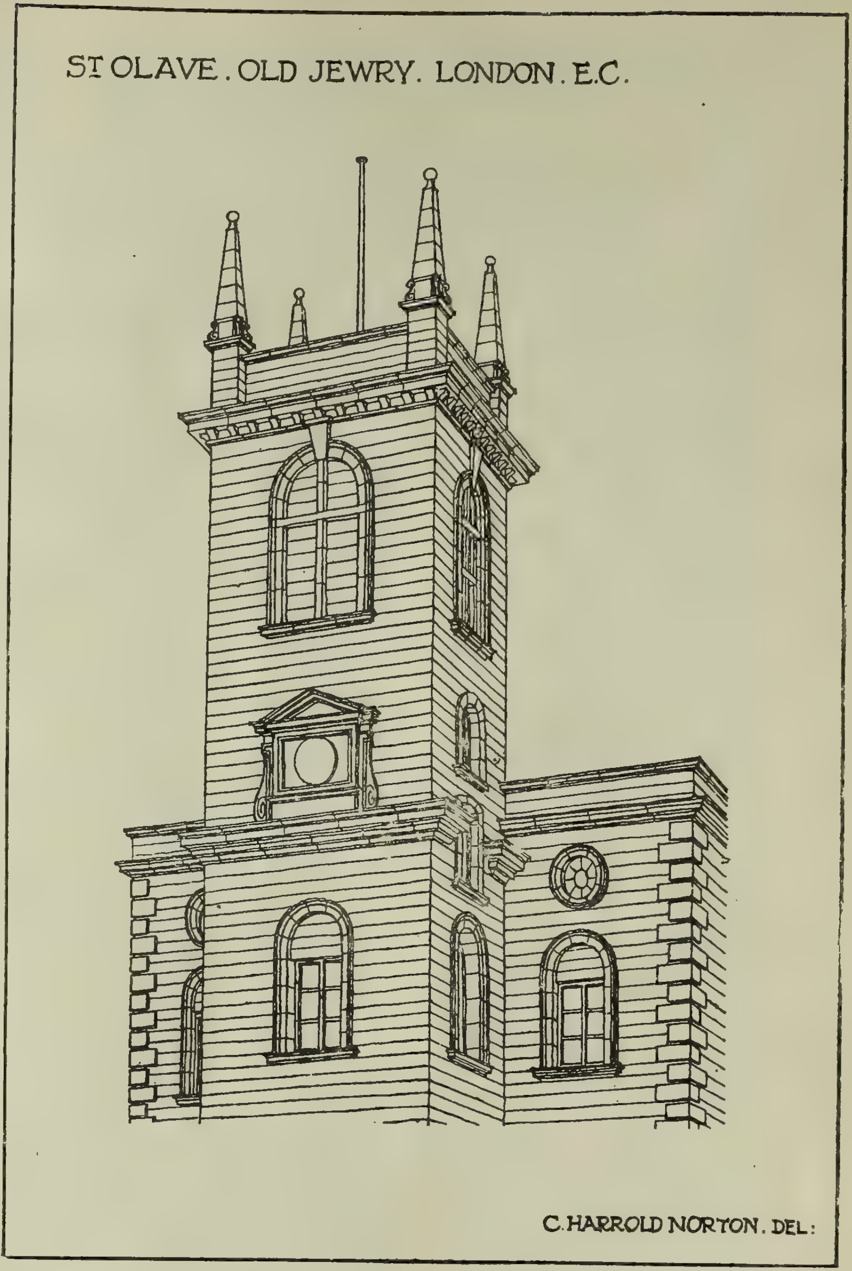
E LONDON CHURCHES DF WREN AND LATER RCHITECTS OF THE ENAISSANCE.

No. XXXIV.—St. Olave Jewry.

. OLAVE JEWRY was situated between Iron- ger-lane and Old Jewry, its east end ting on Old Jewry. It was built between -79 at a cost of £5,580. The church has pulled down and devoted to secular uses, the tower still remains as part of St. aret's Rectory, the parish being united that of St. Margaret, Lothbury. The of the demolished church, with those of ntholin, Watling-street, and St. Benetfink h are now demolished), are among the singular devised by Wren. But, though design of two former churches had a clear n *d'être*, which was the use of the ellipse *motif*, the reason which impelled Wren dopt the curious coffin-shaped outline of lave is more obscure. In all probability uld seem that the two long tapering sides those of the boundary of the site or of old upon it, and the shorter cants which the outline of a coffin were meant to correct unpleasant appearance which would have otherwise given by the acute angles ed by the northern and southern walls at junction with the west front.

this as it may, a comparison of Wren's hes with those of his successors shows that occupied an intermediate position between mediæval builders who were indifferent gularity and the classic schools which have prone to give it undue importance.

e churches of Wren, excluding that of James, Piccadilly, but including those demolished, cost £263,786 10s. 4½d., as own in some contemporary records which fortunately discovered by Mr. Lawrence ver and communicated to the Society of uaries* in the form of a paper. The ls given, which include the names of hief tradesmen employed, also prove that wonderful series of buildings was entirely work of native craftsmen, thus possessing im on us which is absent from the work ose later architects who were in many partially dependent on imported talent.



ST OLAVE . OLD JEWRY . LONDON . E.C.

C. HARROLD NORTON . DEL:

HAKESPEARE'S LONDON."

SIDNEY LEE presided at a meeting of the on Society held at the Society of Arts, phi, on May 11, when Mr. T. Fairman h gave a lantern lecture on "Shakespeare's on."

e Chairman said he understood that the on Society had for its aim the improve- and the development of their great city, hief city of the Empire, on lines which respect the best principles of architecture the best aims of civilisation. Well, the principles of architecture and the best aims vilisation were synonymous terms. No t better deserved the support of London ns and of the municipal authorities, who not always inspired by artistic ambitions, t was in keeping with the beneficent aims e Society that in seeking provision for the e it should seek inspiration also from the The architectural reconstruction of on was not, he imagined, the desire of ne of ordinary sagacity. The prudent mer knew the value of historic continuity the wisdom of respecting tradition which ed respect, and architectural reform would a larger measure of approval the more it showed itself to national memorials or e memories of the great men who had d the nation to its fame. Shakespeare almost universally looked upon as the est of Englishmen, and for the London ty to keep alive memories of Shakespeare in accord with the enlightened purposes e Society. To acquaint themselves with aspect of Shakespeare's London was to home very graphically the full significance of many passages of his plays which might otherwise be obscure.

Mr. Ordish said the main outline of his subject appeared in the three riverside views exhibited on the walls. The first was the drawing by Antony Van der Wyngaerde, which represented Tudor London and showed some of the changes which ensued upon the Reformation. The second was the view of Visscher, dated 1616, which was a picture of Jacobean London. The third view was that of Hollar, dated 1647. This showed London when the Elizabethan tradition and the theatres were on the point of being effaced. It was the London which disappeared in the Great Fire. The great monastery of the Carthusian monks, called the Charterhouse, and the open space of Smithfield were well shown in the Wyngaerde drawing. On August 6, 1564, Queen Elizabeth came from Hampton Court on a visit to Howard House, as the Charterhouse was called, when Sir Edward North parted with the property to Thomas Howard, Duke of Norfolk. The Duke added the screen to the great hall. Sir Sidney Lee placed the coming of Shakespeare to London in the early summer of 1586. An engraving of Hoefnagel, which bore the arms of Queen Elizabeth, and therefore must be later than 1558, showed St. Paul's with its beautiful spire, which was destroyed by lightning in 1561. The engraving showed London about midway on its course of transformation. Those who walked the streets of the London depicted saw on every hand the ruins of the ancient order as the background of new conditions. Here were palaces where formerly stood monastic buildings. London was losing its character of a garden city. The open spaces and gardens of the dissolved religious establishments were being rapidly filled up with buildings. The lecturer proceeded to exhibit a large number of slides of the map of Ralph Agas, as reproduced by the London Topographical Society. It bore the arms of James I., but contained undoubted evidence of being an Elizabethan document. The map showed St. Giles-in-the-Fields, and the "Waye to Uxbridge," by which Shakespeare came to London. As he came along Holborn he passed the residence of Lord Southampton, the patron to whom he dedicated the first heir of his invention a few years later; the houses of the Staple Inn frontage, which still existed much as he saw them; and Ely Place, where he afterwards laid the scene of the death of John o' Gaunt in the play of "Richard II." If he came on foot he entered the City by Newgate. Smithfield and the church of St. Bartholomew the Great were well shown, and so was the line of the wall. The bastion shown at the angle below St. Giles', Cripplegate, was perhaps the one of which the remains were visible to-day. Mr. Ordish pointed out amongst other places the house of Mountjoy at the corner of Monkswell and Silver streets where Shakespeare sojourned later; Aldermanbury and the church of St.

The Complete Building Accounts of the City hes (Parochial) Designed by Sir Christopher " By Lawrence Weaver, F.S.A. 1915.

Mary the Virgin, the Guildhall and Mercers' Hall; the Royal Exchange, clearly added since the original engraving of the plate; the Eleanor Cross which stood in Cheapside; the Mermaid Tavern, standing between Friday-street and Bread-street; and Bishopsgate, with Shoreditch Church in the distance. Within the Bishopsgate was the precinct of the dissolved Priory of the Nuns of St. Helen's, and Shakespeare was living as a denizen of the precinct in 1596. Westminster and Whitehall were next dealt with. Westminster Hall happily existed to-day, and here Shakespeare laid the scene of the deposition of "Richard II." The lecturer showed a number of slides depicting the scenes on the Thames, which was the great highway of London in those days, and quoted passages from the plays of Shakespeare which must have been inspired by the things he witnessed. London Bridge, the Tower, and Eastcheap, where stood the Boar's Head, were described, as were the amphitheatres on Bankside for bull-baiting and bear-baiting. One slide was that of the yard of the Bull and Mouth Inn, which showed the galleries as they existed in Elizabethan times. If they added a platform stage, such as was set up in inn yards, they had the playhouse in its main features such as was first established by Burbage in Shoreditch in 1576. Engravings by Hollar of Durham House, where Raleigh resided, and of Arundel House and Salisbury House were exhibited. The Norden map of London, published in 1593, contained the earliest known representation of a playhouse—The Rose—where some of Shakespeare's earliest dramatic works were produced. In the winter of 1598-9 the Burbages removed their theatre from Shoreditch, set it up at Bankside, and named it the "Globe." Speed's atlas, published in 1611, contained the picture of London by Hondius, showing the "Globe," in which the most vital of Shakespeare's plays were produced between 1599 and 1613. Another view of London showed all the Bankside theatres as they existed together. One of the last slides shown was a view of Winchester House, with the park and Bankside behind. Mr. Ordish contrasted the condition of this district as it was in Shakespeare's day with its present sordid aspect, and strongly endorsed the suggestion of a writer in the "Pall Mall Magazine" that the proposed new St. Paul's Bridge, which will cut right across Bankside, might well be "Shakespeare's Bridge." If monumental sculpture might form part of the memorial it might be adorned with statue groups suggested by the plays.

The Chairman, in proposing a vote of thanks to the lecturer, said there arose a feeling of regret that so many of the beautiful buildings shown existed no longer. He felt it a most desirable thing that when new buildings took the place of old ones some tablet should be placed on the new building to remind them of the associations of the old. They must congratulate the London County Council on carrying out that very desirable work, and as students of history and literature they would be still more indebted to the Council if they could place some little representation of what had passed away. Something of the kind had been done at Southwark. That district was now a wilderness of warehouses, and there was very little which could be said to be interesting or architectural. The site of the "Globe" was now largely occupied by Messrs. Barclay, Perkins, & Co.'s brewery, but it was a very good idea to place on the outside wall of one of the buildings a pictorial representation in relief of the old Globe Theatre and the buildings adjoining. A few of the old buildings remained, and these they ought to preserve at all hazards.

Mr. W. J. H. Leverton, in proposing a vote of thanks to Sir Sidney Lee for presiding, said that in comparing Shakespeare's London with the Metropolis of the present day it was noticeable that, although we had a large number of fine buildings, the average of everyday architecture was much below that of the Shakespearean era. Something was "out of joint," and the London Society was founded to "set it right." Its aim was to raise the average, to banish mediocrity, and make all work together for the common good.

The votes of thanks having been heartily agreed to after further discussion, the proceedings terminated.

NATURAL CEMENTS.

There are probably many users of cementing materials who associate little that is definite with the expression natural cement, or who connect the designation solely with Roman cement, now a scarcely-used and largely discredited material. Since, however, some of our so-called limes are really natural cements, and, as this class of cement is imported and sometimes disguised to resemble Portland cement, a knowledge of the character of these bodies and their relations to the limes and to artificial cements is essential. Though admittedly little used in this country, these natural products are of great importance elsewhere, in America particularly, where they take the place almost entirely of our hydraulic limes.

The essential characteristic of a lime is that it "slakes," or, in other words, that it contains always a large quantity of free calcium oxide (lime) after burning; which, though it confers no strength, is necessary as a disrupting agent which breaks up the hydraulic constituents, and thus alone admits of their redistribution, causing "setting." In cements, whether natural or artificial, this excess of lime is absent, hence these materials do not break up after burning on the addition of water, but must be first finely ground. If, therefore, they possess a composition representing a high hydraulicity, and are burnt at a temperature best suited to develop this, cements as a class are necessarily stronger than limes, since the excess of free lime, which is useless as a final binding agent, is absent.

Natural cements, as the name indicates, are made from some material mined or quarried which, when burnt, yields a cement without the addition of other ingredients. All the stones used for this purpose belong to the limestone class, and indeed certain stones ordinarily burnt as limes can be burnt to form natural cements. The stones employed are, however, essentially siliceous and argillaceous (clayey) limestones, and generally contain sufficient iron to give a brown or, at least, yellow tint to the burnt product. The natural material, again, usually possesses an earthy smell, due to its clay content.

One of the chief sources of natural cements in this country used to be the clayey nodules known as septaria, collected chiefly on the east coast, and, though this industry has long since languished, the composition of these nodules may be given as illustrating the nature of these materials. Septaria from Harwich:—Silica, 21·9 per cent; alumina, 3·5 per cent.; iron oxide, 8·2 per cent.; lime, 32·4 per cent.; carbon dioxide, 28·4 per cent.; magnesia and alkalies, 3·8 per cent.; water, 1·8 per cent.

The burning of natural cement rock is effected in kilns much resembling those used for lime-burning, and the temperature attained varies, or should vary, considerably with the composition of the rock used. The resulting product consists partly of hard clinker, partly of friable material, and also of inert, unburnt matter; but it is a mistake to assume, as is generally done, that the clinker is always the best part of the "draw." If the percentage of silica is high the clinker, when ground, may be inferior to the friable constituent; but if low then it does form the most valuable part of the product. The grinding is effected in the most modern plants in tube mills, though edge-runners and other more primitive methods of attrition are still in use.

The now little-used Roman cement is usually regarded as the representative of this class in this country, but in reality several of the materials called hydraulic limes fall under this heading. Some of the so-called Lias limes, for example, are natural cements, and, though sold as limes, they have to be artificially ground by the makers after burning, and possess other characters now to be cited which distinctly place them in this category.

Natural cements are lighter, bulk for bulk, than Portland cement. The specific gravity—that is weight compared with an equal bulk of water—of Portland cement is about 3·1; but natural cements hardly ever rise to this figure, and their specific gravity may be as low as 2·7. They are further distinguishable by setting much more rapidly, which is due to their large content of alumina. Now, though the colo and rapid setting of natural cements mak them ordinarily easily recognisable witho recourse to a laboratory, adulteration—alwa easy in the case of a powdered material— unfortunately practised in the case particula of certain imported brands, and, further, certain cements produced from stones whi possess a composition resembling that of t ingredients used for Portland cement known as "Natural Portlands," an ea opportunity for fraud without much legal ri occurs when Portland cement is specifi without specific qualifications as regards source and qualities. The addition of grou cinders can disguise the colour, while sulpha of lime may be added to reduce the rate setting, both ingredients considerably decreasi the value of the cement, and, though the ent absence of sulphate of lime is not to be expecte inasmuch as the natural materials may legi mately contain a little of this compound, t amount necessarily added to slow down t setting of these highly aluminous cemen to compare with Portland is so great as to definitely injurious.

No standard specification for natural cemen is in general use in this country, but in Ameri where, as stated, these cements take the pla of our hydraulic limes, the requirement is oft made that a 1-in. briquette of neat cem shall withstand in tension 200 lb. after twent eight days, and a briquette, half cement a half sand, 150 lb. after the same interval. natural cements are poor sand-carriers, th strength decreasing very rapidly with increa proportions of inert matter, a fact which shou be remembered in comparing their cost w that of Portland cement.

CORRESPONDENCE.

The Prevention of Bribery.

Sir,—In reply to your "Note" on "The P vention of Bribery" I should like to point that the Bribery and Secret Commissio League, Incorporated, is within a few mont of being ten years old, and has a membersh of over 400 members, and affiliated to t League are a number of important trade bod with a very large aggregate of membersh Experience has shown that there is a consid able value in a large body being banded toget to suppress an evil. The League has be working after the fashion, but after a lo interval, of the Royal Society of Preventi of Cruelty to Animals and the National Soci for the Prevention of Cruelty to Childr Many persons have found the League a supp in their objection to give bribes, and ma I do not doubt, have found the fear of t League—and of the law—prevent them fr asking for or accepting bribes.

The Secretary,
Bribery and Secret Commission
Prevention League, Incorporated

FIFTY YEARS AGO.

Westminster.

With reference to an observation report in our last number, touching the railw works now going on in front of the Abb and the fear lest a station should be plac there, we are told by one who ought know that the station of the line now course of construction (that of t Metropolitan District Railway) is to be Canon-row. To this there can be objection, but it is to be hoped that it w not be allowed to obliterate the na "Canon-row," which, whether it be deriv from the channel of the Thames, that form the north-eastern boundary of Thorn Island, or from the canons of St. Stephen is one of the most interesting histori reminiscences of the neighbourhood.

BOOKS.

thic Ornaments. By A. PUGIN. (Published by Messrs. J. Tiranti & Co., 13, Maple-street, Tottenham Court-road. 12s. 6d.)

E have received a copy of an excellent reproction of Pugin's "Gothic Ornaments," comising over ninety plates, the illustrations being every respect equal to those in the original lume. There is little doubt that many idents and others will be glad to have a copy this well-known work, which is both a collecon of interesting mediæval ornament and a stimony to the untiring and devoted work of great Gothic enthusiast, whose name is emorable as a pioneer of the Gothic revival.

bert Adam and His Brothers: Their Lives, Work, and Influence on English Architecture, Decoration, and Furniture. By JOHN SWARBRICK. (London: B. T. Batsford, Ltd. £2 2s.)

E give two from among the many blocks iich supplement the whole-page collotype istrations in the interesting and useful work Mr. James Swarbrick. The chimneypiece own from Harewood House, Yorks, is a good ample of the adaptability of the style in rk of comparatively simple and inexpensive aracter. The beautiful medallion in the ntre of the plain panel over the chimneyece gives a decorative finish and completion the design at a minimum of actual expense, d it is in such features that the mastery of e brothers Adam can be best understood. their work the utmost architectural value is tained by the due relation and disposition very simple mouldings and well-ordered aces, effects which involved the use of aborate woodwork in Elizabethan and cobean work, and in later periods a more onumental note which was at once more stly to execute and called for a greater note elaboration in furniture and decorative cessories.

The second illustration given shows the alian gardens and orangery at Bowood, in iltshire, a very pleasing instance of careful esign, in which full architectural value is tained with a minimum use of architectural aboration. The Adam style suggests rest d refinement as thoroughly as the best aroque work is instinct with vigour, fancy, d richness, and therefore is more applicable the ordinary architectural problems of an e which is more utilitarian than that which w the birth of the richer and more sumptuous pressions of the Renaissance in art. Our lmiration for the genius of men whose work as founded on an intimate study of the gorgeous productions of Italy and France, and who yet could produce what was perfectly adapted to the sobriety and utilitarian wants of England of the Georges, must indeed be great, and a careful study of the work of the brothers Adam will prove of use both to the practising architect and the architectural student, for it is work which will live because it was perfectly adapted to the requirements of which it was the outcome and solution.

THE CRADOCK MEMORIAL IN YORK MINSTER.

The mural memorial to the late Rear-Admiral Sir Christopher Cradock, who perished with his ship, the *Good Hope*, in the battle which took place off the coast of Chile, is to be unveiled in York Minster on June 16. The memorial is the work of Mr. F. W. Pomeroy, A.R.A.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.
(May 8th.)
(Before Mr. POLLOCK.)

Heavy Claim by Builders:

Spencer Santo & Co., Ltd. *v.* The Commissioners of H.M. Works and Public Buildings.

THIS was an action in which the plaintiffs, a well-known firm of builders, claimed £97,109 as balance of charges under contract with H.M. Commissioners of Works for erecting the new Local Government Board offices at Whitehall. The hearing, which is being taken in the Railway and Canal Commissioners Court for convenience owing to the large number of documents and exhibits involved, is expected to occupy several weeks.

Mr. Holman Gregory, K.C., Mr. Compston, K.C., and Mr. Inman, instructed by Messrs. Turner & Co., appeared for the plaintiffs, and Sir Robert R. Acland, K.C., with Mr. Lowenthal and Mr. Giveen, instructed by the Treasury solicitors, were for the defendants.

Mr. Holman Gregory, K.C., in the course of a lengthy detailed opening for the plaintiffs, said that by a contract in writing, dated April 14, 1902, the plaintiffs undertook for a sum of £473,000 to build and complete certain public offices at Westminster, and they now claimed for balance of the price of work done and materials supplied in the erection of those buildings, which were situate at the corners of Parliament-street, Charles-street, and Great George-street, a work which extended over a period of five years. The plaintiffs entered into a contract to erect the buildings in accordance with eighty-two drawings which had been prepared by the architect, named Brydon, but, in fact, they were called upon to erect a building which was entirely different from the original drawings. Not one of the plans of the drawings was conformed to, with the exception of one which related to the fire hydrants. The building as erected was quite different from that provided for by the contract. The only thing that was the same was the outside elevation. In appearance it was the same building, but, in fact, it was quite a different building. After the contract was signed other plans were given to the builders to build to, which provided work to be done and was of an absolutely different character to that provided for by the contract. The building so far as the internal arrangements were concerned was not the same. The plaintiffs made their preparations to erect the building, but before they commenced changes were made, and from time to time further changes were made, until in the result the whole structural character of the building was altered. Frequently the plaintiffs were supplied with fresh drawings in place of the contract drawings, as well as with fresh instructions. The plaintiffs duly completed the building in accordance with the fresh drawings and instructions, but the changes and reductions in the different parts of the building made the materials and work, particularly the masonry, brickwork, and steelwork, far more expensive in proportion than they would have been in a building constructed according to the contract documents. Another story was added to the building, and by a process of what was called "skinning the work" the builders were told to put up this other story, and were told that they were entitled to £406,000 instead of the £473,000, although, in fact, they had expended upon the building much more than the contract sum, caused to a great extent by reason of the altered character of the building put up and not having received proper instructions. There was also a serious breach of contract in respect of the supply of Portland stone. It was provided by the contract that the plaintiffs were to obtain the Portland stone required for the work from the Bath Stone Firms, Ltd., with whom, as stated in the contract, the defendants had entered into a contract for the supply of the stone. In order that the stone supplied might be of proper quality, it was provided that the representative of the defendants should inspect the blocks and stone required previous to their being stacked for the plaintiffs' exclusive use in the work, and that the requisite quantity of stone to meet the plaintiffs' requirements would be at all times ready in the stacks, and that no delay should occur in the delivery of the stone when ordered. The defendants had failed to carry out these conditions, and a large portion of the stone was not of proper quality and was condemned after arriving at the work. As the defendants failed to take steps to enforce their contract with the Bath Stone Firms, there was seldom sufficient stone in the stacks to meet the plaintiffs' requirements, and there was great delay and irregularity in delivery, whereby damage was suffered. Further, it was alleged that the defendants wrongfully purported to exercise their power in the contract provided of omitting work for the purpose, not of omission, but in order to give such work or work substituted for it to other contractors, and extra work which ought to have been ordered of the plaintiffs was given to other contractors, for which the plaintiffs claimed a fair and reasonable price. The plaintiff company was a well-known building firm registered as a company in 1898. They had a large working capital, and up to the time of this contract were in an exceedingly flourishing condition. Unfortunately, in consequence of what had happened during the erection of these buildings, they were not in 1910 in such a successful position, and in 1911 an order was made to wind them up, and the present action was being brought under an order of the Court on behalf of the debenture-holders. The building erected by the plaintiffs, and in respect of which they were claiming, had a frontage of 600 ft. in Charles-street, 300 ft. in Parliament-street, and 250 ft. in Great George-street, and provision was made for lighting and ventilation of three large courts and ten smaller ones inside. Before November, 1901, Mr. Brydon, the architect, died, and Mr. Tanner, now Sir Henry Tanner, was appointed architect in his place. The plaintiffs further said that they were greatly delayed and the works were disorganised by the non-supply and delay in supply of instructions, drawings, and details, and by the failure of the defendants to order and their delay in ordering goods and work to be supplied, and by failure to select and supply materials for the work, and by supplying materials of an inferior character. Under the plans and drawings it was contemplated that in the proposed building there should be six floors, three below the ground level and three above, and that the main part of the building should be of brick and that all joists and other details of that kind should be of steel. The defendants covenanted that the architect could from time to time certify the sums to which the plaintiffs were entitled under the contract; but he never did so certify, and the sum paid to the plaintiffs was far short of the sum to which they were entitled.

In the course of his speech, which occupied three days, counsel incidentally mentioned, in relation to the plaintiffs' complaint of alterations, that during the progress of the work there were no less than 436 separate and distinct variations in the plans and drawings, and in many instances they were variations upon variations.

The hearing had not concluded when we went to press.

Dangers of Surveying.

AT the Brentford County Court his Honour Judge Scully recently concluded the hearing of an important case in which Francis Daniel Brill, surveyor, of Waldemar-avenue, Ealing, sued Thos. Hy. Bolam, dentist, of Broughton-road, Ealing, for £31 10s. damages for personal injury.

Mr. Dunbar was for the plaintiff, and Mr. W. M. Duckworth for the defendant.

According to the former, the defendant instructed plaintiff to visit his premises, 39A, George-street, Richmond, to inspect the top floors, tenanted by a housekeeper. Plaintiff duly attended, and saw a leakage through the roof. To see the outside of the roof he proceeded to open a dormer window. The sash lines were broken, and directly he pushed back the catch the top frame fell, jamming his fingers in such a way that to get them free the sash had to be prized up. Two fingers were very lacerated, and he was kept from following his employment for three weeks. His earnings prior to the war he put at £10 a week, but they had fallen to £8 8s. He claimed three weeks at this sum and special damages for pain and suffering.

Plaintiff gave evidence supporting the opening, adding that the sash cords must, from a subsequent inspection, have been broken for months. He himself surveyed the place before defendant took it nine months before. The proper way to get at the roof was by a ladder, but he chose the window because he could see all he wanted from it.

The defendant, in his evidence, said that he had no idea that the sash lines were broken. He was not daily at the premises, which were in charge of an operator and housekeeper. Neither had disclosed to him the defective window.

Mr. Duckworth argued that there was no hidden trap, and the case did not come within any one yet settled. The nearest approach to it was a Scotch case, in which the wo governing the judgment were "knew or ou to know." Here the defendant did not kn and no person about the house told him. T premises were done up nine months before, a defendant had never been in the rooms at all.

His Honour: But ought he not to know, a on whom lies the duty of knowing? If invite a friend to dinner, am I under a duty not to him to investigate the due safety the stairs or the chairs?

Mr. Duckworth thought not. That would going too far. But if a builder had gone this roof and fell through, the defendant wo have been told he ought to have had surveyed previously to satisfy himself of security or otherwise. If it were held he ou to know, he would have to prowl round house every day to look for dangerous defe That was a *reductio ad absurdum*.

His Honour: But someone ought to kn and on whom is that duty?

Mr. Duckworth: Much depends on person invited on to the premises. Here plaintiff is a person who, by professional tra ing with surveying dilapidations, should h suspected danger.

Mr. Dunbar contended that plaintiff, find the rooms furnished and occupied, would justified in imagining that the window in daily or frequent use, and therefore safe.

His Honour: What could the defendant h done to warn the plaintiff?

Mr. Dunbar: He could have warned through the housekeeper as his agent.

His Honour: What is the owner of a ho to do with regard to discovering defects bef he invites a man to enter?

Mr. Dunbar: It is referred to by implicat in many cases. There was implication here t the housekeeper suspected something was wro with the window, as she never opened it.

His Honour: It is her duty to the defend to tell him. She has no duty to the plaintiff

Mr. Dunbar: But defendant when he let rooms to the housekeeper should have seen windows were safe.

His Honour: That is his duty to her.

Mr. Dunbar finally submitted that a n ought to know of the defects in his house.

His Honour, in giving judgment, said action was founded on the principle expound in the well-known case of Indermaud *v.* Dam regarding the duty of an occupier towa persons who, by invitation, express or impli came into the occupier's premises for the p pose of his business. That principle would apply to persons who were guests, but h plaintiff, a surveyor, was engaged professiona by defendant to visit his premises. It was duty of the occupier, the case laid down, take reasonable care to prevent damage to invitee for any danger by removing the dang and giving warning. In Norman *v.* the Gr Western Railway it was required that a plain must prove that there was some danger wh was for him unusual and unexpected. T questions that arose were: Ought plaintiff have known or suspected the danger, or oug the defendant to have told him about danger? It was stated in the *Mowcock* case, the Admiralty Courts, that the owner of wharf was liable to notify to a shipmaster the condition of the bed of the dock, and, in much as the tides affected the bed, there no doubt of the soundness of the decision. this case a window was involved, and it not something affected by tides or weathe The occupier might not know of the defect, he might know it and not appreciate that was a danger to the invitee, although in latter instance it was his duty to give a wa ing. Then there was the point: Was occupier bound to make careful examination the premises to see if there were defects a dangers, and must he be deemed to know danger, hidden or otherwise? It was reasonable that he should search for defe and dangers, and, moreover, the ordina householder would not possess the necessa technical knowledge to find out and det defects and, maybe, sources of danger. T settled cases gave little help in deciding extent of an occupier's liability to find defects, but neither reason nor author suggested to him that it was the duty of inviter—the occupier—to inspect the premi or find out defects. In this case the eviden showed clearly the defendant did not know the danger, nor did his housekeeper. Bo knew the window cords had not been attend to for very many months, but was th sufficient to warrant them suspecting dang He thought not, particularly as it was no pa of the definite instructions to use the wind for looking on to the roof. He found for defendant, with costs. Notice of appeal given.

NERAL NEWS.

"The British Architect."

ll be of interest to our readers to know ır contemporary *The British Architect*, rty-three years of continuous publication, ısed to appear weekly, and that it will duced as a monthly magazine in an d and improved form. The first issue contemporary as a monthly will appear eek.

sh Mural Monuments and Tombstones Seventeenth and Eighteenth Centuries."

is the title of a book which Messrs. d will publish this month. The volume ntain numerous reproductions of photo- to a large scale, specially taken under ection of Mr. Herbert Batsford in various f the country, with the intention that ould be representative of the best work period, and form a source of inspiration present time. Mr. Walter H. Godfrey, ct, F.S.A., has written an introduction tes to the photographs.

The Committee on War Damage.

eeting of the Executive Committee was cently in the Hall of the Brewers' Com- London. The following resolution was :—" That the Committee reaffirm their ination not to ask the Prime Minister ive their deputation until they are in a n to prove beyond fear of contradiction hey have the support of the country prayer of the memorial, viz., that the ment abandon their scheme of War e Insurance, return the premiums paid; and provide out of national for compensation to those who suffer e from the attacks of the enemy. r, that efforts be made by means of the meetings to obtain the requisite support the next payments of premiums become iz., July 19 next." At the close of the Guildhall meeting the number of pal authorities who had resolved to join presentation of the memorial was 394. as now increased to 430.

sh Furniture at the Victoria and Albert Museum.

Frank Green, of Treasurer's House, York, ently presented to the Victoria and Albert m a number of important pieces of h furniture, together with several other s of considerable artistic interest. The ıre belongs for the most part to the of the later Stuarts and William and and includes several types hitherto esented in the Museum collections. g them may be specially noted a pair of t chairs of about 1700, covered with idery in silk and wool representing vases ips, carnations, and other flowers, and tools similarly covered; also a single covered in finer embroidery with floral s. Another chair, with a tall back l in openwork and a seat covered with idery, belonging to the period of William ary, is illustrated in Macquoid's " History nglish Furniture." Several interesting are included in the gift. Of these the st may be attributed to the later years seventeenth century. It has legs carved n spirals, and a top decorated in marquetry tted with a panel enclosing a backgammon . This table also is illustrated in ıoid's History. Another table of about ame period as the above is of gilt wood gilt *gesso* top finely ornamented in French such as characterises the period of XIV. A third specimen, a side-table, t wood, in the style of William Kent, is a al example of the massive furniture which ed the great houses of England during eign of George II. These pieces are ited in Rooms 55 and 56 of the Woodwork ies. Other objects are included in the Mr. Green has also lent to the Museum a four valuable chairs of the time of Queen covered with Mortlake tapestry woven ol and silk with designs of flowers.

Sale of Old Furniture.

It is stated that carved Georgian chimney-pieces realised £50 and £39 at the sale of Sir M. FitzGerald's furniture at Severals House, Newmarket, by Messrs. Knight, Frank, & Rutley. A Sheraton writing-table was sold for 15 guineas, a small French commode for 60 guineas, and twelve chairs in the Chippendale style for 25 guineas.

London and Lancashire Fire Insurance Company, Ltd.

The annual Report of the London and Lancashire Fire Insurance Company, Ltd., shows that the net realised profit in the Fire Department was £166,090, in the Accident Department £64,698, and in the Marine Department £44,450—an aggregate of £275,238. The sum of £241,886 is placed to reserve, which has now reached the total of £3,708,229. The total security to policy-holders now amounts to no less than £6,349,479.

Gretna Disaster Memorial.

The Earl of Rosebery, hon. colonel of the regiment, recently unveiled a memorial erected in Leith in honour of the officers, non-commissioned officers, and men of the Leith Battalion, the 7th Royal Scots, who lost their lives in the railway disaster at Gretna a year ago. Nearly £4,000 was subscribed for the memorial, which takes the form of a Celtic cross in grey granite, with mural tablets bearing the names of the fallen.

The Builders' Accident Insurance, Ltd.

At the thirty-fifth ordinary general meeting of this company, held at the Registered Offices on Wednesday, 3rd inst., the directors submitted their annual Report and statement of accounts for the year ending December 31, 1915, from which we take the following:—The premium income during the year has been well maintained, but a falling-off may reasonably be expected when the effect of the war on ordinary building operations has declared itself. The valuation of the investments as at December 31, 1915, shows a depreciation of £1,122 18s. 11d. The funds of the Association, after allowing for the above depreciation, stand at £29,146 11s. 11d., as against £24,884 13s. 3d. at December 31, 1914. In accordance with the articles of association, the following directors retire, and, being eligible, were re-elected:—Messrs. Thomas F. Rider, Woodman Hill, and William Nicholson.

An Empire Memorial.

At the annual meeting of the Royal Colonial Institute a letter was read from the President, Earl Grey, in which he stated that one of his ambitions was that the Institute might one day be housed in a building worthy of the Overseas Empire, of which it was becoming every year more and more representative. Lord Grey added:—" It is a humiliating fact that, notwithstanding that London is the centre of the greatest empire that has ever existed, there is not one conspicuous building which suggests that the Empire consists of anything outside the United Kingdom. After the war is concluded the public opinion of the Empire will require that a memorial in honour of those Britons who have offered their lives in order that the world may retain its liberties shall be erected in the heart of London; and I would respectfully suggest to the members of the Institute that they should use their influence in favour of the proposal that the suggested War Memorial should take the shape of a building and an organisation which shall stimulate a closer inter-Imperial trade, and a more intimate mutual knowledge, sympathy, and affection between the component parts of the Empire. Fortunately, through the liberality of Imperialists in Canada, Australia, New Zealand, and South Africa, as well as in the United Kingdom, the finest undeveloped site in London, namely, that between Kingsway and the Strand, has so far been safeguarded against appropriation by the private builder, and has been kept available for high Imperial purposes. It is my hope that on this site may arise a building in which the Royal Colonial Institute may find more dignified and appropriate habitation than in its present extended but still too limited quarters."

The Royal Scottish Academy.

The nineteenth exhibition of the Royal Scottish Academy is now open in Edinburgh.

The Society of Antiquaries.

At the anniversary meeting of the Society of Antiquaries of London Sir A. J. Evans, F.R.S., was elected President, Mr. W. Minet, Treasurer, Sir E. W. Bradbrook, Director, and Mr. C. R. Peers, Secretary.

Zeppelins and Stained Glass.

An appeal to custodians of buildings containing ancient glass that they should protect it by boarding, or remove it during the time that there may be danger from air raids, is made by Mr. Thackeray Turner, Chairman of the Committee of the Society for the Protection of Ancient Buildings. Mr. Turner is of opinion that the most reasonable thing to do is to have a frame made, about the size of the window, and cover it with ¾-in. rough boarding, giving as much space between the boarding and the glass as possible, in order to allow for concussion

Carved Panel, St. Stephen, Coleman-Street.

Referring to the note on the carved panel, St. Stephen, Coleman-street, E.C., in our last issue, the facts stated are not, we are informed, quite accurate. The panel over the gateway at the church is a replica of the original. The original, however, is not in the Guildhall Museum, as stated, but is kept in the vestry of the church. The reason for its removal was that it showed signs of decay, and it was moved inside and placed under glass for its preservation. This was carried out, and the replica put up over the gateway, the churchwarden then in office generously doing this at his own cost and charges.

Exeter Archæological Society.

At the annual meeting of the Exeter Diocesan Architectural and Archæological Society the annual Report was read. Speaking of the efforts of the Society in regard to the King-street Houst, Exeter, the Report stated that its preservation was ultimately accomplished by the action of the Office of Works, although the Society contributed to that success. They could have nothing but praise for the admirable public spirit shown by the City Council in its treatment of the Priory of St. Nicholas. During the past year further discoveries had been made, including, with some of the actual foundations, it was believed, the site and extent of the Priory Chapel.

The Marseilles-Rhone Canal.

Discussing the Marseilles-Rhone Canal, a Press Association message describes the Rove Tunnel as a triumph of engineering. It is not so much the length of the tunnel, the message states, though it is 4½ miles long, that most impresses the imagination; it is its breadth and its height. It is 72 ft. broad—that is over 26 ft. broader than the Paris Underground—and from the Canal bottom to the summit of the vault its height is 46 ft. There will be 10 ft. of water in the Canal, so from its surface there will be a clear space overhead of 36 ft. It will take three years before the Canal is ready for traffic, but when the work is done Marseilles will join hands with Havre for the first time. The estimated cost of the Canal is £3,600,000.

Mr. F. Bennett, J.P.

The death is announced of Mr. Frederick Bennett, building contractor, formerly of New-street Works, Ipswich. Mr. Bennett was a native of the borough; he was born on April 19, 1846. His father was the proprietor of a building business in St. Clement's, and at the age of seventeen he was drafted into his father's business. Later he became associated with his brother, the late Mr. J. B. Bennett, in the direction of the concern, and many large contracts were carried out. One was the erection of the Ipswich Museum and Free Library, and various adjuncts; others included the Naval Barracks at Shotley, the Waterside Works, shops forming part of the Orwell Works, buildings for the late Duke of Hamilton at Easton, near Wickham Market, and for the late Sir Cuthbert Quilter at Bawdsey Manor. The total number of houses and other buildings erected by the firm approximates to nearly 700.

ILLUSTRATIONS.

Khartoum Cathedral.

THIS church has been designed by Mr. Robert Weir Schultz Weir, whose special knowledge and study of the Byzantine buildings of the nearer East qualified him for undertaking the task. It has already been illustrated in this journal, perspective views of the exterior and interior having been published in our issues for September 11, 1909, and February 2, 1912. The opportunity has now been afforded us of publishing the working drawings and also photographs of the existing building, which we hope may prove of interest to our readers. The architect has supplied us with a description of the building, and this appears on page 371.

THE WONDER OF WORK.

Now that the mild excitement occasioned by the expectations of the Architectural Room at the Academy has had a few days in which to evaporate, we may return to the challenge of Mr. Joseph Pennell. We need not repeat our apologies for the lack of any striking effort of imagination there which might have formed an effective reply to him. The reaction is to come, and spiritual expression will have its vent, naturally, in a spiritual period when that recurs.

Yet, in spite of the brutality of Mr. Pennell's onslaught in his article, "My Views of the Wonder of Work," which we are glad to have seen printed, and which we welcomed, we cannot but be grateful to him for steeling our nerves and forcing us to some self-examination. He is in the habit of hitting hard, and this time, though the conventions he assails are deeply entrenched, he gets home in places. In countering such an assault we are forced to the same methods. If the hatchet is to be buried it must be "in the enemy's breast," to quote the master of whom Mr. Pennell is an avowed disciple.

Many of us have followed Mr. Pennell's art from its earliest development. We have observed his restless interest in one phase after another of architectural copy for his journalistic purposes—travelling over the old mediæval centres of Europe, culling the tit-bits of picturesque ruins in the days of the best American magazines and their travel stories. Later, we found him intrigued by the *papier mâché* dreams of the great exhibitions with their romantic groupings and waterways, the colossal structures of New York with their splendid adaptations of European motives to the requirements of the modern concentration of the human machine. Like the great Piranesi, he has arrived at a stage when he finds apparently nothing to record in the world of grace and seeks to find another Carceri series in the mammoth engines of modern engineering and material production, even including the forces of destructive war and German frightfulness. All these latter subjects are legitimate and excellent matter for representation, and are possible, given the artistic veil with which they are screened by a merciful atmosphere, of being transformed into castles of romance and the illusion of mirage. But while we owe thanks to the Whistlers and Pennells of this time for assisting us in the tolerance of enormities, and even helping us to be thankful that we are allowed an existence in the Brobdingnagia of toil, we cannot accept the verdict of the impressionable pictorial artist that the art of architecture as we architects understand it has gone with the past, and that it is left to the engineer to carry on its traditions and its appeal, consciously or unconsciously.

After all, the life of the individual man and woman goes on in much the same proportion as it did hundreds of years ago. One eats and drinks the same quantity, one endures not much more or less, and the spirit that is in us responds to the delicacies of eternal influences.

As communities have always unconsciously formed themselves as a refuge from the terror of the plain, the sea, and the elements, so shall we shrink from the colossal ugliness of modern enterprise, necessities though they may be, the awful uniformity of the great army and the system which necessitates it.

The crash of the orchestra is only tolerable in the balance of the composition.

The mistake Mr. Pennell makes is that architecture does not exist, in the first place, to be exploited by the modern pictorial artist. Those of his craft who roam the world for subjects for their periodical exhibitions are searching continually for the sensational, and by virtue of their public appeal are too apt to constitute themselves arbiters of tastes and critics of the far more subtle art of creation. It is the old question of the executive and creative artist, the virtuoso and the humble composer. The modern etcher, lithographer, and many of the painters, such as Brangwyn, in their exploitation of the building as subject-matter, are, by way of obscuring our vision, vulgarising our taste, and in their flights of imagination drawing us farther from our relation with contemporary life than we ever were in the worst stylistic and revivalist periods. They can have no conception of the processes by which a modern building, of any sort of purpose, is conceived and evolved, of its intimate relation to the scale of the life which it is to shelter, and the material available to the artist entrusted with its execution. The true artist in architecture can express himself with all these limitations, and the last person he will endeavour to appeal to will be the picture-maker in search of melodrama rather than the true poetry of this modern life, such as it is.

Perhaps the real answer to Mr. Pennell is that the average man is less than 6 ft. in height, whether he be English, American, French, or even German; and, in spite of the acceleration of our present life, he is more than half his time in a state of comparative repose. Certainly the amenities of this life, including architecture, its form and disposition and even its accessories, must be governed by this unalterable fact. We may surrender to the suggestion contained within the lines of a frame or proscenium arch, but we cannot emulate them in the scale of life in which we, as architects, have to labour. It is tru the entrance to a great building is the thr of a world with its own atmosphere, whe suggestion of the infinite may be felt, an the human scale be for the moment obs but Mr. Pennell has not touched or perhaps the more important of the arch opportunities. The design of the inte where no engineer can ever follow, h terrifying and forceful he may prove efforts to eclipse the mountains, dam the and outdo Nature herself. The architec is the master with all the resources engineer at his disposal, a subservient to the cunning of the artist mind.

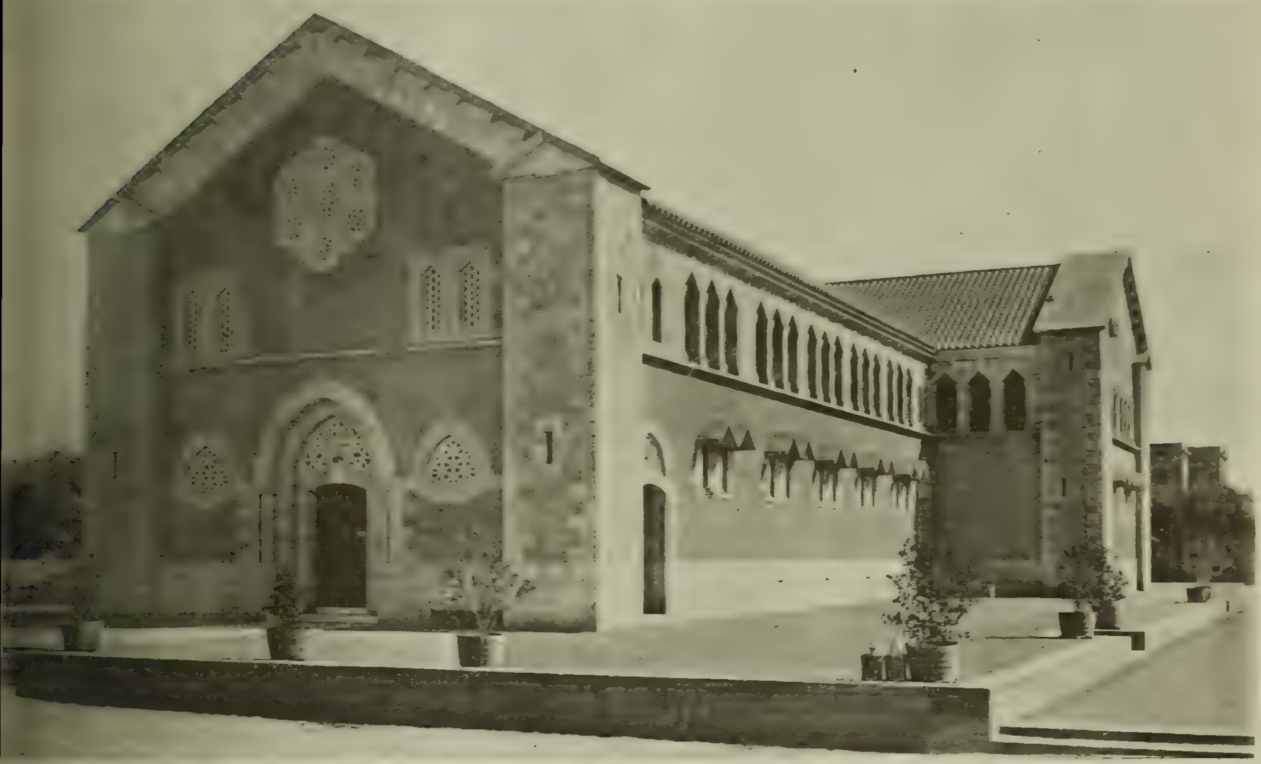
HE CATHEDRAL OF ALL SAINTS, KHARTOUM, SUDAN.



Khartoum Cathedral: View from the West.

Mr. Robert W. S. Weir, Architect.

R some years after the reconquest of the Sudan, Church of England services were held in a large room which had apart in the palace at Khartoum for the ne Anglican community.

vas obviously only a temporary arrange- nd steps were taken to collect funds erection of a permanent church. The ion-stone was laid by H.R.H. Princess (Princess Henry of Battenberg) a visit to Khartoum, but it was some able time after this before a real start was th the erection of the structure itself.

the plans had been prepared and d many difficulties had still to be ne, not the least of which was the ng of an efficient building staff. There y little skilled labour available, and there was no real building tradition in the country. Good building stone existed in one of the isolated hills which stand up in the otherwise flat country; but the quarrying of this stone had hitherto been done in a very primitive manner. This hill, called Gebel Auli, is situated close to the banks of the White Nile, about twenty miles above Khartoum, and the stone was brought down to the city in small quantities and sizes by the native river boats.

It was essential for the proper carrying out of the work to secure the services of a fully-trained mason, who also had some experience in quarrying as well as in the organisation and direction of practical stone-dressing and building of good character. The Committee was fortunate in securing the services of Mr. John Latimer, a Scottish mason of considerable experience in both, who went out to Khartoum and undertook the complete charge of the works, both quarrying and building.

His task was an uphill one at the beginning, as not only had he to initiate proper quarrying methods, but he had also to train such craftsmen as were available, principally Italian and Greek masons who had found their way to the Sudan.

The unskilled labour was almost entirely undertaken by natives, both male and female, the women acting as bearers, carrying the soil out of the trenches on their heads in small baskets, and, later on, bringing up the mortar and the bricks for the vaulting as well as other materials to the men who were doing the building.

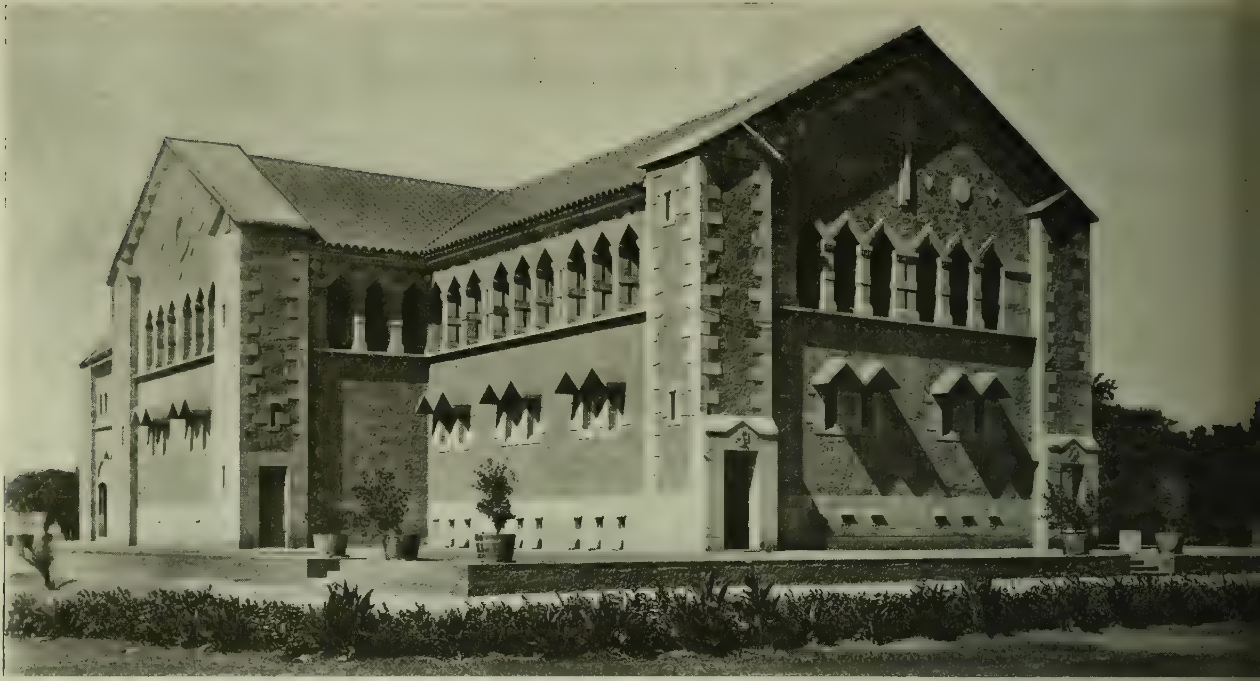
As timber was scarce and expensive, it had to be used sparingly; elaborate scaffolding and centering were therefore out of the question. No cranes were available, and all the material had to be carried up long sloping gangways to the various levels. One "centre" was used for all the main arches, which were built one at a time.

Work carried on under such conditions would necessarily be slow, and it took a number of years therefore to construct a building which in this country could have been carried out in eighteen months or two years. This was rather an advantage for many reasons—the supply of labour was limited, the money came in slowly, and the building went up very gradually and did not overtax the foundations by bringing an undue pressure of heavy weight all at once on a very precarious subsoil.

The nature of this subsoil was unusual. It consisted of sand, dry for some months, while the Nile water level was low, but impregnated with water which found its way in when the rivers were in flood.

The heavy cost both in material and labour rendered such a scheme as the construction of a large concrete raft over the whole area of the site impracticable; and recourse was had to a rim of concrete all round under the walls, and these were so constructed (see sections) as to

The Vault before the Outer Covering was put on.



Khartoum Cathedral : View from the East.

Mr. Robert W. S. Weir, Architect.

spread the weight equally all along this rim. The adoption of this scheme has been justified in the result, as the structure is absolutely sound, no cracks having developed anywhere. As a precaution, however, iron tie-rods were inserted just above the springing of the main arches, but these can and will be removed in due course.

The sandstone used in the building is of two colours, yellow and a pale red, and these have been used in contrast in the main arches and elsewhere with very good effect.

The limitations of the so-called skilled labour influenced the design of the building considerably. For instance, the window-heads were made of two stones sloping to an apex, as being simpler to fit and build than small arches ; plain splays and simple cuttings were adopted generally, and mouldings were almost entirely eschewed. The superstructure was started at the east end and gradually worked westwards, and by the time the west end was reached sufficient experience had been gained to warrant the introduction of some slight elaboration of the details in parts.

The nature of the climate also considerably influenced the design. The tropical sunlight had to be kept as far as possible from striking on the windows directly. This result was effected as regards the lower windows by using widely-projecting stone hoods, and the upper windows have been set back behind an external gallery, which also acts as a simple means of getting direct access to these windows for the purposes of opening and shutting, cleaning, etc. Here also can be hung on the inner face of the outer gallery openings mats or blinds, which can be kept wetted in order to cool the air before it passes into the interior of the church.

Being situated in the tropics, the building gets the sun on either side at one time or another of the year, so that precaution had to be taken all round. As sandstorms also come up, at one season from the north and at another from the south, entrances had to be arranged on both north and south sides for general use, so that easy access can be got at all times with the minimum of risk of the sand blowing in.

The west doorway is used when the climatic conditions allow, as in the cooler weather and also on occasions of State or special ceremonial. Similar conditions necessitated the raising of the building on a terrace and the placing of the main floor level about 4 ft. above this.

The roof also had to be constructed for coolness, with a sealed air-space the inner vaults and the outer coverin latter was formed of reinforced concre made as thin as practicable so as to kee the weight to a minimum. On these "Roman" tiles which form the outer were laid in such a way as to give a fur space between them and the slabs.

A projecting wall-head course w essential, with the tiles laid projecting same sufficiently far to throw the w clear of the walls—as in the Sudan, as from Egypt, heavy rainfall at a certain of the year has to be taken into consid

With the exception of the vaulting, th structure is entirely constructed of The vaults are formed of rough local and were built without centering, a traditional manner of Byzantine build

It was found possible to introduce amount of simple pattern piercing and as in the pierced stone slabs of the of the west façade, and over the three doorways, and in the capitals of the a stonemason having been found on capable of executing these from careful d and models. He also cut the de

Marylebone, was responsible for the construction of the steel casements and for the glazing of same. Messrs. Ames & Hunter, of London, supplied the roofing tiles, which were made in Essex.

Stained glass has been inserted in the seven small windows of the east wall. This was designed and executed by Miss Mabel Esplin, of Hampstead. A complete ikonographic scheme has been arranged by the architect for the windows in the north and south transepts, and several have already been carried out by the same artist. The other windows in the church will remain glazed with the cool green glass already mentioned.

The building is now practically finished, with the exception of the tower. The plans and details for this are complete, and its construction would have been started before now but for the war. It is to be hoped that, later on, funds may be available for erecting this and so entirely completing the design.

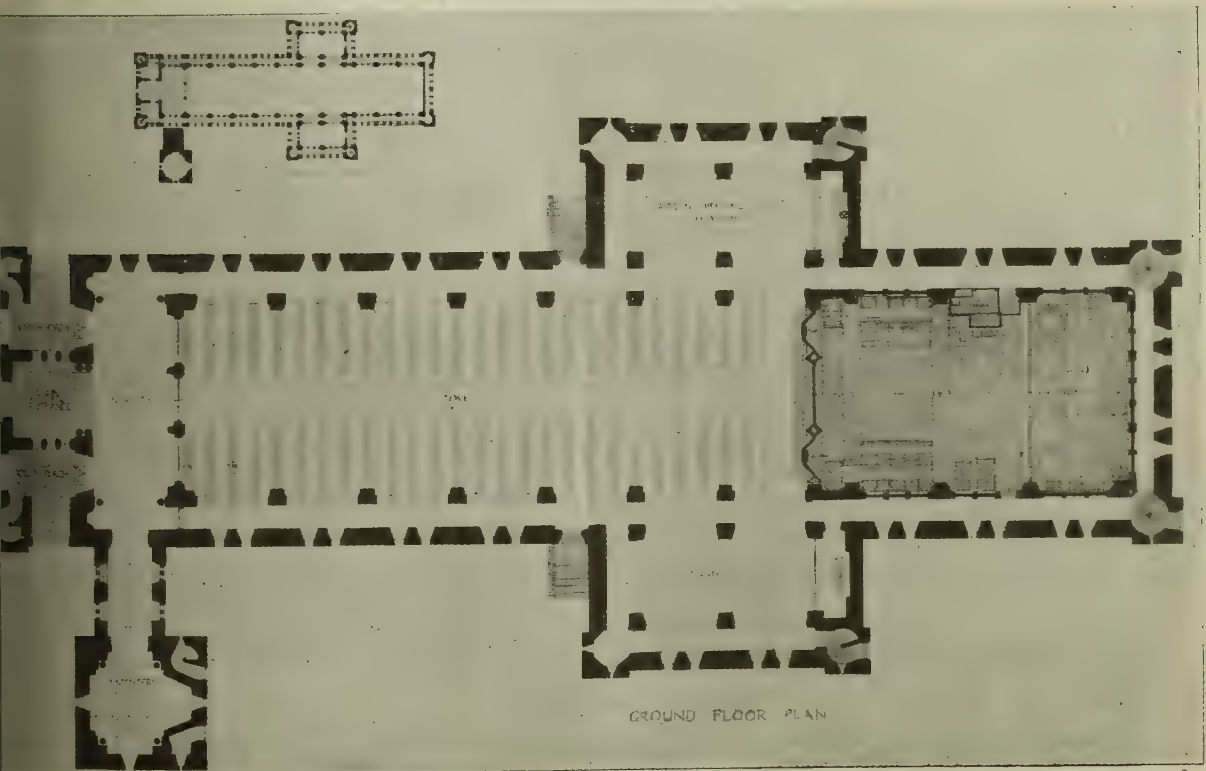
The architect was able to keep in touch with the progress of the work by means of photographs taken and sent home at frequent intervals. A general oversight was exercised on the spot, first by Captain Done, R.E., Director of Military Works in the Sudan, afterwards by Mr. W. H. MacLean, C.E., Professor of Engineering at the Gordon College in Khartoum, and, on the latter's transference to Cairo, by members of the Works Department of Khartoum.

Mention should be made of a scheme which has been drawn up and adopted for the grouping and regulation of memorial tablets in the church. Spaces have been set apart on the walls of the north and south transepts for the erection of these according to a definite plan, and some have already been executed and placed in position, those in the north transept being in memory of men who died in the rebellion in which Gordon lost his life and in the various expeditions for the relief or reconquest of Khartoum, and the ones in the south transept of others connected with the Sudan who have given their lives since then in the service of the country.

The north transept is dedicated to the memory of General Gordon, and on the west wall of this chapel is an inscription in large bronze letters fixed to the stonework of the wall, which reads as follows :—

PRAISE · GOD · FOR
CHARLES · GEORGE · GORDON
A · SERVANT · OF · JESUS · CHRIST
WHOSE · LABOUR · WAS · NOT · IN · VAIN
IN · THE · LORD

(R. W. S. W.)



Khartoum Cathedral: Plan.
Mr. Robert W. S. Weir, Architect.

THE BUILDING TRADE.

THE NORTHERN COUNTIES FEDERATION OF BUILDING TRADES EMPLOYERS.

We take the following from the annual Report for 1915 :—

State of Trade.

The war has to a very great extent prevented the realisation of any prospect there was for any improvement in the building trade since the presentation of the last Report. Unemployment among the operatives in the trade is light, but this is due to the large number of workmen who are working on munitions and Government work or have joined the colours. The continual rise in the price of materials has had a great effect in restricting the progress of general work, and in many cases contracts have been suspended and work actually in hand abandoned for the present. The action taken by the Local Government Board in withholding from local authorities sanction to obtain loans for building purposes, except in necessitous cases, has also acted detrimentally upon the trade. Any improvement cannot be expected this side of the satisfactory termination of the war and the restoration of normal conditions.

Apprentices.

The consideration of this question has occupied a large amount of thought and time, with the result that a new scale of wages has been drawn up and adopted with the object of inducing boys to come into the trade.

Scale of Wages Payable to Lads on Entering as Apprentices in the Building Trade as Joiners or Bricklayers.

First Scale.

Age Starting Between		Weekly Wage. s.	d.	
14-15	years at 1½d. per hour if a week of 50 hours worked	6	3	for 1st year
15-16	„ 2d. „ „ „	8	4	„ 2nd „
16-17	„ 2½d. „ „ „	10	3	„ 3rd „
17-18	„ 3d. „ „ „	12	6	„ 4th „
18-19	„ 3½d. „ „ „	14	7	„ 5th „
19-20	„ 4d. „ „ „	16	8	„ 6th „
20-21	„ 4½d. „ „ „	18	9	„ 7th „

Second Scale.

Age Starting Between		Weekly Wage. s.	d.	
15-16	years at 1¾d. per hour if a week of 50 hours worked	7	3½	for 1st year
16-17	„ 2½d. „ „ „	10	3	„ 2nd „
17-18	„ 3d. „ „ „	12	6	„ 3rd „
18-19	„ 3½d. „ „ „	14	7	„ 4th „
19-20	„ 4d. „ „ „	16	8	„ 5th „
20-21	„ 4½d. „ „ „	18	9	„ 6th ,

The weekly pay to be the same winter and summer.

Contract Matters.

Difficulties, as a result of the war, have arisen in carrying out many contracts, which have added very seriously to the cost of both pre-war contract work and work taken since the war. The executive and its officers have afforded advice from time to time to its members and have assisted them in their negotiations with their building owners and employers. Many cases have come to the notice of the Federation where members have submitted to losses which might have been avoided if members had protected themselves by the use of a fair form of contract or had better understood the provisions for their benefit included in their contracts. Arrangements have now been made whereby members as a benefit of their membership are now assured assistance in fixing up their contracts, and also in the preliminary stages of any difficulties of legal advice without additional charge beyond their ordinary subscription. Time and consideration have been given to other matters in the interests of members of the Federation, though the references above record the main work of the past year.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberystwyth.—The T.C. has passed plans of alterations and additions at the back of Derwen House, Thespian-street, submitted by Mrs. Evans.

Aldershot.—The U.D.C. has approved plans for additions to offices, Albert-road, for Messrs. R. Simmonds & Sons, and additions to building in York-road for Capt. Brown.

Argyll.—The Scottish Land Court has empowered the Board of Agriculture for Scotland to constitute two new holdings on the farm of Kilbride and Stronduich, in the parish of Kilfinan.

Boston.—Plans for extension of a packing-room at a warehouse in Tawney-street proposed to be made by Messrs. J. & J. Beaulah, for additions to the dressing-rooms at the Scala Theatre Company, Ltd., and for a washhouse on the Tattersall-road, proposed to be erected by Mr. J. Wise, were allowed by the T.C.

Bournemouth.—The B.C. has approved the following plans:—Extra lavatory accommodation, Queen's Park Hotel, Holdenhurst-road, Messrs. Strong & Co., Ltd.; additions, 83, Hankinson-road, Mr. G. Harding; amended plan, house, plot 221, Dunbar-road, Mr. H. Long; four maisonnettes, plots 119-122, Green-road, Mr. A. Barnes; house, plot 123, Keswick-road, Rev. K. S. Radcliffe; bakery, etc., corner Cleveland and Spring roads, the Parkstone and Bournemouth Co-operative Society, Ltd.

Bristol.—The Libraries Committee has a proposal for selling a bit of land so that a street may be widened to allow the W. D. and H. O. Wills branch of the Imperial Tobacco Company to extend their factory premises.

Burnham (Somerset).—The U.D.C. has passed a plan for a new garage in Regent-street, for Mr. W. H. Horril.

Burryport.—Plans for a new cinema have been referred to the Plans Committee.

Cardiff.—At a recent meeting of the Board of Management of the King Edward VII. Hospital, Cardiff, the scheme for extending the massage and electrical sections of the proposed new Orthopædic Department was made known, and it was announced that the plans had been approved. The Board referred the scheme to the Building Committee with power to accept tenders. The L.G.B. has held an inquiry into the proposal of the Corporation to construct a sewer from Borstal-avenue, Heath, to Fairoak-road, Roath Park, through the cemetery, in order to drain the cemetery and the newly-built-upon area on the Heath estate, for which a loan of £3,500 is required.

Dewsbury.—The following plans ha
approved by the T.C.:—Messrs. Wilma
additions to Meadow Mills; executor
Thos. Hanson, raising shed, Queen-stre
Ravensthorpe; Messrs. J. H. Walker
additions to offices, Ravensthorpe Mil
Hall Spinning Company, staircase tow
Hall Mills; Mr. Joe Haley, motor garage
road; Lord Savile, extension of Warr
Savile Town, also widening of Brett
Savile Town; Mr. D. H. Lumb, exte
motor garage, Crawshaw-street, Raven
Dr. Beattie, additions to coach-house,
hyrst.

Eastbourne.—The T.C. has approved t
ing plans:—Mr. H. H. Coles (Mr. F.
architect), internal alterations, 28, Hyde
Guardians of the Poor (Mr. F. G. Cool
tect), internal alterations, 1, Harti
Messrs. Thornton & Hunt (Mr. F. G
architect), addition to Hill Brow, Bolso
Guardians of the Poor (Mr. F. G. Cool
tect), addition to Cottage Home, Dac
Mr. F. E. Rayner (Mr. Stephen Fox,
Mr. F. E. Rayner, builder), addition t
Lodge, Devonshire-place; Mr. J. D.
(Mr. Andrew Ford, architect, Mr. J. D
son, builder), two houses, The Rotu
Anthony's Hill; Mr. O. Edmunds (Mr
Ford, architect, Messrs. G. Bainbridg
builders), internal alterations to K
Court; Mostyn Hotel Company (Mr.
Ford, architect), addition, Mostyn Hote
Hotel Company (Mr. P. D. Stonham,
addition, Mostyn Hotel.

Hendon.—Plans passed by the D.C.:
rear of factory, Renters-avenue, Mess
sons; alterations to clubhouse, Military
Willifield-green, Hamptead Tenants, L
additions, 51, Church-road, Mr. P.
revised plans of offices, etc., corner
avenue, The Hyde, Integral Propeller
Ltd.; five houses, Hillcrest-avenue, M
Massey & Co.; six houses, Brentmead-
A. J. Thompson.

Henley-on-Thames.—A new vestry is t
at the parish church.

Hexham.—The R.D.C. has approved
alterations to premises at Pearson's-ter
mitted by Mr. J. E. Hamilton, for M
Gloag; and plans of additions and alte
the cottages at the Hall Farm, Stock
Lord Allendale, and additions and alt
Slaley Cottage, Slaley, for Mr. S. Ca
Glen, Slaley.

London.—The Metropolitan Water
given instructions for tenders to be i
carrying out the necessary works of cle
painting at the Central Offices, Sa
W.C. A widening is to be made
corner of Brompton-road and Cromwel
a cost of about £1,000. An appeal is b
for funds to carry out an extension to
Jack Club for Sailors, Soldiers, and
situated in Waterloo-road, S.E.

Mortlake.—The Vicar of Mortlake ha
the gift of a site for a church on the
Estate.

Ruislip-Northwood.—The U.D.C. has
a list of roads and paths to be tarred t
the district.

Sunderland.—The Markets and Baths
tee recommends that the requisite repa
roof of the Hallgarth-square baths a
houses be executed by the Borough En

Swanage.—The U.D.C. has passed a
brick-built shed at the rear of Princess
Mr. J. Hunt.

Swansea.—Negotiations are being car
Swansea with a view to establishin
works for the treatment of ores.

Swindon.—Plans approved by the
Messrs. Groves & Sons, garage, Queen'

Wantage.—At a recent meeting of t
a petition from the inhabitants of De
asking the Council to construct a raise
on either side of the approach to D
Brook Bridge, was referred to a com
consider and report.

Wells.—At a recent meeting of
Council plans were submitted by Messrs
& Palmer on behalf of Mr. James Ga
the erection of a house and premise
site of No. 4, New-street. The Main R
Committee has decided to authorise t
tarring of a length of 6,471 yds. of mai
a sum of £230.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

CX.—No. 3825. MAY 26, 1916.

"ARCHITECT AND SURVEYOR."

MANY problems, ancient and modern, have been pronounced to be insoluble; among them we may recall the mediæval controversy as to the number of angels who could dance on the point of a needle, and the unsolved question he priority of the owl or the egg. One of the practical problems affecting architects is the serious question as ther a man's material prospects are better should he e himself as an "architect" or, on the other hand, as chitect and surveyor."

frequently say there is little in a name, but we sometimes at a good deal depends on it, and outside London most cts prefer the double designation mainly for the ng reasons.

work of the provincial architect is generally of a very nore varied character than that of his brother in London; usually include, in all but the larger provincial centres, land surveying and levelling, with a knowledge of the ite. If his practice lies away from a great centre he ore frequently than not takes out the quantities for his ork, and is therefore a quantity surveyor as well. Very e is a skilled valuer of property in addition, and all egoing give him an actual title to call himself "surveyor" ualify him for carrying on a widely varied series of tions. The provincial architect usually holds that it is d necessary to be equipped with the requisite knowledge le him to cope with a varied range of business, which ltimately lead up to building, and unless he is so ed he may share the fate of a specialist in a small town. st architects outside London are men of a wide range of dge, which enables them to give the most valuable to those dealing with property. Having to deal with atters concerning building, they make themselves ndent of extraneous assistance on which many London cts largely depend.

London architect, on the other hand, usually describes as an "architect" only. Sometimes he deals with surveying matters, frequently he confines himself to eparation of designs and the superintendence of actual More often than not, if quantities are required, a quantity or is employed, who in larger works takes a good deal of work off his shoulders, enabling him to devote a greater tion of his time to his purely architectural duties. In ases an architect feels that any addition to the title to detract from the emphasis which should attach to cture as an art; while he points out that the concentra- his efforts makes for efficiency and marks a distinction n him and the class of men whose practice is of a more aneous character.

title "surveyor" standing by itself has the dignity rical association. The great architects of the past, among may be mentioned Inigo Jones and Wren, were always ed as surveyors, a practice adhered to by the City nies, the Office of Woods and Forests, and many other That Wren's functions included giving businesslike on many very practical questions is proved by passages *Parentalia*, in which the manner he considered tenants of ty required for rebuilding or street improvements might e dealt with is described; in fact the terms "art" and tical," so commonly in use in the present day, are cuous by their absence from the records of the enth and previous centuries, and the cult of the self- on of the artist had not made its appearance.

e danger of the present practice seems to us to rest in the ption sometimes met with that the "architect" is not a practical man; while the "surveyor" is a distinction which sometimes leads to the "surveyor" or the "architect and surveyor" being called in with respect to some practical question connected with building, which may serve as an introduction to future building, whereas "architect" is passed over as not being a business man. We may assume that, while an architect may merit the title "artist," he will rarely get work given to him on this score, and that a reputation as a business man will cause people to consult him. It may be questioned by some whether an architect who has no knowledge of surveying *per se* has any right to describe himself as a surveyor in addition. We should be inclined to say that since the term "architect" used by itself is sometimes held to imply that a man has artistic but not practical qualifications, it is perfectly fair to supplement it with the addition "and surveyor" if it is held that this corrects a misapprehension. A survey of a subject implies a comprehensive view, and an architect, if he be a man of judgment, ought to be able to take such a view. Whether he is trained in actual surveying or valuation or not, he should be competent to form a sound opinion on the value of a building or site as an investment, and, as the most useful of all knowledge is to know one's limitations, he should know when to supplement his knowledge if necessary. The essential object is to give sound and trustworthy advice; the actual process by which that advice is arrived at is immaterial.

The title of "ghost" is given to a man who habitually supplies another's deficiencies, yet the so-called architect who knows his shortcomings and employs an able "ghost" is an infinitely safer man to employ than the possessor of the little knowledge which is so dangerous an acquisition. We are not defending an evil practice, and would much prefer to know that all architects were competent and made their own designs; but, as it is impossible to exclude all incompetent and ignorant men, we should be glad if some of them recognise their shortcomings sufficiently to prevent their clients suffering thereby.

The question of the advantages of specialising forms part of the problem, and with regard to it we may say that an architect will not necessarily work better for being confined to one class of work or one type of building, because such a limitation often produces weariness and a disposition to produce tame and uninteresting work. On the other hand, he will become a better planner and designer if most of his time is spent on such problems, and he is not occupied by work of the very wide range which often falls to the provincial architect. But the all-round knowledge of the provincial architect frequently produces a type of man who is exceptionally competent as an adviser, and such men promote confidence and respect for the profession wherever they exist. Like the general practitioner in medicine, they fill a position where a man of more specialised attainments would be almost useless, and like the general practitioner they are in many cases men of very great competence. A knowledge of surveying in the more restricted sense of the law of ancient lights, easements, and other questions affecting land and property is very necessary in London, and the architect with a good first-hand knowledge and experience in such questions forms a safer adviser to his client than one whose training and experience have been architectural only, which is an additional reason for thinking the double qualification a valuable one. But the question must be left to the individual for solution, as, like the mediæval problems we have alluded to, a good case can be made out for those who hold either view. But whichever solution we may prefer, we are convinced that one of the most valuable of all assets to the architect is what has been termed "the uncommon gift of common sense."

NOTES.

The Rebuilding of Sackville-Street, Dublin. Mr. Thomas Mawson, in a letter to the *Times*, expresses the hope that advantage will be taken of the deplorable destruction which has been wrought in Central Dublin to replan the area on broad and suitable lines. It is too often the case that good schemes are spoilt through the timidity which those in authority feel about interfering with private interests, which prevented, in Wren's time, the adoption of a lay-out which we should be grateful for to-day. We do not know whether the area affected was dealt with in the recent Town-Planning Competition held in Dublin, but if it was included some good scheme may have been brought into the region of practical politics by recent events. If not, it would be a wise measure to institute another competition for the area affected, and, since the tax-payer of the United Kingdom is to find the money, the competition should be open to all. There can, we suppose, be no question of extensive rebuilding during the war, and this should afford an additional reason for thinking the matter out thoroughly now.

The Double Choir of Glasgow Cathedral. Mr. T. L. Watson has written a revised and condensed edition of his former work on the "Double Choir of Glasgow Cathedral," a building which, he says, "provides the best illustration we have in any single building of the regular and consistent development of the early Pointed style of architecture." It was believed that the whole of the lower vaulting, except that of one small corner, belonged to one period, but Mr. Watson has demonstrated that no fewer than five distinct styles, each separated by an interval of time, can be traced in the vaulting of the choir. The book is admirably illustrated, particularly by a large plan of the lower vaulting, in which the different forms of ribs are distinguished by colour. Our knowledge of the past has been enormously increased of late years, as the discoveries of the remains of ancient Rome and of ancient Egypt prove, and each discovery makes others more possible, so that year by year the past gains in interest and colour, and is more definitely differentiated from a mere field of speculative interest.

Cannington Park Camp. Mr. St. George Gray, whose archæological work in the West Country is well known, has directed attention to the damage that has recently been suffered, in consequence of recent activities at the ancient fort of Cannington Park, distant about four miles from Bridgwater. Cannington, a place of much importance formerly, gave its name to the hundred; Camden derives the name from a British tribe, the Cangi. The earthwork lies on a steep hill of carboniferous limestone which rises to an altitude of some 260 ft. within the enceinte. Dry-stone ramparts, similar to those at Worlebury, Weston-super-Mare, encompass the camp; the entrance lies towards the east, and the outside passageway is strongly entrenched; a modern stone wall surrounds the whole. It seems that large trial-excavations have been made in the thin top layer of soil for the purpose of obtaining barytes, the "heavy spar," or sulphate of barium, much used for industrial purposes. A pack of mules, too (since removed by the authorities), did much injury to the ground, laying bare many relics of the ancient occupation of the fort; it is feared, moreover, that the search for barytes, which is plentiful in the neighbourhood, will be continued within the camp.

The Veterans' Club Association. We have received a copy of an appeal for funds from the Veterans' Club Association. The Duke of Bedford and the Lord Mayor are Hon. Treasurers of the Association, and the appeal is signed, among others, by Sir Frederic Milner, General J. Hills-Johns, Sir Arthur Conan Doyle, and Mr. H. Rider Haggard. It is pointed out that the establishment of a great club with branches all over the country would be a very suitable memorial to the heroes of the Great War, and may do much good when the establishment of peace is followed by the return of our soldiers and sailors. Among the objects which are mentioned specially in the appeal are the purchase and transfer to the club of a suitable building which is now in the market and its endowment as an Imperial Memorial, also the endowment of a splendid country house which has been offered to the Committee as a convalescent home, and it is estimated that for this and other purposes £250,000 will be required. Donations and subscriptions should be sent to the Lord Mayor or the Duke of Bedford, care of Messrs. Cox & Co., Army Agents, 16, Charing Cross, and the offices of the Organising Secretary are at 1, Adelphi House, Adelphi, W.C. The object of the promoters is an admirable one, and we trust their appeal will meet with a well-deserved success, as it should, despite the many demands these times bring with them.

Nottingham. The city of Nottingham is one of the most progr centres in England, and its corporation have foll the excellent plan of issuing a well-arranged bo which, after a brief descriptive *résumé* of its historic past, gi description of the facilities which it can offer to traders and on account of its municipal services and the disposition and cha of land available in its vicinity. To the foregoing is added a account of the trades and industries of which it is a centre. to similar methods of industry and publicity that Chicago ow enormous growth, and the geographical position in the centra of the United States is not unlike the position which Nottin occupies with respect to the east and west coasts of England. our canal system be enlarged and brought into line with m requirements, Nottingham would be a great gainer, situated a at the junction of the River Trent with the central canal quadril which passes by Leicester, Birmingham, Burton-on-Trent Warwick, from the points of which waterways communicate wi Severn, Thames, Humber, and Mersey, while it has an excep position as a great railway centre.

The New Laboratories, University College. The new chemical laboratories at University C designed by Professor Simpson, have now opened and form a very fine addition to the for scientific research in London. The buildings, we illustrated some time ago, are an inter illustration of the manner in which Greek deta be adapted in modern architecture, and indicate the arch great knowledge of historic art and his originality of expr Though we are not inclined to consider that the type adapted suited to the expression of modern wants, and think it is som out of place in a climate like our own, we are glad to bear test to the admirable skill and care with which the buildings are des It is within the power of many to copy, but unfortunately cor tively few can adapt, and Professor Simpson has shown his in this direction, and it is by this method that progress in tecture must be sought. We may not all think alike, no desirable that we should; the essential thing in design is th should learn to think clearly and express our thought convictions with vigour and understanding.

Gretchen.

[This pleasing example of modern work is by Mr. Charles Pibworth, Sc

HE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

. XXXV.—The Campaniles of St. Paul's and the Successors of Wren.

VREN'S sense of fitness was never shown
conspicuously as in his treatment of the
npaniles which flank the western front of
Paul's. Unlike many of the Renaissance
hitects who have essayed the solution of
ilar problems and given us a classic render-
of a Gothic outline, preserving strongly-
rked vertical lines, Wren's composition
es the form of horizontally-treated upper
ries, superimposed on the horizontal Orders
ler. The break back over the line of the
in front emphasises this feature, and if we
sider the campaniles by themselves we
struck with the difference of the treatment
pted from that Wren used in designing his
eples, which all show the value he gave to
sense of dominance given by strong vertical
s. Yet the western towers of St. Paul's
nowhere weak or ineffective in design, while
form as designed is in perfect harmony with
effective contrast to the great mass of
dome behind, against which they appear
ouetted. Like many other of the architect's
rks, the building as actually carried out
mproved out of all recognition as compared
h the design indicated on the original
wings.

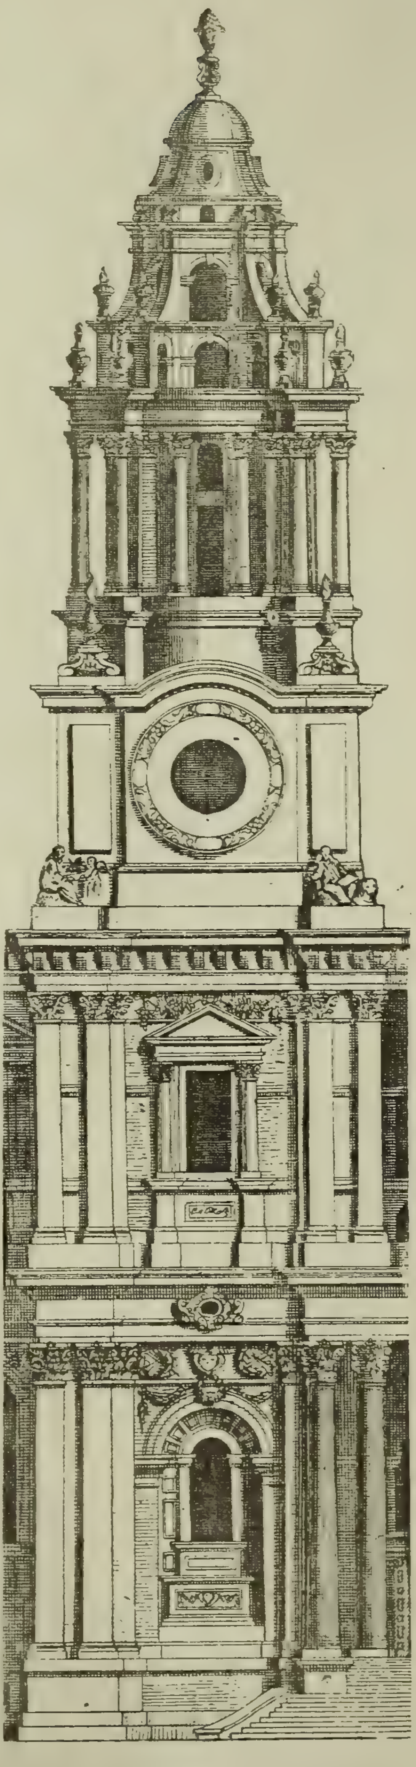
Vren lived to see himself discounted by a
nger generation, and the ingratitude with
ich the great are frequently treated was
mplified in his removal from office and in
petty persecution visited on him by the
horities for whom he had worked. More
n this, his architectural descendants and
owers imagined they could improve on
work, with the result that it was left to a
er generation rightly to estimate the great
f which separates genius from what may
termed capable achievement.

Gibb added an interesting but singularly
successful steeple to St. Clement Danes,
d, though he gave us in the church of St.
ry-le-Strand a very pleasing conception,
ecially in the steeple, the work is characterised
a smallness of scale and want of character
d vigour—qualities which are very marked
Wren's work. The later works of the
hteenth century are usually distinguished
the frequent use of the giant western portico
d the greater subordination of the steeple,
ile the "secularisation" of interior treat-
ent became more and more pronounced.
nbrugh and many of the later architects
re more lavish in the use of space, showing
ne of the careful economy and reserve which
tinguish the work of Wren. Had that
hitect been able to expend the ampler sum
ich a richer age placed at the disposal
its builders London would have gained
hitecturally; as it is, many of the later
rches suggest curious experiments in form
d a desire to create novelty regardless
the dictates of good taste. But, though
y fail to take the highest rank archi-
turally, they have great historical interest,
d form an intermediate stage between
at we may regard as the culmination of
e English Renaissance and the banalities
modern design.

◆

NEW CHURCH, GOLDTHORPE.

The church of St. John the Evangelist and
Mary, erected at Goldthorpe by Viscount
lifax, was consecrated a few days ago by
e Bishop of Sheffield. The church is con-
ucted of ferro-concrete, as is the presbytery,
ich communicates with the sanctuary by
ans of a covered corridor. The cost of the
eme was about £20,000. The architect
s Mr. A. Y. Nutt. An interesting feature
the interior is the baldachino, with its gilt
d black pillars supporting a canopy beneath
ich is suspended a crucifix in black. The
ations of the Cross are also an adornment of
e building.



The West Prospect of St. Paul's Cathedral.

(From Maitland's "London.")

PORTLAND CEMENT.

IN the last article dealing with this subject natural cements were discussed, and, by way of distinction, cements made by bringing together different raw materials are known as artificial cements. With the exception of certain special materials, such as slag cement and pozzuolana, which will be discussed subsequently, Portland cement is the only representative of this class of any importance, and transcends in its importance all other mortar-making materials. It is ninety-two years since our countryman Aspdin took out his patent for making cement from chalk and clay, and the development of this industry, which extends to all parts of the world, still continues. All natural materials vary in composition, but when separate raw products are used the composition of the resulting body is much more under control, hence the superiority of Portland over natural cements, which contain an excess of acid constituents, just as hydraulic limes contain an excess of basic constituents.

Chalk and clay—or limestone and shale, which will serve equally well for cement manufacture—are exceedingly cheap and accessible materials, and the comparatively high cost of Portland cement—apart from the question of trade combines—is due to the capital outlay required in the necessary plant for manufacture. Some idea of this outlay may be obtained when it is stated that it is not good finance to put down a plant unless at least 5,000,000 cubic ft. of material for every kiln erected is accessible.

Originally made in stationary kilns of the lime-kiln type, Portland cement is now prepared almost entirely in rotary continuous kilns and by the wet process, the two ingredients being ground up together in large machine-driven mills with water and the resulting "slurry" pumped into the kilns, where the first operation is the evaporation of the water. In rare instances the ingredients are ground and mixed in the dry state. The intermixture produced by the water is very complete; but not only does a heavy thermal loss result from the necessary evaporation of the water, but great outlay is involved in the construction and agitation of the enormous slurry ponds required to contain the liquid prior to its introduction into the kilns; and it is surprising that engineering developments have not led to a preliminary drying of the raw materials, followed by their attrition and intimate mixture and burning in a dry state to a larger extent than at present.

Deprived of water, the dry slurry loses carbon dioxide completely at 800 to 900 deg. C., and undergoes fusion further down the kiln (which is inclined from the horizontal) at a temperature of perhaps 1400 deg. C., which is well above the melting-point of cast-iron, after which the clinker is cooled and ground in ball mills.

The essential, and probably the only essential, ingredient in the manufactured cement, as in other hydraulic materials, which gives the strength on setting, is silicate of lime, and the proportions of lime and silica aimed at to give the best results are roughly three parts by weight of lime to one of silica. Since lime and silica are both readily obtainable, attempts have been made to prepare cement by their direct combination; but these have not been successful, for it is found that some fluxing agent is necessary to bring these bodies into combination. This is supplied in the shape of alumina, which is always present in clay to a considerable extent, and which itself forms an aluminate of lime, which is chiefly responsible for the initial set which all cements take before the main rigidity of the mass is developed. In practice, then, Portland cement is a mixture of silicates of lime and alumina, the amount of the latter, however, being small as compared with that in natural cements.

Owing to the rigid demands of users, the manufacture of Portland cement has been developed to conform to a very exacting series of tests, which form a reliable safeguard as to quality. These tests are fully described in the British standard specification for this material, and it is not proposed to discuss them in detail here, but one or two points in connection with them may be usefully considered.

The presence of sulphur in cement is often looked upon with suspicion, and in this connection it may be explained that sulphur in the chemical form of sulphate of lime is up to a certain amount a legitimate and indeed probably a beneficial and necessary ingredient. A small amount of sulphur in this form almost invariably occurs in the natural raw materials, and more is sometimes added, the effect of which is to retard the rate of setting. The British standard specification fixes 2·75 per cent. of sulphuric anhydride, SO_3, as representing the maximum amount of sulphur allowable, and, as the sulphur content is sometimes expressed in other ways, it may be useful to note that this amount represents 1·1 per cent. of actual sulphur, or 4·67 per cent. of lime sulphate, $CaSO_4$, which is the form in which this element chiefly occurs in cement.

Sulphur can, however, occur in a distinctly deleterious form as calcium sulphide, but, as such occurrence is very unlikely in Portland cement, reference to this matter may be reserved for discussion in connection with slag cements.

All cements after manufacture tend to absorb carbonic acid gas and moisture from the atmosphere, hence entire freedom from carbonate of lime, which is formed by such absorption, is hardly to be looked for. Easy evidence of carbonates is obtainable in any clerk of work's office by the bubbling produced when any acid, such as spirits of salt or even vinegar, is poured on the cement.

When long exposed to the air this formation of carbonate of lime proceeds sufficiently to seriously reduce the value of the material, and whether this has occurred may be roughly estimated by placing a little of a known fresh cement and of the sample to be tested in separate tumblers in equal quantity, say enough to just cover the bottom of each, adding to each simultaneously an equal quantity of diluted acid and noting whether the effervescence of the sample greatly exceeds that of the fresh material. This formation of carbonate and absorption of moisture will be evidenced by a lowering of the specific gravity of the cement, which for good material should be 3·10 to 3·15. This, it should be remembered, is not the weight of the powder relative to water as measured in a cube foot box—*i.e.*, of the dry powder, which is filled with air spaces—but the comparative weight of the air free particles, which is, of course, much greater. Even this cursory reference to tests must include some comment on the important question of expansion. All cements legitimately expand in setting, but a good cement will not show signs of disruption when set and heated for some hours in hot water. This can be readily ascertained by allowing a pat of neat cement about 3 in. across, made up on a piece of glass and shaped to resemble a slice off a large sphere, to set under a damp cloth, and then heating it in water just short of boiling-point for six hours. If this treatment does not detach the cement or produce cracks in the edges of the pat, the material may be used with confidence. The effect of heating gives an opportunity for defects to present themselves in a few hours which would take perhaps a year or more to develop in the cement as ordinarily used. If the cement possesses a proper chemical composition and is finely ground, troubles due to expansion after setting are not likely to arise.

Finally, a simple means of ascertaining whether useless inert matter, such as sand, exists in any sample may be cited. Pure Portland cement is entirely dissolved in diluted spirits of salt, in which such bodies as sand and ground furnace clinker are quite insoluble. Any residue left on treatment in this manner may therefore be confidently regarded as due to adulteration.

◆

FIRE IN OLD WESTMINSTER.

A fire, involving the internal ruin of one of the old Queen Anne houses, broke out in Westminster on Monday morning. The house in question stands at the entrance to North-street, one of the most picturesque and unspoiled relics of the early eighteenth century. Thanks to the prompt action of the fire brigade, the fire was rapidly overcome without loss of life or limb. The house is completely gutted.

ARTERIAL ROADS IN GREATER LONDON.

THE deliberations of the local authorities of Greater London upon the subject of the new arterial roads, proposed by the Traffic Branch of the Board of Trade, culminated in a final Conference on the 19th inst. at the Middlesex Guildhall, kindly lent by the Middlesex County Council for the occasion.

The chair was taken by Alderman N. Regester.

Mr. Hayes Fisher, who attended on behalf of the Local Government Board, said he was much impressed by the Report of the sectional conferences and the extraordinary unanimity of opinion it displayed; but he indicated that, in his opinion, any recommendation involving outlay by the Government must be long deferred. Nevertheless, he really thought we were getting appreciably nearer to the time when one central authority should control traffic and developments instead of the eighty local authorities and a Government department which now did so. He was sorry to see from the Report of the Retrenchment Committee that it recommended the abolition of the Traffic Branch of the Board of Trade, but he thought the Local Government Board would probably continue its work, and hoped in due course the duties of the Road Board would also be transferred to the same department.

In spite of the financial monster in the path, he did not despair, and agreed that much could be done by encouraging local authorities to prepare town-planning schemes; but he did not think that preliminary estimates, if made now, would be of much value by the time they were required.

The Chairman, in moving the adoption of the Report, expressed a hope that some means might be found of getting the new roads settled other than the procedure adopted for the Western-road through Parliament, which had proved very costly, and referred to Birmingham as an instance of settlement by co-operation between owners and authorities.

Several protests on minor disagreements as to the Committee's recommendations were received, but it was decided to refer them to the various Committees, who would continue their work, and that authority should not be given to pass the Report, which was then carried.

Mr. F. M. Elgood, Chairman of the Ruislip and Northwood District Council, then moved the following resolution:—

"That in view of the vital importance of securing the harmonious development of Greater London by carrying into effect carefully-considered schemes for the construction of new arterial roads, and more especially in view of the opportunity, which will be afforded by the construction of such roads, for the profitable employment of surplus labour in any period of unemployment which may arise after the war, this Conference, in submitting to the Prime Minister and the President of the Local Government Board the conclusions of the sectional conferences, desires respectfully to make the following suggestions:—

1. That all practicable steps should immediately be taken to induce local authorities to secure the reservation of the necessary land for such roads by the exercise of their powers under the Housing, Town Planning, etc., Act, 1909.

2. That in order to encourage and aid local authorities in thus exercising their town-planning powers—thereby securing that the projected roads shall be provided at a minimum of cost—the Government should, by means of co-operation between the various departments of State and the county authorities concerned, arrange that local authorities preparing town-planning schemes for their respective areas and including in these schemes the projected arterial roads shall be given a guarantee that a considerable proportion of the cost shall be borne by the central authority."

The resolution in its original form defined the proportion more fully, but it was felt that a general guarantee in this form would sufficiently reassure owners to induce them to co-operate without fear of heavy charges.

Mr. Elgood said the prime object of the resolution was to prevent the possibility of the scheme generally agreed being defeated for want of proper precautions, and pointe out that as matters stood owners of land wer afraid to take an interest in town-plannin schemes for fear of heavy liability for roads, etc of far greater widths than were required fo merely local purposes.

Mr. H. Aldridge supported, and said everyon wanted to know exactly where they wer Alderman Crow proposed referring the whol matter to a finance committee.

Another speaker showed that the Wester avenue was costing £100,000 a mile, and tha the 113 miles of new road proposed woul probably cost much more, thus involvin expenditure of at least £12,000,000 and further £170,000 a year for maintenance, an thought the poverty and high rates of intere of the next fifteen years would prohibit suc work. On the other hand, he did not see tha land-owners could be expected to defer develop ment of their land until such measures wer possible. The usual provision in most Ac was three or five years.

Mr. Hayes Fisher advocated a wide an general guarantee which would leave the doo open for negotiation in every direction.

The resolution was then carried.

Sir Aston Webb, K.C.V.O., then moved th following resolution:—

"That having regard, not merely to th large amount of time and trouble that has bee expended in the consideration and selectio of suitable routes for arterial roads in Great London, but to the extreme urgency of preserv ing the opportunity for creating the arteria roads which have been found by these confer ences to be necessary, and to the importan part these traffic avenues will play in the futur development and growth of the Metropoli this Conference is desirous of recording i opinion that it is imperative that steps shoul be immediately taken through the Loca Government Board or other authority t secure the routes of such new or improve thoroughfares as are set forth in the importan traffic proposals contained in the Report o the Conference on Arterial Roads in Great London."

In doing so he recalled the assurances give by the Prime Minister when he received th first deputation that the establishment of central authority would be considered, an hoped that the great success of the conferenc would show that this was the thing most neede to ensure the realisation of the proposals upo which so much valuable work had been don Already there were development scheme which imperilled some of the most importan proposals, and no time, therefore, should b lost. He did not support the lugubriou prophecies as to the paralysis of developmen after the war, but reminded the Conferenc of the great works carried out in London jus after the Napoleonic War.

Sir Alexander Stenning supported th resolution. He thought Parliamentary proc dure the only way, and urged that power be sought in the next session which woul secure all the routes agreed on.

Mr. Randolph Glen drafted a resolution i favour of giving county councils power to fi building lines in order to enable them to loo ahead and avoid the waste incurred by widen ings after developments had taken place but at the request of the Chairman it was with drawn, as it was thought that the questio might be dealt with by the Committee whic the Conference appointed to continue th investigations. The same Committee wa authorised to send a deputation to lay thei Report before the Prime Minister as early a possible.

The proceedings terminated with a vot of thanks to the Chairman and to the Middlese County Council.

The new officers of the Students' Unio Architectural Society of the University o Liverpool for the forthcoming year are:— President, Mr. Gordon Hemm; Secretary, Mr A. C. Holliday; Treasurer, Mr. T. Medina The purpose of this Society is the advancemen of the fine arts.

CORRESPONDENCE.

The Wonder of Work.

IR,—I do not quite follow Mr. Rickards, admits he has been following me for rs. That is very complimentary, and I nk him for referring to my "journalistic poses," for if trying to take an interest and trying to show the wonder of, the modern ld, the world about us is "journalistic," then greatest artists of the past were the greatest nalists; but mostly in art to day, unless artist colours photographs, harks back to a od he never knew, or perpetrates futurities onceal his incompetency, he is of no account he critic. Yet art is all about us and the is nearest to us—the art of our age, the nder of Work. But most artists are blind, as you architects call yourselves artists, ar your case is very much the same as that he painters and sculptors.

r. Rickards says that "architecture does exist to be exploited by the modern pictorial t." Well, from the earliest times architec-, if worth anything, has been exploited pictorial artists, and now architects are nxious to be exploited that they draw nselves, or get a "pictorial artist" to for them, or exploit themselves by ography. "The pictorial artists of my " do roam the world, not only to get rial, but to get some idea of what is being in the world, what has been done, and arn what is worth doing. If Mr. Rickards rds the work of to-day as "sensational," enormities," as "Brobdingnagian," Mr. ards has lines of superlatives; but, if you to think of it, the same adjectives have addressed to the Ark, the Tower of Babel, the Parthenon, and to-day they are fired e Woolworth Building and the gasometers erlin. Yet these will be the architectural ds of the age. Mr. Rickards tells me that le are "on the average less than 6 ft." therefore they do not want "enormous iors"; but the number of people wanting e accommodated in interiors of buildings so increased that everywhere but here esign has increased, the scale has increased, thing has increased to meet modern needs ot British architecture. And Mr. Leaning ly states the case, though he uses my s to do so. Engineers are the great s, especially in the Forth Bridge, the hester Ship Canal—and I don't remember ing else—these are the only works of rn art in Britain. And I prefer, as Turner Ruskin had to swallow it, a railway viaduct ing a landscape to a tame landscape with ame deer cooped up in it.

d not "the Whistlerites" continually aimed the beauty, the character of the to-day, had they not made the world t, why, as Whistler himself said, "The Briton would not even have been painted"

e great thing is to carry on tradition—radition of great art—and it is the great eers who to-day are doing so. Here there an architect is working with them, g down and slicking up, but it is the eers who are creating the Wonders of in the world to-day, and the most erful thing about it all is that the average tect does not know anything about it.

JOSEPH PENNELL.

Charing Cross Railway Bridge.

,—Whatever may be the fate of the -Eastern and Chatham Railway Bill, before the House of Lords, it will have amply proved that there is an over-ning case for its defeat. It is a matter satisfaction that a precedent has been ed by the House of Lords for hearing t evidence from the R.I.B.A. and the on Society on a matter which they are ecially qualified to judge. The issue is ubtedly a very serious one, for if the iple be conceded that the practical and ic interests of London are to take prece- of isolated projects, a most valuable asset ave been gained towards the right develop- of London. The aims of reformers are st always misjudged and misrepresented, t is therefore necessary to keep constantly in clear view the aims of such a body as the London Society. Its chief aim is to obtain forethought and consideration from a wide and generous point of view of the growth and development of London. It does not aim to formulate or dictate schemes for this or to usurp the proper authority of any other body. It does not aim to assist in the destruction of anything in or of London which is worthy to remain, and it certainly does not aim at schemes of wild and extravagant expenditure. If only the citizens and authorities of London really understand the aims of the Society they must support it in every possible way. All the forces which help to govern and improve London are represented in its ranks, and these have never been so completely in agreement on any one point of its policy as the insistence on a postponement of the Charing Cross Railway Bill until the whole development of the bridges, the roadways, and the amenities of this centre of London has been carefully considered. Now is surely the worst time of all which could possibly have been selected to create such a serious barrier to the well-being of London as the railway company project.

T. RAFFLES DAVISON.

OBITUARY.

Mr. E. A. Heffer.

We regret to record the death of Mr. Edward Arthur Heffer, which occurred at Norwich on April 3. Deceased was born in London on May 5, 1836, and was the son of Edward Heffer, picture-dealer and gilder, well known amongst artists. After receiving a private education, he entered the Government Head School of Design at Somerset House when he was fourteen years of age, and studied there under Mr. Richard Burchett and the visiting masters—Mr. J. H. Herbert, R.A., and Mr. Richard Redgrave, R.A. He remained there two years, and was awarded in 1852 the National Medal for Linear Perspective; also he took the first prize for Chalk Drawing and for Practical Geometry. After spending some months in sketching from Nature in the neighbourhood of Hampstead he was introduced to Mr. John Thomas, sculptor of the New Palace, Westminster, and architect of Somerleyton Hall, Suffolk, and numerous other buildings. After being with Mr. Thomas for four years, at the age of twenty-one he went to Liverpool, where he began practice as an architect and designer of ornamental and decorative work. He designed the National School and Public Offices at Wavertree; a school at Walton-on-the-Hill; a warehouse in South Castle-street, Liverpool; the Mayer Lecture Hall and Art Gallery and the Free Library at Bebington, Cheshire; and Pennant House at Bebington, and various residences in the neighbourhood of Liverpool. His chief work, however, which occupied four years, was the church of St. Bridget at Wavertree. The church was fully illustrated by wood engravings drawn by the architect and published in the *Builder* in July, 1871. Deceased returned to London in 1875, and carried out works at Hampstead and Kilburn. The Red Tower; Messrs. Phillips & Page's music warehouse; Mr. Stuart's shop in the High-road; the Queen's Park Hall, Kilburn; various shops and villas in West End-lane; and the Emmanuel Boys' School at West End-green were designed by him. In 1875 deceased made a design for a cathedral to be built on the site of St. Peter's Church, Liverpool and read a paper on the subject before the Historic Society of Liverpool. When, after some years, the competition was organised, he submitted a design for the cathedral on St. James's Mount and made a model of it, which was exhibited at the Walker Art Gallery at Liverpool and much approved. In 1892 Mr. Heffer removed to Norwich, and carried out several hotels and other works. Deceased found time to enter over seventy competitions, and gained several premiums. Among others, he gained the premium offered for a design for the Albert Memorial Clock Tower at Hastings, and was entrusted with the work of building it. He also obtained the premium of 100 guineas for his design for the improvement of the White Rock-parade at Hastings and 50 guineas for his design for the Town Hall. In Hastings, too, he built Tudor House for the late Alderman Ross. At the age of nineteen he exhibited at the Royal Academy, and again in subsequent years his work was to be found there. Illustrations of his buildings have appeared in the *Builder*. Apart from architecture, he designed domestic and church furniture, plate, clocks, and many other things incidental to his profession. Like most architects, he was fond of music. He painted, too, in water-colour, doing many works both in landscape and figure. He also painted in oils.

NEW GOVERNMENT CONTRACTS.

War Office.

Barrows.—Davey & Armitage, Elmer-avenue, Southend-on-Sea; J. Edwards & Son, Inkpen, Hungerford.

Boards and Trestles.—Parnall & Sons, 44/5, Broadmead, Bristol.

Bolts and Nuts.—Bayliss, Jones, & Bayliss, Ltd., Wolverhampton; Burton, Delingpole, & Co., Moseley-street, Birmingham; F. W. Cotterill, Ltd., Atlas Works, Darlaston; J. Gadd & Sons, Ltd., Blackheath, Birmingham; Guest, Keen, & Nettlefolds, Ltd., London Works, near Birmingham; Horton & Son, Ltd., New Alma Works, Darlaston; Lindley & Co., Ltd., Beauvoir Works, Luddenden, Yorks; W. Miller & Sons, Ltd., Monmore Green, Wolverhampton; Nuts and Bolts (Darlaston), Ltd., Foster-street, Darlaston; Steel Nut and Joseph Hampton, Ltd., Wednesbury; J. Wiley & Sons, Ltd., Eagle Works, Darlaston; Willetts Bros., Old Hill, Staffs.

Cranes, Electric.—Babcock & Wilcox, Ltd., Renfrew

Endless Chain Haulage Gear.—Wantage Engineering Company, Ltd., Wantage, Berks.

Granite Road Metal.—J. Mowlem & Co., Grosvenor Wharf, S.W.

Paint.—James & Co., Ltd., Ouseburn Lead Works, Newcastle-on-Tyne; Locke, Lancaster, and W. W. & R. Johnson & Sons, Ltd., 306, Burdett-road, E.; Mersey White Lead Company, Ltd., Warrington; Pinchin, Johnson, & Co., Ltd., Pinchin's Wharf, Silvertown, E.

Pumps.—Beck & Co., Ltd., 130, Great Suffolk-street, Southwark, S.E.; Holman Bros., Ltd., Cambourne, Cornwall; Lee, Howl, & Co., Ltd., Tipton, Staffs; J. Tylor & Sons, Ltd., Belle Isle, York-road, N.

Ranges, Stoves, etc.—Albion Iron Company (London), Ltd., Belper; Callender Iron Company, Ltd., Falkirk, Stirlingshire; Carron Company, Carron, Stirlingshire; Dobbie, Forbes, & Co., Larbert, Stirlingshire; Forth & Clyde and Sunnyside Iron Company, Ltd., Falkirk; Stirlingshire Iron and Stove Company, Ltd., Bonnyside Foundry, Bonnybridge, Stirlingshire.

Roofing Felt.—D. Anderson & Son, Ltd., Roach-road Works, Old Ford, E.; Graves & Co., Ltd., Waterford; F. McNeill & Co., Kirkintilloch, Glasgow, etc.

Steel, Constructional.—The Aston Construction Company, Ltd., Eagle Wharf-road, Hoxton, N.

Tanks.—G. Adlam & Sons, Ltd., Bristol; Baldwins, Ltd., 35, Orchard-place, Blackwall, E.; F. Braby & Co., Ltd., Ida Works, Deptford, S.E.; Braithwaite & Kirk, 15, Henry-street, West Bromwich; Davies Bros. & Co., Ltd., Crown Works, Wolverhampton; T. Fildes, Thornton-street, Manchester; John Lysaght, Ltd., Bristol; Midland Tank and Ironplate Company, 241/3, Heneage-street, Birmingham; T. Piggott & Co., Ltd., Atlas Works, Springhill, Birmingham.

Works Services.—Drainage at Canterbury: Geo. Browning, St. George's-place, Canterbury; drainage at Ipswich: Cubitt & Gott, Westerfield, Ipswich; sewage disposal works at Arborfield Cross: E. C. Hughes, Albion Works, Wokingham.

Erection of—A.O.D. stores at Burscough: J. Booth & Sons, Hulton Steelworks, Bolton; buildings at Edinburgh: W. McNiven & Sons, 1, Yeamen-lane, Edinburgh: buildings at South Farnborough: Wm. Harbrow, Ltd., South Bermondsey, S.E.; buildings at Turnhouse: Watson & Sons, 53, Caledonian-road, Perth: entrance offices at South Farnborough; Wm. Harbrow, Ltd., South Bermondsey, S.E.: offices at South Farnborough: Wm. Harbrow, Ltd., South Bermondsey, S.E.: platform retaining walls at Hilsea: Jno. Croad, Portland-street, Portsea; sheds at Woodbridge: Wm. Harbrow, Ltd., South Bermondsey, S.E.; stores at Newhaven: A. Roberts & Co., Ltd., 74, Earl's Court-road, S.W.; temporary structure at Altcar: F. R. Hipperson, Northumberland-street, Norwich; provision of concrete floors to stables at Shirehampton: Geo. Pollard & Co., Ltd., Taunton.

LAW REPORTS.

OFFICIAL REFEREE'S COURT
(Before Mr. POLLOCK.)

Spencer, Santo, & Co., Ltd. v. The Commissioners of H.M. Works and Public Buildings.

ON the hearing of this case being resumed,*

Mr. Holman Gregory, continuing his opening, said he would not dispute the fact that the architect, in reason, was entitled to make omissions, but it was for the Referee to say whether the omissions made had or had not altered the character of the work which the builders had contracted to carry out. The defendants contracted with the plaintiffs for them to do certain work which was to cost £473,000, to include all labour and general charges, and if the defendants called upon plaintiffs to do other work and abandoned part of the contract the plaintiffs were entitled to extra payment for the other work and for any loss of profit which might have been made from the work abandoned. As to the stone supplied for the work, counsel said that it was not of the quality which it should have been according to the contract. A large quantity of it was wholly wasted owing to its bad quality, some of the blocks being full of black flint and sand shells. Condemnations of the stone were constant throughout the execution of the work, and much of it was rejected by the clerk of the works after it had been worked in the stoneyard.

Mr. P. H. Patten, the foreman engaged on the job throughout, in the course of his evidence said that before the contract was signed he commenced to lay-out the work, and the building was actually commenced in the earlier part of March. At that time he had no knowledge of the revisions which were going to be made. From time to time the plans were revised and variations made by the architect. Generally speaking, the building erected was skinned of everything that could be taken away from it. It was made more costly, and was nothing like the building as originally designed. Orders were given continually for alterations in work after the work had been done. The elevation was practically the same in appearance, but the details were altered and made less uniform. As to the brickwork, the walls were reduced in thickness to the extent of about 4½ in.

The witness was subsequently examined upon minute details of the work which had not been done, by direction of the architect, upon which the plaintiffs would have made profit, and the amount of profit which would have been so made had the contract been carried out in accordance with the original drawings. On the question relating to extra work and omission, he said that the contract related to the construction of three towers, two of which were omitted, with the result that the plaintiffs had lost on the amount of brickwork involved. There were also omissions in the sub-basement resulting in a diminution in the brickwork to the extent of 20,000 ft. super. This was the cheapest part of the work, and went to make up the average upon which the contract was based. It was cheaper because, being on the lower level, no hoisting was required. Another item which went to make up the plaintiffs' claim was the variations which had been made in the height of some of the brickwork, for which plaintiffs were entitled to make a charge beyond the contract price.

There were numerous alterations in the windows which increased the cost of labour, and the smaller quantity of masonry in parts, consequent upon the altered plans, involved quite as much cost for labour, while at the same time it reduced the plaintiffs' profits. In some cases there was more labour expended upon the smaller quantities than there would have been upon the larger. In the original drawings there were fifty-one chimney-stacks shown, twenty-eight to be built in stone and twenty-three in brick. The stone stacks were to contain originally 612 cubic ft. of stone, but under the altered plans they contained only 296 ft., and owing to the altered character of the work and the smaller blocks used more labour had to be expended upon the smaller than would have been expended upon the larger. There were many other alterations and variations of the plans both in the structure and the internal arrangements from the basement to the roof, including the drainage, which involved a large amount of extra cost upon the plaintiffs and caused delay.

Cross-examined by Mr. Acland, K.C., the witness admitted that the terms of the contract gave the architect for the Office of Works power to vary the plans or to give part of the work to other contractors if he thought fit. As to the brickwork, he said that that omitted increased the cost of labour in proportion, and reduced the profit accordingly. If the estimator had known that certain concrete work was going to be omitted he would not have put a different figure down. By taking away the concrete work the unit of value had been disturbed, and he maintained that the contractor was entitled to the whole amount for which he had contracted. The omission in the concrete work amounted to 175 yds. out of a total of 13,000 yds.

Sir R. Acland: If the estimator had known that the omission was going to be made would he have put a different price on it?

Witness: I do not say that he would have done so; but it disturbed the whole thing.

In further cross-examination the witness said that the contractor had been put to greater expense in consequence of the alterations and omissions.

Mr. Patten during his subsequent cross-examination, after having been eight and a half days in the box, was unable, owing to the constant strain to which he had been subjected, to continue his evidence, and it was arranged that his further examination should be postponed and other evidence interposed.

Mr. F. Durrant, the managing director of the plaintiff company, was accordingly called and examined by Mr. Compston, K.C., as to the various payments made during the progress of the work upon the architect's certificates and the value of the work remaining to be done at various periods when such payments were made.

The case was proceeding when we went to press.

Claim by a Builder.

ON Tuesday, May 9, in the West London County Court, before his Honour Sir W. Lucius Selfe, Albert Johns Sullivan, builder, Hogarth-road, Earl's Court, sued Mr. and Mrs. Holdenstone, 93, Warwick-road, Earl's Court, for £18 11s., the balance of an account for work done.

Mr. Ernest Williams (instructed by Messrs. Gill, Ryle, & Davey, for the plaintiff) informed his Honour that plaintiff had given a verbal estimate for the alteration of the drainage at 93, Warwick-road—which the male defendant had purchased in the summer of 1915—in order to satisfy the requirements of the sanitary authority. Two estimates were given, one of £23 and a second of £12 4s., which were accepted, and there were smaller items ordered subsequently which totalled £35. In the course of the operations it was found that a new manhole which had been proposed would not be required, and that the original one if repaired would meet all that was needed. The estimate for this was £15, and there were other items, bringing the total up to £53 4s. Defendant had paid £35, and in December declined to pay more, alleging that he had disbursed the whole sum contracted for.

Plaintiff, in his evidence, said that on July 1, 1915, he was called in to estimate for this work by Mr. Matthews, of Messrs. Matthews & Chester, house agents and surveyors. He looked over the job, and his original quotation was £24 5s. Some difficulty arose as to a manhole; he had estimated for a new manhole at £8 10s., but the sanitary inspector discovered the old one, which he said would suit if repaired. His estimate for this was £15, and that amount was agreed by the male defendant; £35 had been paid on account up to December last. While the work was in progress Mrs. Holdenstone was frequently present, and on one occasion said the work was being done for her, as the house was her property.

Answering Mr. Sanderson (for the defendants), plaintiff said the surface of the ground had been opened by another builder and the drains exposed before he was called in by Mr. Matthews, and on the occasion when he received the job and gave his estimate only the male defendant and Mr. Matthews were present.

Mr. Sanderson: I suggest that from start to finish Mrs. Holdenstone was not present and never gave you any order?

Plaintiff: She was there when the work was ordered, and constantly while it was going on. She said she had employed other people, but they had been sent away.

James C. Matthews, estate agent, said he had sold this house to Mr. Holdenstone, who paid him the price. It was found necessary to have the drains attended to, and Mr. Traies, Notting Hill, was first employed in the work, his estimate being £22. Some differences arose as to branch drains, and plaintiff was called in, and he estimated the work at £23. It was af wards that the repair of the old manhole substituted for the construction of a new on £8 10s., which brought the estimate up to The other small items charged in the plainti account were reasonable, and the £1 10s. plans sent to the sanitary authority was than the usual £2 2s. allowed for that item.

Mr. Fleming, assistant sanitary inspec Kensington, also spoke to the necessity the change as to the manhole and reasonableness of the plaintiff's extra charg

Defendant, a consulting engineer, said he bought this house as a present to his wife his own money, and it was absolutely all had. Plaintiff's estimate was made verba and was for £35, to include the manhole. told plaintiff that what alterations w necessary must be done at low rates, as (defendant) could not afford big prices. Plai replied: "I'll make it as reasonable a possibly can for you. If I have a little mo from time to time I can get my mater cheaper for cash, and it will be to your ben say, £34 to £35." This was to include ev thing. He was not aware of the amount had paid plaintiff till December, when the b returned his cheques, and when he found had paid £35 he declined to pay more, as considered he had disbursed the whole amo of the estimate.

His Honour: There will be judgment aga the husband for £18 11s. and costs.

Claim for Surveyors' Fees.

IN the Marylebone County Court recently issue as to what was a "retainer" was rai in an action for 10 guineas, fees of a survey brought by Messrs. Flood Brothers, est agents and surveyors, 8, Westbourne-grove, against Mrs. Frances French, Spencer Ho Queen's-gardens, Lancaster-gate, W.

The facts stated to the Court were that the summer of 1914 the Oxone Shoe Compa who held the lease of certain shops at 19, We bourne-grove, desired to vacate the premi Defendant was approached by the plaintiffs, she agreed to take up the remainder of lease term at a reduced rent. This portion the transaction being completed in an intervi Mr. E. Farman, plaintiffs' manager, sugges that she would be desirous of steps being ta to have the rateable value reduced. suggestion appeared to Mr. Farman to c mend itself to the defendant, and under impression the firm wrote her on August 28 "As soon as the leases are exchanged you no doubt take steps to have the rating adjus We appreciate that there is a possibility getting the rateable value reduced, and shall be happy to act for you in the matte To that letter there was no answer. September 4 Mr. Farman had occasion to Mrs. French on matters relating to insuran and they afterwards discussed the steps to taken to obtain the desired reduction of assessment. With this view it was stated to defendant that the lease of the premises m be produced to the Assessment Committee. that she authorised Mr. Thornton, her solicit to hand the lease to the plaintiffs, and this done. Mr. Farman attended before the As ment Committee on October 5, and, supporti the lease with the special knowledge he had property in the neighbourhood, succeeded getting a reduction of the rateable value fr £330 to £260. Then an account for servi rendered was sent to the defendant, w disputed the 10 guineas charge as too high.

Mr. Farman gave evidence as to these fa and stated that, according to the Institute sca the plaintiffs could have charged 16 guineas.

His Honour: That scale does not apply this class of business.

Stating her case, the defendant said that gave no instructions to the plaintiff firm appear for her, and she admitted writing to plaintiffs that, "being a woman, I thought would undertake this business out of kindnes and she repeated that now. She denied th she had in any interview given them a retaine

His Honour held that the plaintiffs, bein professional firm, could not be assumed to acting from philanthropic motives. Defend must have understood. He held that plaintiffs were to act for her before the Asse ment Committee, and he doubted not but she was gratified at having the rateable va of the premises reduced. In these circu stances his Honour held that what she h acquiesced in and had done in fortifying plaintiffs' position by supplying them with lease amounted to a retainer. He ruled th the Institute scale of fees did not apply he and awarded them 7 guineas.

Judgment was entered for that amount, w costs.

ENERAL NEWS.

Town-Planning Schemes.

epresentatives of various Scottish munici- ties met in Edinburgh City Chambers ntly and discussed Craigentinny town- ning scheme with members of the Town nning Committee of Edinburgh Town Council a view to the probable adoption of a lar scheme in their own districts.

he Henry Saxon Snell Prize, the Royal Sanitary Institute.

ne subject given in 1915 for the essay in competition for this prize was "Suggestions mprovements in the Sanitary Arrangements Appliances suitable on Board Ship for (*a*) engers and Crew, (*b*) Cattle and other Live k." Seven essays were sent in, and they been brought under the consideration of Council. The adjudicators for the competi- were Messrs. W. Collingridge, M.A., M.D., 3, A. Wellesley Harris, M.R.C.S., the late bert Williams, M.D., and J. J. Welch, M.Sc., ist.C.E., M.I.N.A., Professor of Naval nitecture, Armstrong College (University Durham), nominated by the Institution Naval Architects. Acting upon the advice ne adjudicators, the Council have awarded prize offered of 50 guineas and the silver al of the Institute to Mr. Wm. Hanna, M.A., .. Assistant Port Medical Officer, Liverpool, ing under the motto "Nautilus."

Architects and Military Service.

number of members of the Royal Institute British Architects who are about to enlist ne Army or to be summoned to the Colours er the operation of the Military Service have called the attention of the Council the desirability of making arrangements nable them to enlist in a selected corps, so they will have the advantage of serving a number of men of their own class and ession. With the approval of the Central uiting Depot, arrangements have accord- been made with the Queen's Westminster es. Applicants must, of course, be fit for ral service and must be capable of passing tests imposed by the regiment. Any nbers (whether attested or unattested) desire to take advantage of this opportunity ld apply immediately to the Officer Com- ding. Administrative Centre, Queen's tminster Rifles, 58, Buckingham-gate, S.W. are invited to call on any week-day ept Saturday) at 2 p.m., and they should e that they desire to take advantage of arrangements made with the Royal Institute British Architects.

Ancient Stained Glass.

the *Times* of Monday the following er by Mr. Thackeray Turner, Chairman of nmittee of the Society for the Protection Ancient Buildings, appears :—

SIR,—This Society has received so many iiries as to how ancient stained glass should protected from the risk of bombs dropped aircraft that it hopes you will be willing allow it to state briefly its views. From direct action of splinters it is thought that only protection is to remove the glass and it in a vault. But there is no doubt that dows run a risk of destruction from air ssure due to explosion at a distance, and thought that a screen of ¾ in. of rough board- standing in front of the window would in ny cases save the glass. Where there are tresses on either side of a window, the rding might be fixed on the face of them. other cases, where the windows light the und floor, the screen might be fixed to fold poles, and, of course, if the expense wo thicknesses of boarding with an air space ween them were allowed, the protection ld be still greater. In many cases the glass be sufficiently far back from the face of wall to be protected by fixing wood uprights inst the wall on either side to carry the rding. It is thought that covering the dows over in this way would be a cheap thod of providing a reasonable protection inst air pressure, but it certainly would not a complete protection."

The Leicester Galleries.

An exhibition of recent portrait drawings by Mr. Will Rothenstein was opened on Wednesday at the Leicester Galleries, Leicester-square.

Street-Watering.

In the House of Commons on Monday Mr. Long, replying to Sir R. Baring, said he had seen references in the Press to a proposal of certain Metropolitan Borough Councils to abandon street-watering during the coming summer, and would cause some inquiry to be made into the matter. His advisers would not endorse a policy which involved such a stoppage, but they would probably agree that there were cases where the amount of watering done in ordinary times might be reduced without risk. He had not heard of the abandonment of street-watering by provincial authorities.

The Reconstruction of Sackville-Street, Dublin.

A representative Conference has been held at the Mansion House, Dublin, under the presidency of the Lord Mayor. Amongst others present were the principal officials of the Corporation, representatives of the Local Government Board, the Chamber of Commerce, the Royal Institute of the Architects of Ireland, the Architectural Association of Ireland, and the Housing and Town Planning Association of Ireland. The Conference considered a Memorandum submitted by the Lord Mayor suggesting that the Government should take such immediate action as would prevent the rebuilding of destroyed premises without reference to a general improvement scheme. The decision of the Conference was at once conveyed to the Local Government Board for transmission to the Prime Minister. The Lord Mayor subsequently had a conference with the Prime Minister, at which the Prime Minister expressed his desire to provide every necessary facility without delay. The powers sought, if approved by Parliament, will enable the Corporation and the public departments concerned to meet the present emergency rapidly and effectively.

The Royal Institute of the Architects of Ireland.

At a meeting of the Council of the Royal Institute of the Architects of Ireland, held to consider the conditions which would affect the rebuilding of the destroyed premises or areas in the City of Dublin arising out of the recent rebellion, the following resolution was adopted :—

"His Majesty's Government having indicated its intention of taking steps to facilitate the restoration of the destroyed buildings in Dublin by proposing to assume, as the maximum of its grant, the same liability as would have fallen on the insurance companies had their policies covered loss arising out of the rebellion, the Council of the Royal Institute of the Architects of Ireland would urge on the Government the desirability in making these *ex gratiâ* grants of imposing conditions or restrictions with regard to the design and reconstruction of individual buildings in important thoroughfares such as Sackville-street, Eden-quay, Abbey-street, Earl-street, and Henry-street, so that they shall conform to some general scheme of street improvement. The Council would emphasise the necessity of imposing such restrictions, inasmuch as the Municipal Council has no control over the design of new buildings other than as regards their street alignment, sanitary fitness, and the fulfilment of certain conditions in regard to construction. The Council would urge on the Government the advisability of attaching such conditions to these grants so as to ensure that public money should be expended in the interests of property owners and the enhancement of the architectural dignity of the city. To achieve this object the Council of the Institute would respectfully suggest that a Commission be appointed to control the conditions subject to which designs for new buildings would be sanctioned. Control should be exercised in such matters, among others, as general street improvement, harmony and symmetry in the design of new buildings, and the settlement of questions in regard to right of light, party walls, etc."

Deceased Architect's Estate.

The late Mr. James Gillespie, of 4, Queen-street, St. Andrews, a member of the firm of Messrs. James Gillespie & Scott, architects and surveyors, left, in addition to real estate of considerable value, personal estate valued at £11,239.

The Australian Capital.

It is reported that the Commonwealth Government has appointed a Royal Commission to investigate charges of blundering in connection with the works of the new federal capital (Canberra). The Senate has debated a motion to rename the Federal capital Anzac. The change of name was opposed by the Government and the debate was adjourned.

House-Building.

Presiding at the annual meeting of the Sheffield Property Owners' Protection Association in the Builders' Exchange, Mr. James Morrison gave some figures showing the decrease during recent years, even before the war, of the erection of property in Sheffield. He said that in the period 1901-5 new houses certified for occupation numbered 2,000; from 1906 to 1910 they were 1,629; and then in the period 1911-15 there was a decrease to 615. In 1913, the year before the war, they numbered 542, thus showing that the decrease had nothing to do with the war; in 1914 the number was 570, and last year 399.

The Late Mr. R. A. Briggs.

We regret to announce the death of Mr. Robert Alexander Briggs, which occurred in London on May 10. Deceased was articled at the age of eighteen to Mr. G. R. Redgrave, of Broadway-chambers, Westminster, for three years. From 1879-83 he was assistant in the offices successively of Mr. G. Moreing, Messrs. Isaacs & Florence, Mr. E. C. Lee, and Mr. J. J. O'Callaghan (Dublin). In 1883 he was awarded the Soane Medallion and £50 for a design for an Academy of Music. He started practice in 1884. He was elected Associate of the Institute of Architects in 1882 and Fellow in 1892.

War-Time Restrictions on Art.

Queen Alexandra paid a visit to the Royal Amateur Art Society's exhibition, at 25, Park-lane, on Tuesday. Sir Ernest George, A.R.A., in an address, said he might be regarded as old-fashioned if he insisted on the first importance of drawing. There was often the temptation to break out in colour and to talk of "tone values" before the elementary knowledge of drawing was acquired. In the search for novelty for its own sake pretentious nonsense too often obtained a hearing. Be it "Cubist" or other folly, it found its votaries. The attempt to bring in a "new art" was too often made by those who had not learned the grammar of the old; who thought to avoid serious study and the drudgery of taking pains.

Air-Craft Insurance.

The Council of the Surveyors' Institution desire to remind members of the need for precision in defining the property which it is desired to insure and the risks which are to be covered in connection with the Government Insurance Scheme. "In the majority of cases," the Council state, "air-craft insurances have been effected through the agency of the insurance companies in whose offices the property concerned is insured against fire, and the description of the property and of the risks insured against contained in the fire policy have been followed. The terms of a Government scheme are necessarily the subject of a stricter interpretation and a closer audit than is always enforced by an ordinary insurance company competing against others for the favour of the public, and the War Risks Insurance Committee have decided that they cannot accept liability for the payment of professional fees in respect of services in connection with reinstatement unless specially insured by a separate item, nor for the cost of reinstating boundary walls, fences, paving, etc., unless definitely included in the policy. When existing fire policies have been followed this can be done by an endorsement slip attached to the policy, and members desirous of including other matters within the insurance are recommended to take that course."

ILLUSTRATIONS.

Two Lithograph Drawings.

THE "Baroque Madonna" in a church in Venice and the "Bridge to Peace" are from two lithographs produced by Mr. E. A. Rickards as posters, and are interesting examples of his well-known methods of draughtsmanship.

Campanile, St. Paul's.

Mr. Norton's admirable outline drawing gives a clear idea of the manner in which these great features which add so much to the beauty of Wren's cathedral are built up. We refer to them in an article on page 381.

Houses in the North of England.

We give illustrations of two houses designed by Mr. Edward Cratney, the planning and design of which are very architectural and pleasing.

"Montmartre" and "Design for Drop Scene."

These two illustrations are from the very excellent etchings included in the collection recently on view at the Suffolk-street Galleries by members of the Italian Society of Etchers and Engravers. The decorative character of Cesare Fratino's drop scene is admirable, and the rich baroque feeling and suggestion contained in it will prove suggestive to many of our designers. The etching of Montmartre, by Anselmo Bucci, gives the character of that quaint corner of Bohemia, and would make a fitting background to Murger's "Scènes de la Vie Bohème." The work of the Italian Society is unusually full of vigour and character.

Ward End Church.

This church is erected to serve the wants of a poor district. We gave two views in our Academy issue of May 5, in which will be found a description of the work, which is conceived in a very original and interesting manner.

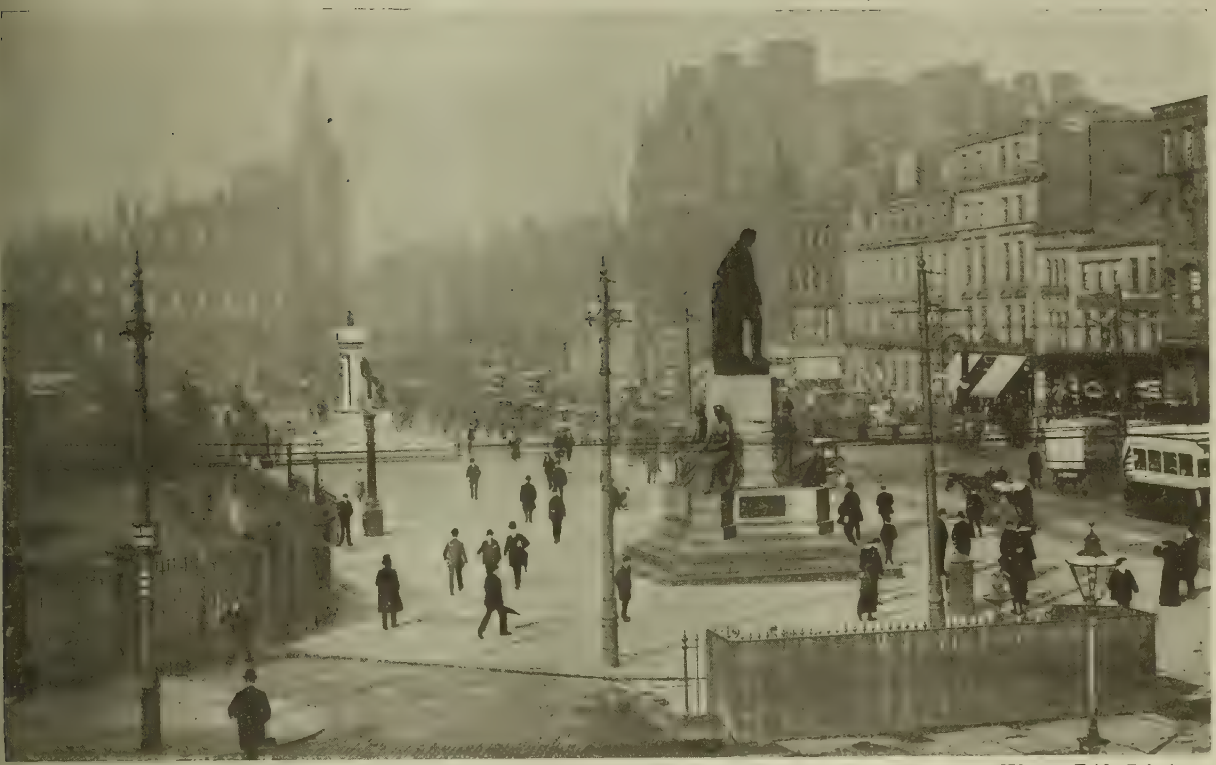
Mr. Edward Cratney, Architect.

HE MONUMENTS OF OUR PROVINCIAL TOWNS.

II.—MANCHESTER.



[*Photo.: Frith, Reigate.*

Fig. 1. Piccadilly.

HE most striking feature connected
with the monuments of Manchester is
the way in which they are collected
er and used principally to adorn two
ree squares and thoroughfares. The
ity are, in fact, to be found in Albert-
, Piccadilly, and St. Ann's-square.

principle of such an arrangement is
ent, tending as it does to the creation of
rtistic centres in a city.

se centres are often, moreover, of great
ercial or municipal importance, and both
culpture and architecture are brought
close association with the large number
ople who pass daily to and fro about
work. This constant association must
upon many minds something of the
g and elevating influence of artistic
ht.

numents should not, however, be used to
ent a square indiscriminately. They
form an integral part of the scheme and
nected to their surroundings, recognising
the thoroughfares and secondly the
ngs.

ert-square, Manchester, is found to suffer
seriously from the arrangement of the
aches. Its shape is that of an oblong rect-
one side being occupied by the municipal
ngs, and the three others by various office
and by shops. Five statues are arranged
ne upon an island pavement in the centre,
tram-routes pass through the square
either side of this island. The main
aches, unfortunately, are not axial,
ter at the angles of the square, thereby
g any vista more or less impossible.
best view obtainable from the main
ach is at a very acute angle, and it is
when the visitor actually emerges into
uare itself that sculpture and buildings
e seen in reasonable relation. There
o roads which enter opposite the block
nicipal offices, but they are so unimportant
hey cannot receive serious consideration
proaches. In these circumstances, the
s are rightly made to face the municipal
buildings; but by so doing they have a very broken and uninteresting background. The long straight row of five statues is not the most desirable arrangement, but was perhaps unavoidable.

Passing from this site to Piccadilly (Fig. 1), there is a great difference in the surroundings and circumstances. Naturally, as it at present stands, the vacant land once occupied by the infirmary gives the whole place a most desolate air. But this must eventually be built upon, and it is at once obvious that, if these statues are to be successful, whatever building is erected will have to be connected to them by its scheme of lay-out or recognise them in its massing.

Piccadilly is a street and not a square; and in spite of its width and the ample space available the monuments could not be justified except by their connection to a building. They will undoubtedly be difficult to incorporate successfully in this way, and this difficulty will be increased by the base of the principal group (that to Queen Victoria) (Fig. 2), which consists of a large flight of steps, square on plan—quite in keeping with an open park site, but here out of place.

It would seem a suggestion worthy of consideration that Watt and Dalton should be entirely removed. They are very poor in design, without life or expression, and have no sentimental or other value which would make their loss very seriously felt. Three statues in the length of this space instead of the present five would be amply sufficient.

Besides these two sites there is a small square in front of St. Ann's Church, the situation and lay-out of which make it an ideal position for monumental work. Located quite close to several of the main arteries through the city, it is yet not itself crowded by electric trams, flying taxi-cabs, and all the bustle and hurry of modern life. Its principal group can readily be seen from the chief of the main roads, passing a short distance from the entrance to the square, and when the pedestrian turns aside to examine and enjoy the work he is not in danger of life and limb or of being a block to the progress of those of his fellow-creatures who, at the moment, have no leisure to examine sculpture or read inscriptions.

St. Ann's-square is entered at one end by Exchange-street, a short connecting-link from the main road; the vista at the back of the square is closed by the façade of St. Ann's Church. The principal group within its precincts is the South African War Memorial, by Hamo Thornycroft (Fig. 3), which is placed on the axial line of Exchange-street and just within the boundaries of the square. The Cobden Statue—a much older monument—is on the same axis, but further back. The position of both is very satisfactory.

The grouping of statues in well-defined areas in the manner now under discussion has a further point in its favour in that anyone interested in the sculpture of the city can see the principal groups with much more ease and certainty than is the case when they are scattered at street junctions in all parts of the town.

Having thus glanced at the general placing, it will be well to turn to the consideration of the separate groups in detail.

Commencing with Albert-square, by far the most important monument, by virtue of its size, is that to Prince Consort (Fig. 4). This is on similar lines to the Albert Memorial in London—a type of monument which seems to have delighted the architects of the Gothic Revival. The architecture of this group was designed by Messrs. T. Worthington & Sons, and the figure of Prince Consort modelled by M. Noble. The base of the design is a square flight of steps, and upon this is placed a high base, in the upper part of which are modelled panels, the whole being guarded by an elaborately-designed iron railing.

Protecting railings, such as these, placed at the base of a monumental structure, while they may sometimes have an element of richness, are, nevertheless, purposeless features. With adequate police supervision there is little risk of serious damage from the action of the general public, and the amount of traffic up and down the steps for the purpose of a closer inspection of the work is not likely to cause any considerable amount of wear and tear. Their presence seriously detracts from the freedom and atmosphere of the monument, and gives a feeling of closeness and a suggestion of repulsion which is very detrimental to the effect of the complete group.

To return, however, to the design itself. Upon the base before mentioned is a canopy modelled obviously upon the design of the Albert Memorial in London, and inside this a standing figure of the Prince. The monument is a fair average specimen of the work of the time. No one would now think of designing a Gothic structure of this kind, but architectural monuments in themselves undoubtedly have a great force and an effect which the simple sculptured figure, combined even with an elaborate pedestal, can never possess. They convey a suggestion, moreover, of an appreciation of architecture by the lay public which is most beneficial to any art. When the public of the present day appreciate the value of architecture as the perfect expression of contemporary civilisation, the architectural monument will return to favour, not, of course, devoid of sculpture, but forming a field in which the sister art can be displayed to its own greater advantage. This has been, in fact, the case in the last few years in Germany and also in the United States.

Upon either side of the monument to the Prince are placed respectively statues to the memory of Oliver Heywood and John Bright (Fig. 5). Each is of marble upon a white granite base, the figures being modelled by Bruce Joy, one in 1894 and the other in 1891. The design of the bases is simple and direct, containing few mouldings and no enrichment, yet not being devoid of interest, which makes them very suitable for their position. Anything small in scale or of weak outline would be quite out of place in so large a square. The figure of Bright is well in harmony with the base, and the small projection of the moulding, crowned by a high weathering in addition to the blocking, is a point worthy of notice. If this capping be compared with that upon the War Memorial in St. Ann's-square, although the latter is quite different in design, it will be seen how much is gained by the small projection given to the older example. In this instance, as in most of the Victorian work, the detail of the sculptured figure is very tame. Modern work is usually better in this respect, but it should be quite possible to impart life and vivacity to the monument without the introduction of Rococo forms in the architecture or an excessively literal rendering of natural features in the sculpture, both of which are foreign to true art.

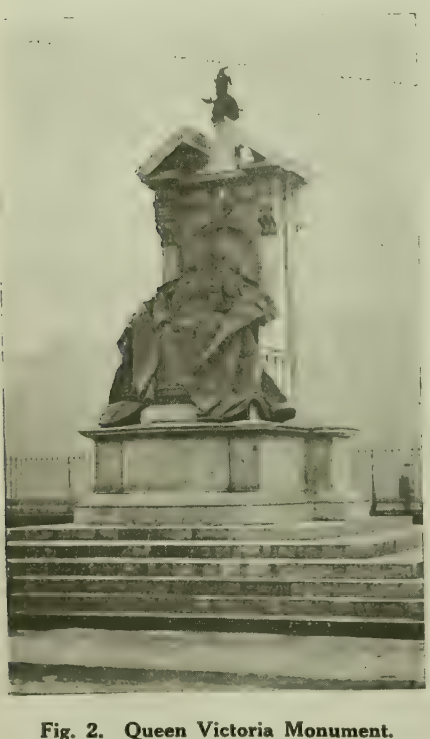


Fig. 2. Queen Victoria Monument.

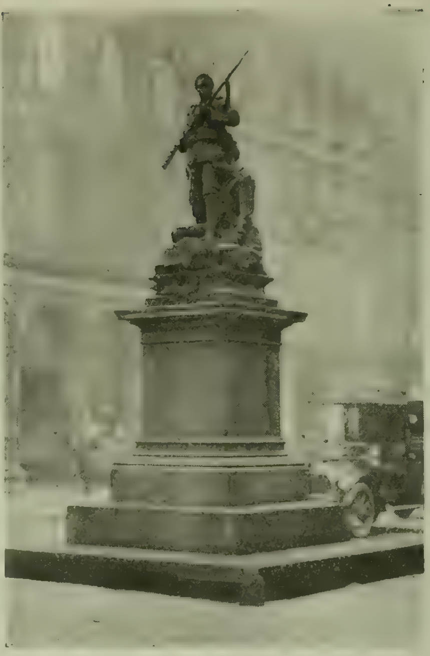

Fig. 3. South African War Memorial.

In addition to these groups, Albert-square contains a monument in bronze by M. Raggi to Mr. Gladstone, upon a red granite pedestal. The attitude is cramped and awkward in the extreme. The great statesman is portrayed stepping partly forward and holding a roll in one hand, as if in the heat of debate he strove to reach his audience by sheer physical force. The conception was good, the idea praiseworthy, but the sculptor has failed to impart the necessary feeling to his work. So far is it removed from the sublime that it almost suggests the ridiculous. The lay public, with its usual intuitive realisation of indifferent work, has created a catch-phrase in reference to the attitude of the statue, and it is said that the roll indicates "the way to Mount-street."

At the opposite end of the paving to the Gladstone Memorial is a bronze figure of James Fraser, late Bishop of Manchester. The modelling of the figure itself is much above that of Gladstone, and is quite a good piece of work. It is from the hand of Thomas Woolner, R.A. The pedestal is of dark grey granite, a material much more in harmony with bronze than the red Peterhead common a few years before. This base has rather too many mouldings to be completely successful. The shaft is ornamented by three bas-relief panels and an inscription. The placing of the inscription upon the base at the back of the figure is a curious feature; after examining the modelling of the bronze it is necessary to walk to the far side to discover the name and title of the man whom it represents.

In the entrance hall of the municipal buildings, which, as previously mentioned, are in Albert-square, are two seated figures—one of John Dalton by Sir Francis Chantrey, and the other of Dr. James Prescott Joule by Gilbert. The latter is by far the more interesting. It represents Joule, who has a fine bearded head, looking at a small scientific instrument. The figure is in white marble, and the instrument in bronze. The introduction of a second material, giving a brilliant dark spot in a field of white, adds a masterly touch to a really good figure. The modelling of the head and beard are well carried out, and must be rather in the nature of an idealisation of Joule's own head, although probably he had well-defined features. The whole bearing of the group suggests not only the features of the particular man represented, but is an excellent portrayal of "a great scientist."

In the inner hall are several full-length figures and a collection of busts of various mayors and benefactors, dating from
to 1907. Few of these are of any great
and the majority are very plain and com
place representations of apparently not
interesting personalities. The early on
particular are quite devoid of interest.

The group of statues in Piccadilly
claims attention, and the two figures of D
and Watt, by W. Theed, may first be menti
These are both seated figures, executed i

pedestal is a study in contrasts. Its
portion presents broad flat surfaces,
scale, imparting breadth to the design.
this the large bronze panels are made
ing by a kind of surface enrichment,
ed of the names of those who died or
illed. The base and capping moulds, however, do not in any way echo these broad surfaces; they are thin, stingy mouldings, markedly lacking in precision and outline. In spite of these weak points the group displays a directness of handling and spontaneous effect which indicate an experienced hand and practised eye.

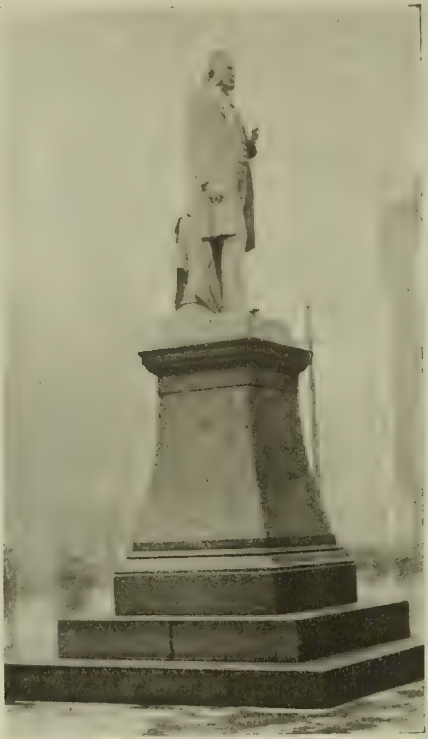

Fig. 5. John Bright Monument.

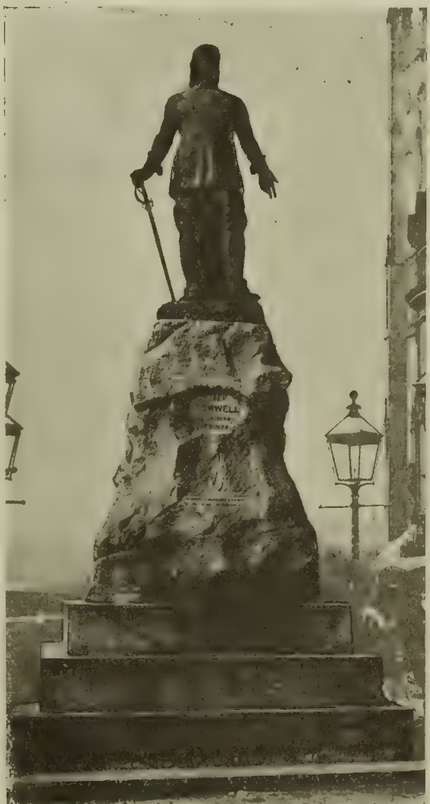
Opposite the cathedral and close to Exchange Station is a monument to Oliver Cromwell (Fig. 6), erected in 1875, and modelled by Matthew Noble, the sculptor of the Wellington group. The direction in which the statue faces is somewhat strange, the figure being made to look directly towards the façade of an hotel upon the angle of Victoria-street and Deansgate, and with its back to the main approach. The strength and appropriateness of the rough-hewn granite base is one of its best features.



[Photo.: Frith, Reigate.

Fig. 6. Oliver Cromwell Monument.

The most recent addition to Manchester sculpture is the Edward VII. Monument in Whitworth Park, by John Cassidy. For a park site the lay-out is remarkably uninteresting, and such an ordinary scheme of plain grass-plots, arranged entirely to suit the convenience of two or three insignificant paths, is in marked contrast to the beautiful carpet borders and floral designs almost invariably found in similar situations in France and Belgium. The architecture of this group is by far its best feature. The mouldings show a refinement and individuality which are most interesting; and, in fact, the whole pedestal is an excellent piece of work. The figure, unfortunately, is far short of this, and altogether fails to complete a group admirably begun by the architecture. The folds of the Garter robes, instead of imparting richness to the figure and acting as a connecting-link between sculpture and architecture, seem to drag down in shapeless lines from shoulder to heel.

The statues of Manchester, as a whole, are not upon a high level. For the richness, size, and importance of the city they are remarkably few in number and small in conception and scale, and are not to be compared to the large number of good groups possessed by the sister city of Liverpool. The Edward VII. Memorial is upon a larger scale than that of any previous monument, and, although in this case it has not met with complete success, the selection of a comparatively unknown man to execute the design is a praiseworthy action upon the part of the responsible committee.

It is to be hoped that future development and the growing appreciation of the plastic arts will lead to the erection of many fine groups, so that Manchester will become a great artistic centre as well as a great centre of commerce.

◆

WAGES IN THE BUILDING TRADE.

Kidderminster.—At the quarterly meeting of the Midland Centre Board of Conciliation for the Building Trades held at Walsall on May 11 an appeal was heard from the carpenters and joiners, bricklayers and labourers of this district, who had given notice for an advance of 2d. per hour in the rates of wages, viz., 8½d. to 10½d., 8½d. to 10½d., and 5½d. to 7½d. respectively. After hearing witnesses representing the employers and operatives of Kidderminster the Board decided as follows:—"That the wages of the carpenters and joiners and bricklayers of the Kidderminster district be advanced to 9d. per hour, and the labourers to 6½d. per hour, as from June 1 next, with a further advance to each of these trades of ½d. per hour at August 1 next, the rates then in force to remain unaltered until March 31, 1918."

London.—The question as to the rightful trade to fix and stop Uralite and other similar slabs, raised by the Operative Plasterers' Association, was considered by a Local Joint Trade Committee recently, and after full discussion the following resolution was carried unanimously:—"That where Uralite or slabs of similar make are used they shall be fixed by whichever trade shall finish the slabwork, *i.e.*, where stopped with plastic material by plasterers, and where fixed or finished by any other process than by plastic materials, then by carpenters." The question of whether stonemasons or bricklayers shall have the right to fix artificial stone was considered by a Local Demarcation Committee (National Scheme) on the 17th inst., and after full discussion the following resolution was carried:—"That inasmuch as artificial stone is used in so many different parts of a building it is impossible to lay down any hard-and-fast rule, this board is of opinion that the trade employed for fixing should be left to the discretion of the employer."

THE BUILDING TRADE.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

FOUNDED in 1866, this Institution this year attains its jubilee. Its object is to grant pensions of £30 per annum to necessitous clerks, or £24 per annum to their widows, for the maintenance and education of their orphan children, and for making grants of temporary relief. The thirty-ninth annual dinner, held on May 16 at the Holborn Restaurant, was a most successful function and was attended by close on 250 persons. Mr. F. Shingleton (Messrs. Leslie & Co., Ltd.) presided, and was supported by Sir H. H. Bartlett, Bart., Messrs. F. Higgs, F. G. Minter, W. Downs, G. H. Parker, R. C. Foster, H. T. Holloway, A. Ritchie, W. J. Renshaw, E. J. Strange, A. Strachen Bennison, C. W. Dunford, S. B. Depree, H. Northcroft, B. Carter, R. B. Chessum, G. H. Hadland, etc.

The usual loyal toasts, proposed by the Chairman, were enthusiastically received, as was that of "His Majesty's Forces and Allies," proposed by Sir H. Bartlett.

The Chairman, in submitting the toast of the "Builders' Clerks' Benevolent Institution," made a strong appeal for further funds. They were aware, of course, that many charitable societies during the present crisis were not holding festival dinners, but he acquiesced in the decision of their Committee to have the meeting, and was there to plead the cause of the Institution. They were all familiar with the history of the Institution, which that year attained its jubilee, and there was no need for him to describe the vast amount of useful work it had done. At the present time there was a very great need for further assistance, for owing to the lack of funds they had had to reduce the number of pensions from thirty-three to twenty-three. There was now a long list of persons awaiting election, and it was his hope that as the result of their generosity some of them might receive the benefits they so urgently needed. Some of his friends had been most kind in responding to his appeal, and he trusted that many connected with the building trade who were not present would also come to their aid.

Mr. John Austin (Secretary) announced that the sum of £534 11s. 6d. had been subscribed, and he hoped at least £550 would finally be forthcoming.

Mr. W. J. Renshaw, in proposing the "Architects and Surveyors," also referred to the fact that the Society had attained its jubilee and to the need for increased subscriptions if the good work was to be maintained. In the past architects and surveyors had shown their practical sympathy with the Institution, and they hoped it would continue. They had also to thank architects and surveyors for their courteous treatment of the representatives of builders. They knew that architects and surveyors had been very hardly hit in these strenuous times, although perhaps the architects had been mostly affected, because surveyors had been able to keep going by the adjustment of variations. Builders also had been badly hit, except a favoured few who were having the time of their lives. He trusted that after the war the Royal Institute of British Architects and all architects and surveyors would remember that conditions had been very adverse for builders, and would treat them sympathetically, so that the trade might benefit in what they hoped would be the splendid wave of prosperity in front of them in the future.

Mr. H. Northcroft, in reply, said that whatever architects were suffering applied also to surveyors. It was a matter for regret that Mr. W. Willett was no longer with them to see the successful result of his fight for the Daylight Saving Bill. He (the speaker) would like to see another great reform, which was the adoption of the metric system of weights and measures. This seemed to him the right time for pressing such a reform on the attention of the Government.

Mr. Godfrey Sykes proposed the toast of the "Builders and Builders' Merchants."

Mr. E. L. Strange, responding for the builders, expressed approval of the way the Government were taking up the interests of industry. As builders they appreciated the sterling services of their clerks, and in these strenuous times he hardly knew what they would have done without their whole-hearted assistance.

Mr. Alex Ritchie also responded, and suggested that the Institution should give first consideration to the claims of those who subscribed to the funds.

Mr. F. Higgs proposed the health of the Chairman, and warmly congratulated Mr. Shingleton on such an admirable result in abnormal times.

The toast was enthusiastically honoured.

[A war-badge was lost at this dinner. We shall be pleased to return it to the owner if it is sent to us.—ED.]

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The Electricity Committee of the Aberdeen T.C. has agreed to feu 11,887 sq. yds. of ground at Clayhills from the North of Scotland and Town and County Bank for the purpose of an extension to the electricity works.

Annan.—At a recent meeting of Annan Dean of Guild Court plans were passed for the erection of a glove factory at Mafeking-place, Annan, for Messrs. W. Tyrer, Sons, & Co.

Argentina.—The *Boletin Oficial* (Buenos Aires) of April 3 publishes a Decree approving the project for extension works at the hospital at Rio Cuarto, Province of Córdoba. A public call for tenders for the execution of the works will be made by the "Comisión Asesora de Asilos y Hospitales Regionales," Belgrano 909, Buenos Aires.

Bedford.—Plans approved by the T.C.:—Mess-room and lavatories, Messrs. W. H. A. Robertson & Co., Ltd.; extensions to lavatories, Messrs. W. H. Allen, Son, & Co., Ltd., Queen's Engineering Works; bathroom and water-closet, etc., Mrs. M. T. Hurst Hodgson, Abbey Cottage, Cardington-road; temporary coach-house, stable, and harness-room, Miss Penfold, 23, Lansdowne-road; store and motor shed, Mr. F. Ray, Cauldwell-street; new lavatories, Igranic Electric Company, Ltd., Elstow-road; new house, Mr. J. J. Stanton, Goldington-road; brass foundry, extensions to steel test house, etc., Messrs. W. H. Allen.

Bedminster.—The Bristol Docks Committee has approved of an application made on behalf of the Imperial Tobacco Company, Ltd., to extend their premises and buildings over a portion of the old Malago stream at Bedminster.

Bromley.—The Highways and Buildings Committee has recommended the following plans for approval:—Mr. G. A. Parsons' plan of motor shed, Somerford, Park-avenue; Mr. J. L. Woodhams' plan of covered way and timber store, Prospect-place; Messrs. T. Crossley & Son's plan of addition to garage, 122, College-road.

Buckie.—The T.C. has passed plans for smithy at Baron-street, for Mr. George Smith, jun.; new shop front at 9, East Church-street, for Mr. R. Gillan; and motor garage at Cross-lane, for Mr. George M'Kenzie, flesher.

Chatham.—The T.C. has passed the following plans:—House, Wyles-street, for Mr. J. Hawes; and exit subway at New Cinema at rear of the Empire Theatre of Varieties, High-street.

Clayton.—Plans for the following new buildings in Clayton have been sanctioned by the City Council:—Salt Cake Store to works, Ashton New-road; conveniences to works, Clayton-lane and Cycle-street; Sulphuric Acid Conce tion House to works, Chatham-street; re block plan of chemical works, Bank-st revised plans and section to Aniline Dye H to works; stables and garage to works, (street; garage and office, Clayton-lane; st off Howgill-street; shed to works, Crabtree- workshop to works, Crabtree-lane; loading to works, Turner-street; addition to cart she West-street; conveniences to works, Cycle-s

Crompton.—The D.C. has approved plan a temporary shed at Diamond Rope W coal, paraffin, and petrol store at Rutland and hot water shed for the Ash Spinning pany, Ltd.

Dundee.—The Works Committee of the has approved plans of new warehouses in town, for Messrs. A. & S. Henry & Co., Ltd

Epsom.—The U.D.C. has approved plan one pair of cottages in Upper Court-road Mr. E. Stredwick, and addition to garde cottage, West Hill House, Mr. Hayworth Mr. Mountain.

Foleshill.—The Guardians and Councils approved plans for mission hall, for the ch trustees at Holbrooks-lane; two houses for F. Smith, at Crescent-avenue, Stoke; amended section of the outfall sewer for Coventry Corporation at Stoke Heath.

Fraserburgh.—The T.C. has agreed to pu a wooden erection next the herring mart, a estimated cost of £29 10s.

Fulham.—The Ministry of Munitions granted permission to the War Seal Found to commence building operations upon the of the first block of War Seal Mansions t erected in Fulham. The work upon the fou tions will be started immediately.

Gillingham.—The Council has approved of a bungalow at Hempstead-road, Wigmore Mr. Filmer, submitted by Mr. Mattocks, a bungalow at Orchard-road, Wigmore, for M Masters, submitted by Mr. Mattocks.

Glasgow.—Glasgow Dean of Guild Court granted linings to the Scottish Co-oper Wholesale Society, Ltd., 95, Morrison-stree erect an extension to the tinware factor Shieldhall Works, Govan; Messrs. W. B. & Co., Ltd., oil merchants, 24, Queen-stre erect a still house in Crownpoint-road; the (Company, Ltd., mineral water manufactu 200, Commercial-road, to re-erect bu destroyed by fire in Commercial-road; an North British Electric Welding Company, 45, Hope-street, to erect a brick building Finnieston-quay.

Goole.—The T.C. has approved the follo plans:—Alterations to boiler shed, Bridge-s for Messrs. Webster & Bickerton, and addi to 110, Boothferry-road, for Mr. T. Newton

Grimsby.—The Grimsby Fire Brigade mittee adopted a new fire station exte scheme, which is estimated to cost £463 1

Hitchin.—The R.D.C. has approved the fo ing plans:—Extensions to Messrs. Kry Lahy's factory, Work's-road, Letchworth; e sion to power station, Works-road, Letchw for First Garden City, Ltd.

Huddersfield.—The T.C. has decided to to the L.G.B. for financial assistance to 300 houses for the working classes. It is posed to build twenty-five houses at Br eighty at Long-lane, Dalton, and 19 Waterloo.

Hythe.—At a recent meeting of the T.C. i agreed that the Surveyor should prepare fications for a brick building for housin steam-roller, and that tenders be invited fo building.

Leyland.—A plan of a proposed dining h Thurston-road, for the Leyland Motors, Ltd been approved by the U.D.C.

Linthwaite.—Plan of a garage at Ban road, for Messrs. John Crowther & Sons, has been approved by the U.D.C.

London.—The justices have sanctioned for alterations and additions to the Red Rosoman-street, Finsbury. The Licensing tices have sanctioned plans for alterations Palladium, Argyll-street; Jermyn Court Piccadilly-circus; and Regent Restaura Air-street. The L.C.C. has sanctioned ex ture for the execution of improvements, at the following schools:—Bermondsey, Chaucer, providing cleansing station; Bo Bromley, High-street, additional exit; Por Industrial, escape ladders; St. Pancras, S., chester-street, drinking fountains; Whitec Buxton-street, adaptation; Woolwich, Plum work to schoolkeeper's house. The Counc also made arrangements for the repair of p of Putney Bridge, Wandsworth Bridge, Westminster Bridge (eastern approach). have been approved by the L.C.C. for wid of the L.B. and S.C. railway bridges over (dish-road and Bleak-lane, Tooting Bec Cor and modification in the structure of entrances to the Warwick-avenue station London Electric Railway.

Merfield.—Plan for the erection of a garage in Doctor-lane has been approved b D.C.

Milmrow.—The Council has approved p the proposed addition to the dyeing sh Birch Mills.

---

* See also our list of Competitions, Contracts, etc., on page 392.

Kilpatrick.—At a recent meeting of Old
ick School Board intimation was made
e Department had approved of plans for
oposed new schools at Whitecrook and
ir.

TRADE NEWS.

Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester, have recently supplied their patent Manchester stoves to the Sealburn Sanatorium, Ryton-on-Tyne.

Under the direction of Mr. Robert Frew, architect, Irvine, Boyle's latest patent "air-pump" ventilators have been adopted for a new hosiery factory, Troon, N.B., and hosiery factory, Irvine.

We are informed that Messrs. Hughes, Bolckow, & Co., Ltd., of Middlesbrough, Newcastle, and Blyth, have purchased the business as carried on by the Andrews-Hawksley Patent Tread and Engineering Company, Columbia Works, Poplar, E., and that the plant and machinery in connection therewith have been removed to Battleship Wharf, Blyth, where in future the business of manufacturing these stair treads, which have been before the public for a great number of years, will be carried on. We understand that in connection with the manufacture of these patent treads Messrs. Hughes, Bolckow, & Co., Ltd., will use their old seasoned battleship timber oak and teakwood.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3826. JUNE 2, 1916.

THE QUICKSANDS OF CIVILISATION.

THE whole of the arts are an outcome of civilisation past and present, and on the permanency of civilisation they depend for their continued existence. When Louis XV. said "Après moi le déluge" he cynically expressed his conviction t future generations would have to pay heavily for the esses of a period in which misgovernment and corruption e rife—a price which involved the destruction of idreds of the historic houses of the courtly past, the ttering or destruction of art treasures, and the rebirth of dern France from the bloodshed and ashes of revolution. overthrow of Roman power by the barbarians set back clock of history for centuries, for the glories of the Italian aissance would not have seemed to compensate for the es which man and time had inflicted on the Imperial City hose who knew the nature and extent of Roman art and lisation.

So, too, Belgium and North-Eastern France cannot be for y generations what they were before the present outburst arbarian fury had damaged in a few months all that the of centuries had created; and it may be questioned whether kind has not lost more in the process of war and the aclysms of destruction which have marked the fall of pires than that which now remains to us. What is left to of ancient Egypt and Rome was not preserved because of respect felt by the conquerors, but owing to the physical culty of obliterating and destroying their colossal numents; but the same conditions do not apply to what kind has since built, as the fate of many a city has nonstrated in the last eighteen hundred years.

Nor is the destruction which follows war the only danger ch our buildings have to face, for another incentive is given the effect of growth of population and the conditions brought ut by the enormous increase in the value of urban property. arge proportion of our older churches in London occupy s which have become extremely valuable, and when to this dded the continual need of the Church for funds to carry its necessary work many an historic church may be said to built on the edge of a precipice. In lower New York the wth of the city frequently renders the demolition of buildings nty or thirty years old a good business proposition, and we e no reason to think the process is at an end yet. We may d as we think for posterity, but it becomes increasingly cult to predicate what the wants of that posterity will be. Government of London has passed through as many tean changes in fifty years as it did in several centuries viously, and the process is far from being ended now.

So whether a state of war or one of peace obtains forces estruction which affect architecture are always in operation, ch must cause speculation as to the possibility of devising thing which will be left untouched by the tides of truction and will enable us to preserve some of the itage of the past for the enjoyment of the future.

Though time is only relative, most of us would feel less erest in a building which we knew would have to be nolished in fifty years than one we think will serve its purpose many centuries; while it gives us keen satisfaction to know t a few of our London buildings escaped the Great Fire, we have for them an affection which partially depends on siderations outside their intrinsic merit.

It is interesting to consider whether the processes we have rred to will operate more and more quickly with the passage of time, or whether we can by any method attain to methods of living and working which will render war an impossibility and obviate the necessity for the continual alteration of our objective, which renders the work of the generation useless for that of the next.

As far as war is concerned, it may be hoped, and possibly reasonably expected, that we are in the midst of the last effort of nations to alter the destinies of Europe by means of conquest. It is quite conceivable that out of the present chaös the United States of Europe may in the course of another fifty or a hundred years take definite shape, and that the problems which its constituent nations will solve together will be the elimination of actual want and the exploitation of methods of production to attain this end.

But if the civilisation of Europe is to possess architecture which is to serve for future generations it must solve questions which our forefathers were only dimly aware of, if indeed they understood them at all. One of these is the ultimate population and area of our cities, for unless some approximate limits can be arrived at all means of communication, centres of distribution, and public buildings will be conceived on too magnificent or too mean a scale. The last involves the future necessity for destruction and the loss of the capital, the former waste and ill-directed effort. To architects especially these questions are important, as it is far easier to persuade the public to spend if the expenditure creates capital value than if it is a haphazard guess arrived at on insufficient data, as is too often the case now. We must do away with the possibility of hampering future generations by our mistakes if we are to gain the consent of the public to great and far-reaching improvements, just as we should arrive at some *modus vivendi* between capital and labour if both are to have full employment in the production of the more permanent forms of artistic expression.

Mankind will tend more and more to preserve wealth in portable and easily realisable forms if they feel that there is no certainty that socialistic legislation will not be introduced, stripping them of profits to be made from land and building. Want of reasonable security will make us a nation of middlemen anxious to secure quick profits on trading transactions, and ready at any moment to transfer wealth to countries where freer conditions obtain.

On the other hand, it is all-important that a means should be found of convincing labour that there is no wish or intention to exploit it unfairly, and it is likely that the payment of a greater share of profits in the form of wages would lead to increased production if the distrust which is the curse of industry and the cause of recurrent strikes were eliminated. Few of us would buy the greatest masterpieces if we knew that in twenty years their colours would inevitably fade from the canvas; and in the same way we cannot convince people that it is wise to invest money in land or building if they feel its saleable value may be diminished by legislative enactments or by changing circumstances. And these factors should be taken into consideration by all those who are interested in the production of art, for they have a more direct and vital interest in the well-being of the community than almost any other class. The operator in stocks, the merchant, and those who cater for the daily wants of the people are, it is true, affected by conditions of instability, but they are not altogether dependent on the conditions which obtain in any one country, whereas the architect and to a large extent the sculptor and even the painter are if their work is of a decorative character.

Instead, therefore, of the "artist" being divorced from practical life and living in the clouds of fancy, he is more vitally interested than others in the fruits of good government and in the closing of the avenues which lead to dissension and unrest.

The quicksands which surround civilisation are those of war, of social unrest and instability, and the dangers due to a failure to consider the effect of the growth of population; and all these problems are of the first importance to those pract the arts who are anxious to demonstrate that it is reaso to expend money in beautifying our cities and our lives. T who practise the æsthetic arts should be enthusiasts, but sh not lose sight of the fact that it is wise to master the prac knowledge which enables them to advise others when and to spend wisely. Comparatively few have use for art luxury; many may be inclined to expend money on it if it be shown to be a reasonable investment.

◆

NOTES.

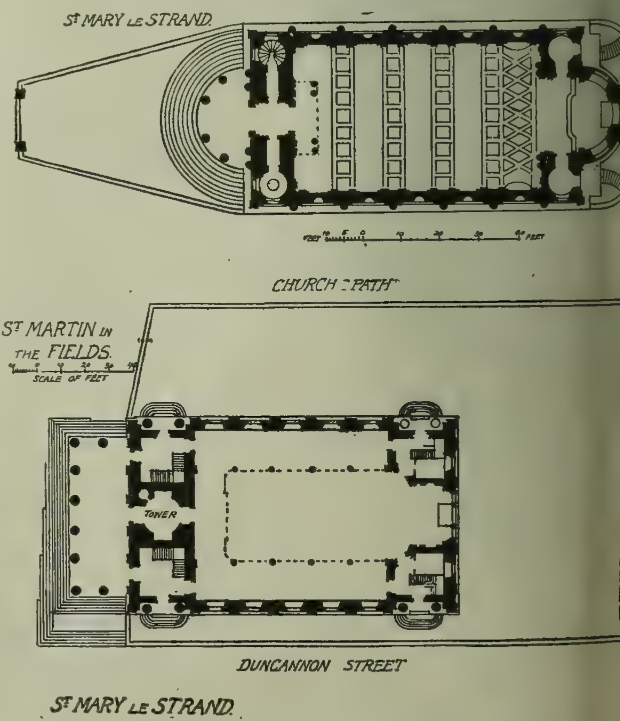
The Preservation of Stained Glass. SEVERAL letters have been written to the Press suggesting safeguards which should be adopted to protect old stained-glass windows from the risks of war. A correspondent in a letter to the *Daily News* recalls a very simple method adopted during the Siege of Paris—that of pasting strips of paper across the glass to save it from the dangers of concussion. This is undoubtedly an excellent and easily applied safeguard which should not be neglected. Other writers have advocated the fixing of boarded screens a few feet in front of the windows, which undoubtedly would form a good protection. Naturally, where glass is of great value and the expense justified, the removal of it to a position of safety is better than anything else; but it is suggested that in such cases a tracing should be made of every panel so that any piece of glass which becomes detached could be refixed in its original place. But, though it is wise to take precautions, we hope they may not prove to be necessary.

One-Man Businesses and Compulsory Service. A FIRM of company registration agents call attention to the many cases of personal hardship which are caused by calling up men who conduct their own businesses for military services. It is pointed out that it will be frequently easy to save the situation by converting the business into a limited liability company in which the vendor will take a number of fully-paid-up shares and become a director, practically retaining the business in his own hands; while he will be relieved from considerable anxiety by the knowledge that he will not be personally responsible for the company's debts, and in a number of smaller cases the wife of the proprietor will be able to carry on the business. While many can no doubt obtain relief by the methods suggested, the times are not favourable for the formation of companies, limited or otherwise, and we are afraid that architects will not be able to escape their difficulties by the means suggested, though it is possible that the formation of partnerships might help a few of those whose position is affected.

Butchers' Shops and Monumental Masons. WE have often heard it said that in the interests of art and of beauty the butcher should be obliged to display the carcasses he sells in a closed yard, and certainly no effort on the part of the architect can disguise the unsightliness of a beautiful display of prime joints, and whether such displays are "home-grown products" or New Zealand or Argentine importations they are equally distressing to eye and æsthetic sense. But with the same measure with which we judge and condemn such displays we must judge and condemn the appalling and dispiriting exhibitions of the monumental mason's art which so constantly meet the eye. The idea of death, so solemn and often so beautiful, is vulgarised by the coarse pretentious collection of ill-designed memorials—the broken crosses, pretentious urns, and other reminders of the stock-in-trade of the monumental mason. They are extravagant, for they have not the justification of beauty; the ready-made inscriptions and meaningless symbolism savour more of bathos than pathos, and all the time we have in every old churchyard perfect models to guide us if we need guidance. Our forefathers looked on death as the natural release from life, a thing to be commemorated fittingly, but not to be unduly grieved over; and the spirit of a former age made possible such epithets as that written above Vanbrugh's grave—"Lie heavy on him, Earth, for he Laid many a grievous weight on thee"—while the memory of the greatest of our English architects inspired the immortal words "Si monumentum requiris, circumspice."

The New English Art Club. THE fifty-fifth exhibition of the New English Art Club is an exceptionally good one, much of the work exhibited being remarkable for its freshness and vigour, while there is a smaller amount of eccentric work than usual. Mr. Augustus John is seen at his best in his portrait of Mr. H. A. Barker (No. 32) and a very fine decorative study entitled "The Lady by the Lake" (No. 36), and Mr. David Muirhead in his study of a girl at a window (No. 14 girl at a mirror (No. 16). Mr. Ambrose McEvoy's portraits are in with life, charm, and a delightful appreciation of colour. Mr. Wi Orpen exhibits two large paintings, "A Man from the Arran Isla (No. 3) and the "Holy Well, Ireland" (No. 22), which show power of striking composition and decorative effect. Alth somewhat mannered, the two decorative pictures of Mr. En Mooney (Nos. 232 and 234) are very charming and fresh in e The exhibition is full of good things, the Black-and-White R as usual, being very interesting. Mr. Francis Dodd sends a etching of St. Mary-le-Strand (No. 52), in which he shows arch tural knowledge and mastery of chiaroscuro. Mr. Muirhead and Mr. C. Marisco Pearse contribute excellent renderings of a tectural subjects. The exhibition as a whole is better anything we have seen for a long time.

The "British Architect." WE are glad to welcome our contemporary *British Architect* in its new form of a mo magazine, for it has throughout its history r tained a high professional and artistic stan Its criticism has never been ill-natured, and it has always exte quick recognition to merit apart from position. It has helpe encourage many at the difficult moment when recognition do much for the youthful aspirant to fame; while its editor, Mr. R Davison, is among the most deservedly respected and most po of architectural critics. It has been the free lance of architec journalism, but has never allowed controversy to become embitt Its first number as a monthly publication contains an exce article on the subject of Charing Cross Bridge and a pleasing by Mr. Voysey on "Fashion in Architecture," which, needless to he condemns. We hope our contemporary will have a long successful career in its new form, for it has filled in the past a u place which has not been covered by any other architectural jou and, if it has occasionally ploughed a lonely furrow, its e has shown judgment in selecting a beautiful field. In these da revived academical thought it is well to have the freer critici those who judge by results apart from the methods of which are the outcome.



Wren's Churches. (*See page* 397.)

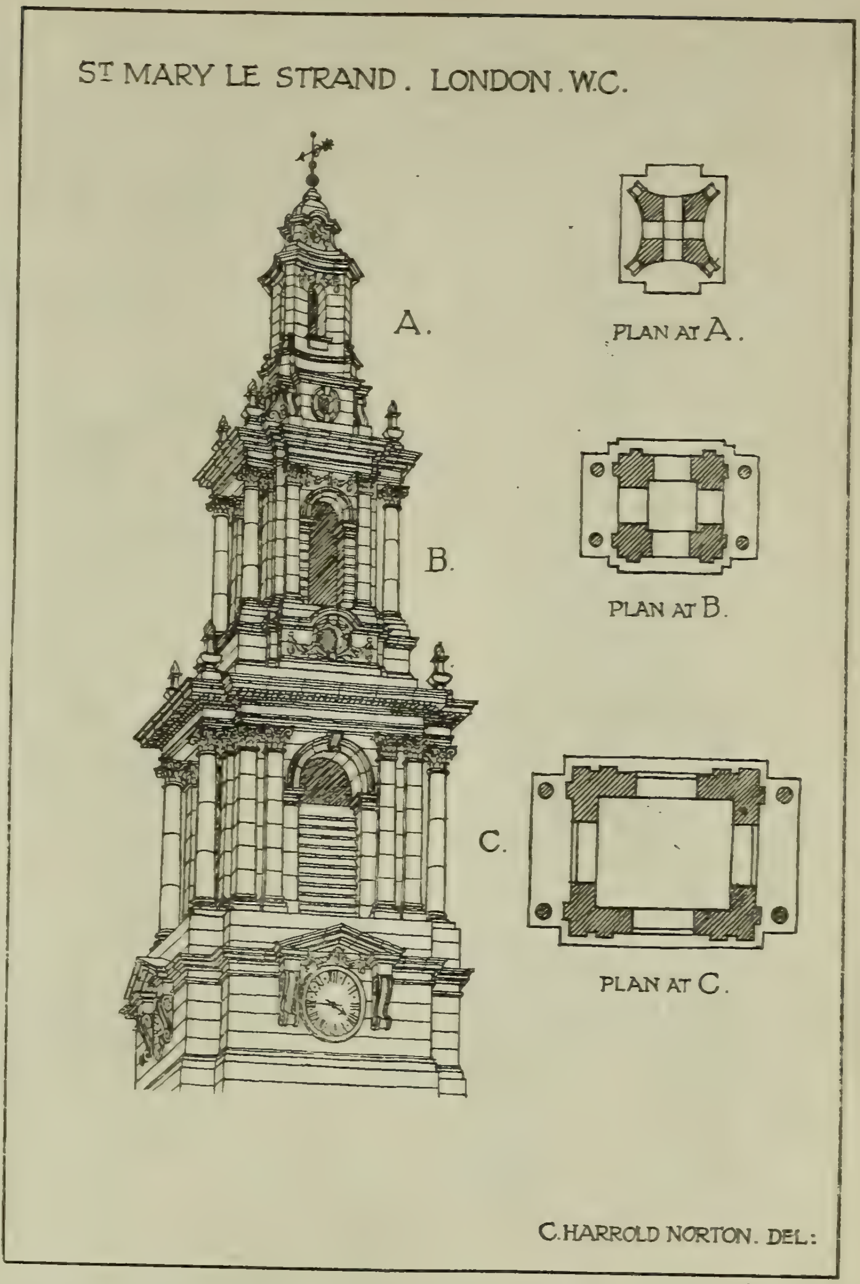
(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

HE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

. XXXVI.—St. Mary-le-Strand and St. Martin-in-the-Fields.

JAMES GIBB was the architect of three urches in London—St. Mary-le-Strand, Martin-in-the-Fields, and Marylebone apel—and also of the church of All Hallows Derby. St. Mary-le-Strand was erected the reign of Anne, being designed by Gibb er a tour in Italy, and the Commissioners building fifty additional churches (of which forms one) "spar'd no cost to beautify it." is externally a two-storied building, the er story unwindowed, "to keep out the ses from the street," the upper being pierced windows of which alternate lights are mounted by pediments suggesting a *tif* sometimes employed by Michelangelo. iginally there was to have been a small l turret, and at a distance of 80 ft. from west front a column 250 ft. high, surmounted a statue of the Queen, but on her death erection was abandoned. As the building s 20 ft. above the ground, and the abandonnt of the column suggested the necessity a steeple, the feature was added, but, in nsequence of the position of the walls, had be oblong in form, a difficulty which has en very skilfully surmounted by the architect. ob made other plans for the church which re abandoned, because they exceeded the site owed by Act of Parliament. The interior refined, but slightly wanting in interest; shallow elliptical ceiling is carried out in aly-decorated plaster ribs.

The old church of St. Martin-in-the-Fields ng in danger of falling, the parishioners ained an Act of Parliament for rebuilding at their own charge, and the Commissioners pointed Gibb surveyor. He made several igns for the new church, including the very eresting circular ones which are illustrated his book, but were abandoned for reasons cost. The first stone of St. Martin's Church s laid in the year 1721, and it was completed years later at a cost of £32,000. The ing is elliptical, a form preferred by the hitect "to be better for the voice than the nicircular, though not so beautiful." The ster-work of the ceilings was the work the Italians Arteri and Bagueri, who are cribed as "the best fret-workers who ever ne to England." In these two churches the erence between the work of Wren and his cessors is marked. The plans are far more urately symmetrical, but the work of Gibb, ough of much merit, is wanting in the rm and interest which distinguish the k of his great predecessor, while less mastery the combination of form and outline is wn.



◆

THE URVEYORS' INSTITUTION.

HE forty-eighth annual general meeting the Surveyors' Institution was held on 29 at No. 12, Great George-street, Westster, S.W., Mr. John Henry Hanson in the r.

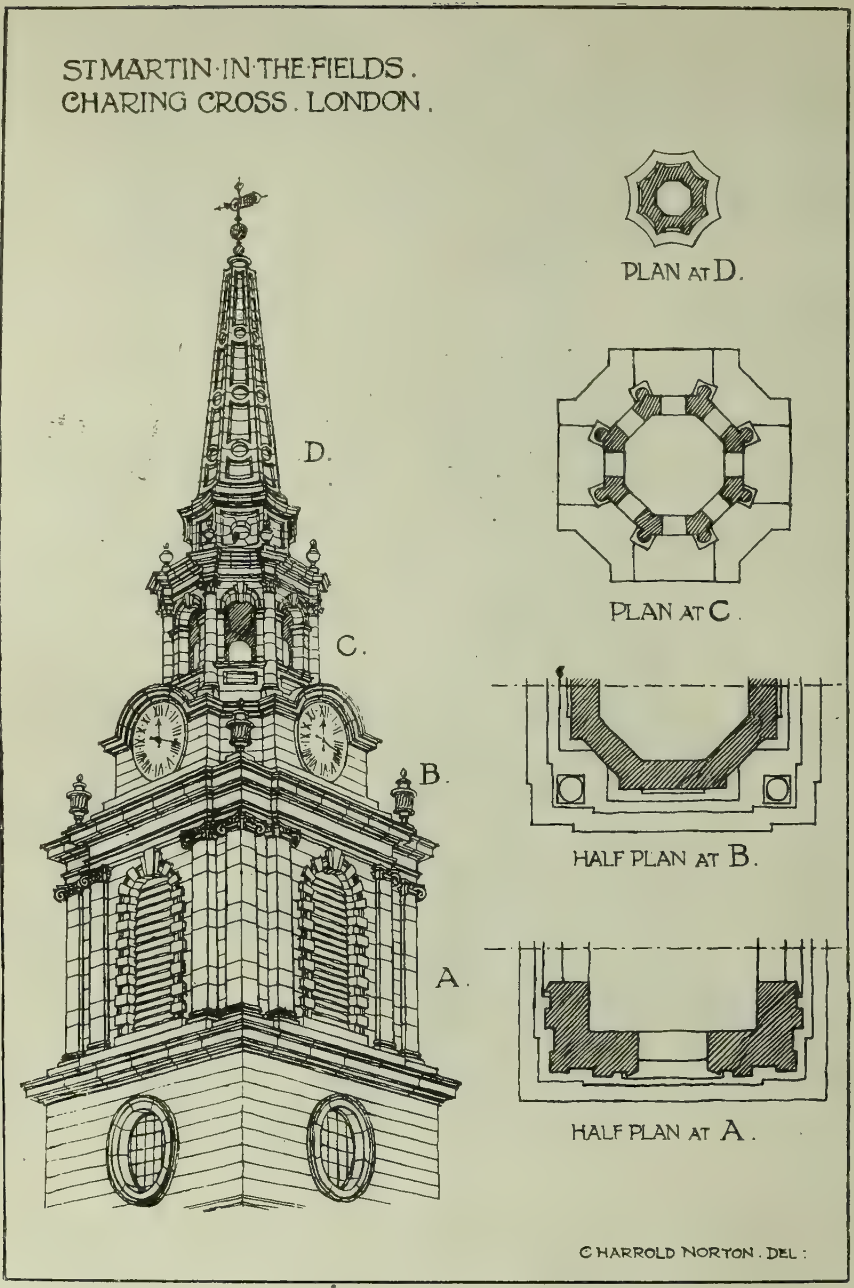
he Report of the Council and the balancet were received and adopted. From the ort we take the following:—

The statistics of membership again show a iderable fall in every class except that of nial Fellows, but of that fall more than half tributable to a decrease of 119 in the number udents, the supply of whom is practically off by the calls of military service. The might be said of Professional Associates, number sixty-nine less than twelve months Although a considerable number of men passed the Intermediate Examination, war has prevented so many of them from ng for the Final that the source from which balloting list is mainly recruited in normal s has therefore now practically been d. In this connection it is interesting to that the balloting list of October, 1913, ained the names of thirty candidates for the Fellowship and Colonial Fellowship, one for the Associateship, and 452 for the Professional Associateship, while the numbers in October, 1915, were respectively thirty, none, and fifty-five. The class of Probationers, recently formed from among those who, having passed the Intermediate Examination, wish to connect themselves with the Institution until they have passed the Final and come up for election, show a slight increase of from forty-nine a year ago to sixty-two at the present time.

As was inevitable in the circumstances, the Statement of Account shows that considerable changes have taken place during the year, but the Council feel that members are to be congratulated upon the manner in which the Institution finances have stood the strain of the war. In spite of the great depletion of income due to the fact that members on naval or military service are not asked to continue their subscriptions during their absence from professional life, it has been found possible again to carry on the year's work without making any call upon capital, the decrease in revenue being met to a great extent by economy in expenditure. The decline in the receipts from annual subscriptions amounted to £1,610 and from entrance fees to £140. It has been, however, in connection with the Examinations that the most marked loss has been manifested. During the few years prior to the war the large number of candidates presenting themselves for examination led to balances in examination fees over expenditure becoming available for the increase of the Scholarship Endowment Fund. These dropped to £95 in 1914, the first year of the war, while for 1915 the Examination Account showed a deficit of £600, in spite of a reduction by a similar sum of the expenditure under this head.

By suspending the offer of new scholarships during the period of the war, by the discontinuance for the time being of the country meeting and the annual dinner and reception, together with the consequent reduction in the cost of printing and postage, and by other retrenchments, distributed under almost every heading, a total decrease of expenditure compared with 1914 amounting to about £2,200 has been effected. In these circumstances the Council have been able to respond to the national call by taking up £1,000 of the Second War Loan.

The calls of the war were very evident in the number of candidates who presented themselves for the Preliminary and Professional Examinations during the current year. There were forty-four candidates only for the Preliminary Examination, the smallest number since 1883, the third year in which the examination was held; while we have to look back to 1892 to find a lower total than 139, the number who this year sat for the Professional Examinations.



Wren's Churches. (*See page* 397.)

By the death of Mr. A. W. Mellersh the Institution benefited by a legacy of £100, the proceeds of which were to be devoted to a prize for the encouragement of forestry. The Daniel Watney Prizes being already available for this purpose in connection with the Special Diploma Examination, the Council decided to allot this prize to the candidate doing best in the Outdoor Forestry Examination, Final Division.

The Council have decided to suspend during the period of the war the offer of Institution scholarships tenable at the Universities. They have been influenced in arriving at this decision by the fact that the call to military service not only had the effect of reducing the number of candidates desirous of competing, but, what was perhaps more important, in the absence on service of the best, of lowering the average standard of those who applied. This was perhaps to be expected, but in the circumstances the Council considered that the objects for which the scholarships were established would not be attained during the present interruption of university studies.

During the period of the war the *Professional Notes* will be issued every four months instead of quarterly. The Notes and Queries will continue to be dealt with expeditiously in the usual manner, and the Council feel, therefore, that this war economy may be adopted with no serious inconvenience to members. Expenditure on the Library and Forestry Museum has been reduced to a minimum. The former, however, is kept up to date by the purchase of new works of special interest to the profession, and new editions of previous issues as they are published.

The Council have little of special interest to announce with regard to the work of the majority of the committees. The Parliamentary Bills and General Purposes Committee, however, have had a considerable amount of work thrown upon them in connection with the war, such as the Increase of Rent and Mortgage Interest (War Restrictions) Bill, the proposals in connection with which they considered in their earliest stages, reporting thereon through the Council to the President of the Local Government Board. While that measure has been subjected to a considerable amount of criticism as economically unsound, it should not be overlooked that it was passed to meet certain abnormal conditions which had arisen; and that Mr. Long, in introducing the Bill, specially disclaimed any suggestion that the proposals were logical or that they could be defended on economic grounds. They have also been engaged in considering the appointment of arbitrators under the Housing Acts; the effect of Lord Derby's recruiting scheme and the Military Service Acts on the profession; the
manner in which the depletion of office s
could best be made good; and the effect of
excess profits duty on surveyors' earnings.

Twelve months ago the number of t
connected with the Institution who had jo
his Majesty's forces was 1,063, of whom twe
nine had given their lives in their count
cause. Those figures must now be incre
to 1,757 and sixty respectively. Of the fo
figure 197 are Fellows, 1,002 Professi
Associates, seven Associates, ten Col
Fellows, and 481 probationers, students,
examination candidates. Eight member
the Institution staff are also serving.

A circular was issued warning members
the War Risks Insurance Committee exa
very closely claims for compensation in res
of damage to property by hostile aircraft u
the Government scheme, and do not ac
liability for professional fees in respect
reinstatement, or for the cost of rene
boundary walls, paving, etc., unless spec
mentioned in the policy. In the circumsta
members were advised to see that the na
of the property and the risks which it
desired to cover were precisely defined;
it was pointed out that where the insura
were effected by reference to existing fire pol
this might be done by endorsement thereo

In view of the possibility of unemployn
arising at the termination of the war, and
necessity of taking steps beforehand to m
it, the Council have set up a committee divi
into two parts, representing respectively t
and country conditions, with the follov
reference:—

To consider the problems likely to aris
the termination of the war, more particul
in connection with possible unemploym
on the disbandment of the Army and muni
workers; and dealing with the quest
involved in the light of the special knowle
possessed by surveyors as distinct from o
professional men or from representatives
trade and industry, to suggest preventive
curative schemes. These committees are
sitting, and it is hoped that valuable res
may be obtained from their deliberations.

Among other subjects dealt with during
year have been town planning, in connec
with which a circular was sent out jointly
the Institution of Municipal and Cou
Engineers, urging surveyors representing l
authorities and those in private practice
co-operate in order to secure agreement in
earliest stages of the preparation of to
planning schemes; and in connection
which, also, the Council have joined with
Royal Institute of British Architects to imp
upon the Government and other authori
the urgent need which exists for defi
without delay the lines of main arterial road

The Council also have had under conside
tion the appointment of arbitrators under
Housing Acts, and have laid before the Lo
Government Board the advantages, from
point of view of economy, promptitude,
certitude of judgment, of employing
arbitrators men with a professional knowle
of the matters with which they have to dea

Mr. Howard Martin was nominated
represent the Institution on the Tribu
of Appeal under sect. 28 of the London Build
Act, 1890, in place of the late Mr. Herb
Thomas Steward."

Votes of thanks were passed to the vari
officers of the Institution for their services,
a vote of thanks was passed to the retir
President (Mr. John Henry Hanson).

Mr. George Francis Stewart was elec
President for the ensuing year. The V
Presidents for the year were elected as follows
Messrs. Arthur Lyon Ryde, John Hub
Oakley, Andrew Young, and John Willmot

Ordinary Members of Council.—Sir Rob
James Thompson, Messrs. Joseph Henry Sal
John McClare Clark, James Inglis Davids
Edwin Savill, Edmund Walter Rushwo
John David Wallis, Dendy Watney, Geo
Corderoy, Ernest A. Rawlence, Herbert Ma
field Cobb, Edward Samuel Cox, Bern
Marr Johnson, Ernest Holtham Leeder, He
Hartley, and Chas. Herbert Bedells.

As Professional Associates of Counci
Messrs. Stanley Hicks and John Maughan.

As Associates of Council.—Sir John W
Barry, K.C.B., and Mr. G. Mallows Freeman, K

CORRESPONDENCE.

The Commercial Value of Design.

Sir,—The excellent leading article in your ıe of May 19 raises questions which have zzled the plain man since first he began to nder whether it is really in the nature of ngs that the fittings of his middle-class ıse must be ugly and vulgar. Producers all the things of common use have sinned, l none more stupidly than the builders' rchant; there is no lack of examples, but, ong those you mention, door furniture is ical of most. The few well-designed fittings this kind which are now to be bought have y been produced at the urgent demand of hitects, and very rarely at a price that mits of their use in cheap houses. The rdry embossed finger-plate with a "New " iris crawling over it, or with a feeble vesty of Adam detail, is sold by hundreds thousands, and so the manufacturer clings he belief that it is "what the public wants," getting that the public is wholly inarticulate l must needs suffer what he chooses to give sullen silence, having no remedy. Where ice enters into the matter it is simply a ice of the least among a perplexing array vils.

n other countries, where manufacturers less timid than in England, or, it may be, securely lulled by inherited prosperity, minent architects and designers have been ed in to help, with a success which has been great from the financial standpoint as from t of the improvement in general taste. It rue that the hack-designer at 30s. a week is aper than the expert who commands a sonable fee for his knowledge; but where article is produced by the hundred—often thousand—gross the initial cost of a good ign is negligible. Moreover, a designer really understands his job will generally e this cost over and over again because he design not merely "on paper" but with ue regard for economy of material and of cess.

n any case, it is safe to prophesy that the t manufacturer who has the courage to operate whole-heartedly with the trained st, whether in the matter of door-handles, -stoves, or any of the hundred-and-one ngs that go to the fitting-up of the modern se, will reap a reward which will surprise ody so much as himself.

leanwhile, our art students remain art dents in the worst sense of the word, for of contact with the realities of commercial duction, while the man of taste who cannot rd to have things made specially for him ds more and more to look abroad for such will offend neither his eye nor his purse.

Hamilton T. Smith,
Hon. Secretary,
Design and Industries Association.

Sir,—In your leading article of May 19 very truly observe "we have never underod that good design has a commercial ue which it is wise to recognise and that d art represents good business."

t is well that this point should be put ward and pressed home, even if it is rather niliating to have to confess that seemingly only effective way of endeavouring to attain far-reaching improvement in the general ndard of design is to appeal to the pockets he producers and the users.

Fitness for purpose does not seem to have herto had much effect, otherwise we should see everywhere so many unsuitable build- s fitted up throughout with quite as unsuit- e accessories. Such buildings and such ings as are well and suitably designed—and y are not few—are, after all, but drops in the ket and do not affect the situation taken as hole.

Although the fact that a building is really an and artistically attractive one does not, you remark, run up its price to the relatively rbitant figures that are given for old books, tures, etc.; still the craze for antiquity in shape or form is so strong that people l not only pay a relatively higher price a building because it is old, but will, in numerous instances, put up with inconveniences, many and constant, on this account rather than build structures suited to their needs and in which they would be really much more suitably and comfortably housed, and which they would be able to run more conveniently and economically in every way. In nine cases out of ten it is not that the artistic qualities are really appreciated, but that it is one of the fashions of the time. Witness the way in which old buildings, once they are acquired, are often sadly mauled about by the purchaser and the local builder and all or nearly all genuine interest obliterated, although they still remain in the eyes of their fond possessors "old buildings." The same remark applies to old fittings, such as panellings, fireplaces, etc. How often does one find interesting pieces of genuine old craftsman's work used in an entirely unsuitable way and placed in uncongenial surroundings!

Architects have done much to remedy this state of things where their advice has been asked and taken; but again such cases are comparatively few when one takes into account the total number. The fact is that we have to deal with a public, taken as a whole, which is entirely uneducated in artistic matters and follows a fashion blindly in these as in many other ways; and to educate the public we must begin by educating ourselves. How often do architects put into a secondary place the practical considerations of their problem, be it a large city building, a church, or a country house!

We are still tied by the shackles of the past, and "style" in the wrong sense has still far too much influence over us. We must learn to be much more honest and straightforward and direct. True, we have no tradition with us to-day and must get our inspiration from somewhere, but let it be our problem of the moment that inspires us and let the proper use of our materials influence the form of our design, and, if we do so, we should be able to get dignified buildings without having recourse to such subterfuges as, for example, applied "Orders" and overhanging entablatures, which often shut out valuable light and air.

All our fittings should be efficient and direct without affectation or unnecessary ornamentation. For instance, amongst other things, a firegrate should be schemed to give the maximum of heat with the minimum consumption of fuel and the minimum of attention and cleaning. Door and window fastenings should be easy to handle, efficient in action and not liable to get easily out of order. In electric light we have a medium of illumination which can be distributed with the greatest ease, and yet we find the tendency has been towards mass-grouping of lights and consequently wastefulness of power. Much has still to be done in the way of fittings that, while giving a sufficiency of light with the smallest amount of power, do not disturb the eye. The recent direction in the way of improvements has been to increase the lighting capacity of each lamp while reducing the consumption. What seems to be equally important is that we should have a lamp of moderate lighting capacity using a minimum of power. This would be a real commercial asset, for private lighting especially.

In the matter of small housing, the so-called "Garden City" movement, where wisely applied, is tending towards a simpler and more straightforward type of building, and the weekly wage-earning class seems to appreciate what has been done, especially where equivalent value for value is given. Witness the success of the co-partnership housing movement.

It ought not, as you say, to be the business of an architect to have to design all the small accessories of his building, and indeed he has seldom got the technical qualifications which would enable him to do so satisfactorily. Here, again, co-operation between craftsman and architect should make good and suitable accessories possible. Good results have indeed been produced under such co-operation in exceptional circumstances, but at a needless expenditure of time and energy. But these should not be the exception, and large manufacturers ought to be able to produce, under right influence, suitable accessories in good taste which would not look out of place in any straightforward modern building.

Nothing, however, of any permanent value can be accomplished without education all round in suitability for purpose: the architect in his design and materials, the builder and the craftsman in their respective mediums, the producers and the distributors in all the accessories which go to make a complete building, and the public, not least, in its appreciation of what is right and appropriate.

Robert W. S. Weir.

BOOKS.

The Chancel of English Churches. By Francis Bond, M.A. (Oxford University Press. 7s. 6d.)

Mr. Bond's books form a useful halfway house between books which appeal to the antiquarian and ecclesiologist and those which are primarily and more solely intended for the architect. He brings to his task great knowledge and the industry which alone can inspire the necessary research, without which such works are valueless, both as records and as works of reference. It is natural, as everyone has the defects of his qualities, that Mr. Bond should illustrate examples which would have been omitted in a purely architectural work, and that the defect that we have noticed in other of his books, the inclusion of many illustrations which are somewhat indifferent in quality, should be apparent here. The book contains 229 illustrations, chiefly half-tones, many of which are reproductions from very poor original photographs, whereas about half that number of really first-class illustrations would have been of greater value; but the temptation to a man of great erudition to illustrate all his points and to give readers the benefit of his research tends to overcome sound judgment and to detract from the value of the book as a work of art. The book is divided into ten chapters, which deal in detail with the altar, the reredos, the Lenten veil, the communion-table, the altar rails, the piscina and credence, the sedilia, the chantry, the sacrament house, the Easter sepulchre, and the squint, besides other matter contained in an appendix. The value of the book to an architect, and especially one whose work lies in an ecclesiastical direction, is largely as a reference volume from which he may extract authorities and precedents which are so necessary when dealing with questions affecting ritual in the design of a church; its value for the clergy rests on a similar basis. It will form a welcome addition to the library of the ecclesiologist, but it cannot be expected to be a work which will be useful to the student of design or for those whose interest lies in the broader fields of architectural thought. In a word, the author has added another volume to the great series of works of reference which he has already produced, works for which he has acquired a well-deserved reputation.

Practical Drawing. By E. G. Lutz. (London: B. T. Batsford. 6s. net.)

In considering this book we take it for granted that it is intended primarily as an aid to those using draughtsmanship for commercial purposes rather than the serious art student. As such it is an admirable little book, containing as it does a mass of information, suggestions, and clever ideas. The matter is clearly set out and well-illustrated with diagrams and sketches. The ground covered ranges from the earliest stages in beginning to draw to the human figure, and the various mediums—charcoal, water-colour, and pen and ink—are dealt with separately. Further chapters give most of the information required for this type of work in geometry, perspective, and composition, whilst drapery and costume designing are considered in a concise and useful manner. Here we should say that we cannot agree with the author that "sketching anyone clothed with fresh examples of the sartorial art requires just the knack, one might say, of drawing drapery well." On the contrary, no drawing of a figure, draped or clothed, can, we hold, give a satisfactory result unless it has been guided by a sure knowledge of the nude. But this is only a minor matter, and does not detract from the value of the book. A section is devoted to lettering, and a comprehensive chapter on materials brings this store of useful and practical information to a close.

GENERAL NEWS.

Future of Charing Cross.

On Wednesday last week Lord Bristol's Select Committee of the House of Lords passed the South-Eastern and Chatham Railway Company's Bill for the strengthening of the existing Charing Cross bridge. Evidence against the proposals had previously been heard. Sir Lionel Earle, Secretary to the Office of Works, said he thought the new proposals would make the bridge uglier, and he advocated delay. After the war there would be an enormous increase in traffic on that railway, with the probability in the near future of a Channel tunnel, and he thought they ought to take the wide view. He had always understood that the sale of the Charing Cross site would practically pay for a fine new station south of the river. That would leave the way open for a magnificent national war memorial—a really beautiful bridge for ordinary traffic across the river on the site of the existing bridge.

Architects and Military Service.

. The arrangements made by the Royal Institute of British Architects and the Queen's Westminster Rifles for the enlistment of members desiring to serve together have unfortunately had to be cancelled as the War Office has found it necessary to stop further recruiting for this regiment. Fresh arrangements have now been made with two other battalions in which members of the Royal Institute and other architects will be welcomed if they will come forward without loss of time. Anyone desirous of taking advantage of these arrangements should apply at once to Lieutenant and Quartermaster H. G. James, the 22nd Battalion (R.), King's Royal Rifles, Norfolk House, Laurence Pountney-hill, E.C.; or to Captain Briggs, 23rd County of London Battalion (T.), 27, St. John's-hill, Clapham Junction. Unattested men can enlist at once in either of these battalions, provided they are fit for general service and are up to the prescribed standards. Attested men should apply either to Captain Briggs or to Lieutenant James for a letter which will enable them to complete their attestation at their local recruiting centre, and to be transferred to the battalion which they wish to join.

The Institution of Municipal and County Engineers' Examinations.

We have received a copy of the revised Regulations and Syllabus for the examinations held by this Institution. The Testamur Examination of the Institution has been held since 1886, and, although the booklet has been brought up to date from time to time, it was felt that a complete revision would be of service. The alterations may be summarised as follows:—Candidates will now be admitted to the examination at the age of twenty-one instead of twenty-two; candidates will be required to have spent at least a year in the office of an engineer engaged in public work; by the elimination of a certain amount of overlapping and rearrangement it has been possible to reduce the number of papers by one, which, together with the addition of an extra day to the examination, has given an opportunity of instituting a practical examination. The practical examination will be supplementary to and not in substitution for the *viva voce* examination. It is hoped that examination of candidates on the actual site on which work is taking place will result in establishing a still higher standard of practicability and knowledge than has hitherto been obtained. In the booklet will be found particulars of the examination for the Certificate in Town Planning and in County and Highway Engineering. The former was recently established for the purpose of giving an opportunity for a qualification to be obtained in the principles and practice of town planning. The first examination was held in October, 1914, and the arrangements have proved very successful. The certificate in County and Highway Engineering is intended for those engineers who propose to devote themselves especially to the work indicated by the title, and special attention is given to roads, bridgework, etc.

"Harper's Magazine."

Harper's for May contains an interesting illustrated article entitled "Through the Juras by Motor," by Mr. Albert Bigelow Paine.

The Royal Sanitary Institute.

The Royal Sanitary Institute will hold a conference on Sanitary Administration under War Conditions on Friday and Saturday, June 9 and 10, at the Institute in Buckingham Palace-road.

Reconstruction of Dublin.

The Council of the Institution of Civil Engineers of Ireland, at a special meeting held on May 24, had under consideration the suggestions put forward by the Lord Mayor at a conference held at the Mansion House on May 16, that Parliamentary powers should be obtained to facilitate a scheme of restoration of Dublin. The following resolutions were passed:—(1) The Council approve of the proposal that Parliamentary powers be obtained; (2) that the Institution of Civil Engineers of Ireland should be represented upon any Committee or other body appointed to consider or deal with the same; (3) that in constituting the tribunals to deal with the property owners the services of Irish professional men having local knowledge should be availed of as far as possible.

Appliances for Extinguishing Fires Caused by Bombs.

A Committee was appointed a short time ago by the Secretary of State for the Home Department to conduct experiments to test the value of dry powder fire extinguishers as compared with water and other "first-aid" fire appliances, for extinguishing or effectively controlling fires, such as are likely to be caused by bombs. In their Report the Committee state that the conclusion to be derived from the experiments is that, while none of the agents employed could be said to have any material effect on the combustion of the bomb itself, there was a very marked general difference between those experiments in which water was used and those in which dry powder was applied. The spread of the fire caused by the bomb was greatly limited, and in some cases totally prevented by the application of water; whereas after the application of the dry powder the fire continued to burn, although at each application some temporary check to the fire was noted. The Committee are confident that by far the best extinguishing agent is a plentiful supply of water applied in the manner most convenient, and that the use of dry powder extinguishers is to be deprecated as not only giving a misleading sense of security, but being practically useless for extinguishing or effectively controlling fires likely to be caused by bombs.

Examination in the Principles of Teaching and School Management.

The Board of Education give notice that they will hold at approved centres on July 20 next at 10.30 a.m. to 1.30 p.m. an examination in the Principles of Teaching and School Management under the rules as to the issue of teaching certificates for teachers of art (Rules 109). The examination will be based upon the syllabus published in Appendix C to Rules 109, and will be open to persons who have satisfied the requirements of those rules. As regards paragraph 4 (*a*) of those rules, unless exempted under paragraph 4 (*b*), they must have already completed or will be completing on or before July 31, 1916, an approved course of training in the Principles and Practice of Teaching at an institution recognised by the Board for the purpose. A fee of 3s. 6d. will be charged to each candidate for this examination and must accompany the form of application. Applications to attend the examination must be sent through the Managers of the Institution on the prescribed form (792 T.) so as to reach the Secretary, Board of Education, Whitehall, London, S.W., not later than June 14 in the case of a candidate who may not have already furnished a medical certificate indicating his fitness for the work of a teacher, and not later than June 21 in the case of a candidate who has already furnished a satisfactory medical certificate.

"Municipal Engineering."

We are informed that the title of the *Sani*
Record and Municipal Engineering has b
changed to *Municipal Engineering and*
Sanitary Record.

as St. Stephen's Green is at present, until
work of building could be taken in hand."

RCHITECTURAL SOCIETIES.

rchitectural Association of Ireland : Rebuilding of Sackville-Street.

H. G. Leask, President, occupied the at the final meeting of the session 1915-16 e Architectural Association of Ireland, at the rooms, South Frederick-lane, n.

e annual Report mentioned that, despite difficulties, the work of the Association been carried on successfully during the n. The total number of members was 115, an increase of five over last session. ommittee had adopted a resolution to the that all members serving in his Majesty's should be exempt from payment of riptions for the current session; and, in view of the prevailing conditions consequent upon the war, it was decided that the officers and Committee should retain office during the coming session. It was also mentioned in the Report that twenty-one members were now on active service.

On the motion of Mr. Edwin Bradbury, seconded by Mr. Allberry, the Report was unanimously adopted.

The President, referring to the problem of rebuilding Sackville-street, said the deplorable destruction of property in that area had produced a unique opportunity for the construction on lines worthy of the dimensions of the street of stately and harmoniously designed buildings in place of the previously existing miscellaneous and characterless frontages. That this opportunity should be due to catastrophe was greatly to be regretted; but, architecturally speaking, the old frontages were no loss to the amenities of the city, and it was to be hoped that the schemes already in train for the harmonious treatment of the street would come to full fruition. It was not necessary to say that Dublin architects—proud of the older glories of the city in the Georgian period—were ready and keen to assist the authorities towards these desirable results. The President also announced in connection with the work of the Association that what they should be most proud of was the fact that 20 per cent. of the members of the Association were serving with the military forces of the Empire.

The following prizes were awarded:—Class design, Mr. Stephen S. Kelly; Institute prize, Mr. W. S. Keatinge; Vice-President's prize, Mr. Stephen S. Kelly; Downes' bronze medal and prize of 2 guineas, Mr. W. A. Dixon.

LEGAL SECTION.

TES ON CURRENT CASES.

Liability of Building Owners.

N the distraction of war-time the fact that the decision in the case of Crittall Manufacturing Company *v.* the London nty Council (reported in our Reports in l. at page 692), and which caused some ation at the time it was delivered, has been pproved by the Court of Appeal in the Hampton *v.* Glamorgan County Council 15] 84 L. J. (K.B.) 1506) may not have ived the attention which it deserves.

will be remembered that in Crittall's case rm of builders had contracted with the ncil for the erection of a school. The tract provided for subletting, and the builders e authorised to sublet certain ironwork. architect having invited a quotation from plaintiffs, specialists, the builders were cted to place the order with them. When plaintiffs had received two instalments in ment from the builders the latter stopped ment, having become insolvent. The plain- completed the contract after some corre- ndence with the Council, and were suing Council for the balance of the amount due their contract. The plaintiffs alleged that contract was made with the Council, but Council denied this, saying that the builders e not their agents and the plaintiffs, by pting two instalments from the builders, elected to treat them as their debtors.

r. Justice Channell, in the course of a long gment, held that even if under the contract builders were *primâ facie* the principals, as the contract was to provide something hich the Council got the benefit and which to become their property they were the principals.

this case it is to be observed it was the ders or contractors who became insolvent. it was the building owners who were held le on the above grounds.

efore considering the case in which this sion has been impugned we will refer to other case (Ramsden & Carr *v.* Chessum & s), a case which was carried to the House ords. There the plaintiffs were specialists he design and manufacture of ornamental alwork, and had supplied certain door- dles to be fitted in a cinematograph theatre ch the defendants, contractors, were erecting the owners of the theatre. The building ers went into liquidation, and the plaintiffs the contractors. In the court of first ance it was held that no sum had been ived by the contractors from the building ers in respect of these articles and that the itect had not acted as agents of the con- tors in ordering them, but as the goods been delivered to the defendants and used them there was an implied promise on their to pay for them. The Court of Appeal rsed this latter finding, but the House of ds restored it, holding that in the circum- nces the fact that the builders had used goods raised an implied promise to pay for m.

is somewhat remarkable that neither of above cases, which are of the greatest ortance to builders, are reported in the aw Reports," nor is the case to which we l now refer, Hampton *v.* Glamorgan County ncil, in which Crittall's case was dis- roved.

that case a builder had entered into a p sum contract to erect a school for the ndants in accordance with the specifications under the directions of the architect. The ification and the bill of quantities provided certain prime cost items for which provisional s were to be allowed. The architect, ing corresponded with a firm for the supply heating apparatus, directed the builder ccept his tender. The firm, the plaintiffs he action, proceeded with the work and had ed that a sum on account should be paid. architect refused to certify it to them, but it was paid them by the builder. Subsequently, the builders being unable to pay the balance, the plaintiffs sued the building owners and succeeded in the court below, but the Court of Appeal reversed this judgment and held that the contract was between the plaintiffs and the builders only, and that the defendants, the building owners, were not liable. The Court of Appeal in delivering their judgment disapproved of the decision in Crittall Manufacturing Company *v.* London County Council and also that in Young & Co. *v.* White ([1911] 76 J. P. 14).

In this latter case the plaintiffs were specialists in steelwork, and tendered to the architect for the execution of certain work on a building at that time knowing neither the names of the builders nor the building owners, as apparently at that date the building contract had not been signed. The contract, when signed, contained the usual clauses as to the employment of specialists and provisional sums. Subsequently the builders gave the order for the steelwork in accordance with the accepted tender. Shortly before the builders had completed their work under the contract the architect, at the plaintiffs' request, sent the builders a certificate and a cheque for £500, stating that £150 of this was part of the sum due to the plaintiffs. The builders went into liquidation, not having paid over the £150 to the plaintiffs, and the latter thereupon sued the building owners. The Court, following Crittall's case, gave judgment for the plaintiffs against the building owners.

We have not had access to the full reports of all these cases, and therefore do not discuss them in detail, as it appears sufficient to point out that Crittall's case seems to have introduced an innovation in the accepted principles of law governing this question, since in that case it seems to have been held that the mere acceptance of the work done by a specialist implied a contract to pay for it on the part of the building owner. Of course, in every case it is a matter determined by the contract which of the parties shall engage the specialist, and, subject to the contract, a question of fact to whom the specialist gave credit. In the form of contract sanctioned by the Royal Institute of British Architects it is clearly provided that specialists nominated, selected, or approved by the architect shall be sub-contractors employed by the contractor, and this is the ordinary practice. In cases, however, where the position is not exactly defined the conduct of the parties has to be regarded and inferences drawn as to between which of them the contract was in fact made. As we understand the cases the decisions in Crittall's case and in Young & Co. *v.* White, which followed it, introduced a novel doctrine that accepting the benefit of the work rendered the building owner liable as under an implied contract, and if this be so the decision of the Court of Appeal in Hampton *v.* Glamorgan County Council disapproving of these decisions has, so to speak, cleared the air and left the law as it was.

The decision of the House of Lords in Ramsden & Carr *v.* Chessum does not conflict with the decision of the Court of Appeal in Hampton's case, because it will be observed that in Ramsden's case the question was not whether the building owner was liable, he being the person insolvent, but whether the contractors were liable, and the acceptance and use of the goods by the contractors in the performance of their contract was held to imply a contract to pay for them.

In the correspondence which appeared in our pages after the decision in Crittall's case various suggestions were put forward as to how the position of the parties to a contract—the building owner, the contractor, and the specialist—was to be adjusted, and perhaps it was assumed too much that none of these parties were free agents, but were subject to the presumptions raised by the law where the absence of express contract requires such presumptions to be made in law. We are always impressing upon business men the fact that much litigation can be saved by the parties to any transaction entering into an express and clear contract, but the exigencies of business seem to prevent them from doing so, and they rely on custom or on some document drawn in a general form which in the end involves litigation. This is especially the case in charter-parties and building contracts, both of which give rise to more litigation than any other form of contract, and both of which have another peculiarity in common, that both the captain of the ship and the architect have to act in a dual capacity, thus raising complicated questions as to agency.

All questions such as are raised by the above decisions could be so dealt with by carefully expressed contracts as to avoid the necessity of litigation; but in addition to this the parties before entering into onerous contracts should take some steps to satisfy themselves of the pecuniary position of those to whom they intend to give credit. It must be admitted that some of the litigation of the above character has been due to an attempt to adapt the contract to the unforeseen and altered conditions brought about by the insolvency of one of the parties.

Builders' Liability to Persons on the Premises.

Under the above heading, in our issue for November 19 last, we gave a short summary of the law, showing the varying degrees of liability imposed on contractors towards persons visiting the premises according to whether such persons were trespassers, licensees, or invitees.

The case which suggested our observations was Elliott *v.* C. P. Roberts & Co., the facts of which case are set out in our Law Reports, November 12, and in the article we refer to. Our readers may have observed that this case has since been appealed (see our Law Reports, May 5), so we refer to it again in order to explain that, although the Court of Appeal have ordered a new trial as they disagreed with the conclusion the learned judge had arrived at in that case, this has in no way rendered the statement of the law contained in our article inaccurate. In the court below the jury had awarded the plaintiff £2,000 damages, but the learned judge had entered judgment for the defendants on the ground that the plaintiff was on the premises as a licensee only. It will be remembered that the defendants were a firm of builders under contract to erect some schools for the London County Council, and it was a term of the contract that facilities should be afforded for other tradesmen employed by the Council to come upon the premises. The plaintiff came upon the premises in this capacity, and whilst crossing a gangway of planks unfenced and unfixed at either end sustained personal injuries. The judge held him to be a licensee, and, as we showed, the position of a licensee is that he takes the premises in the condition he finds them in, but must not be exposed to hidden dangers. There were no hidden dangers, so the judge in the court below entered judgment for the defendants.

The Court of Appeal, however, have taken a different view of the plaintiff's position, holding him to be an invitee, and, as will be seen by reference to our former article, this raises other considerations. An invitee is entitled to expect that the occupier of the premises will have taken reasonable care to prevent the invitee from being exposed to risks from dangers which are within the knowledge of the occupier or should be known to him. The questions whether such reasonable care has been taken by the occupier and whether the invitee has been guilty of contributory negligence are questions for the jury, and hence it will be seen that a new trial was ordered, since when the Court of Appeal took a different view of the status of the injured man it was necessary to have the opinion of the jury on these facts.

The Court of Appeal seems to have intimated that, although the gangway in question did not constitute a hidden danger, it was of a character which might require inspection and adjustment, and there was evidence upon which the jury might have come to the conclusion that failure on the part of the defendants in this respect was the cause of the accident to the plaintiff. As the Court agreed neither with the evidence upon which the verdict of the jury had been given, nor with the judge's ruling in favour of the defendants, a new trial was ordered, but it may be noted that the Court intimated that if the question of a new trial had depended solely on the question raised by the defendants in one part of their cross appeal, as to the damages awarded being excessive, on this ground alone the Court would not have ordered a new trial.

The Lumsden Case.

We may draw our readers' attention to the letter of the Secretary of the Land Union which appeared in the *Times* on May 23 last, in which he sets out a letter from the Chancellor of the Exchequer in which it is stated that the Board of Inland Revenue have decided to allow the payment of increment value duty in cases affected by the judgment in Lumsden's case to remain in suspense, whether such duty became payable on an occasion before or after May 7, 1913, until Parliament has decided whether the legislation promised in connection with that case is to be retrospective or not.

LAW REPORTS.

Surveyor's Solus Awards: Case under the London Building Act.

In the Shoreditch County Court on May 18 his Honour Judge Cluer held that the prevailing custom of third surveyors, appointed in connection with awards under the London Building Act, of signing the award solus was illegal, as all such awards must be signed by at least two of the surveyors, or all the three if they agree, the one on each side and the third appointed to arbitrate between the two. The case came before the Court by way of an appeal, the appellant being Mr. David Morris, 98, Darenth-road, Stamford Hill, a builder, and Messrs. Clozenburg & Hopkins, Ltd., 3c, 36, Charing Cross-road, W., respondents, picture palace proprietors. He asked that a decision be reversed or modified in an award of April 10, 1916, under the London Building Act, 1894, 57 and 58 Vict., c. 213, and that it be declared null and void. He also asked for a declaration that it was not made by one surveyor appointed by the appellant and the respondent, or by three surveyors or two surveyors, as provided by sect. 91 of the London Building Act; and that the wall marked "C D" was not a party wall, but an external wall.

Mr. H. J. Turrell, barrister, appeared for the appellant, and Mr. Lincoln Reed was counsel for the respondent.

Mr. Turrell said Mr. Morris, the appellant, was the owner of a building agreement of a piece of land at the corner of Graham-road, Mare-street, Hackney, and the respondents, next to it, had a picture palace. In December, 1915, appellant wished to build on this land and employed a surveyor, a Mr. Pratt, who prepared a party structure notice under the London Building Act. Mr. Beard was the respondents' surveyor. He sent a plan which referred to a wall, but did not refer to the wall "C D"; they did not know it existed. Contract was made with a Mr. Freeman on February 1, and on the 7th he commenced to make excavations to build six lock-up shops. It was almost immediately discovered that the wall "C D" ran along what was supposed to have been a party wall. These two walls, therefore, were really externals, one belonging to the respondents and one to the L.C.C., who had granted the building agreement to the applicant. Then the respondents thought Mr. Morris was building where he ought not to, and an *ex parte* injunction was obtained from Mr. Justice Eve, the merits of the case to be tried later. The proposition, then, was that the wall "C D" was an external belonging to appellant. There was an undertaking that there should be no interference with walls "D, E, to G" until an award had been given by the surveyors. But there was no undertaking as to "C D" wall, he submitted, as it was treated as an external. Had it been a party wall it would have been dealt with. On April 10 Mr. Adams—and Mr. Adams alone—the third surveyor called in, published the award; but he submitted it was not one contemplated by the statute and not within the province of surveyors. He took upon himself to call "C D" a party wall, and he contended that there was no jurisdiction, as it was not included in the party wall notice. He went on in the award to say that "D E" was a party wall, as to which there was no dispute. He was really only asked to find when it would be convenient to start the work. After going on to other matters, Mr. Adams then dealt with costs. His Honour would doubtless know that an award under the London Building Act, such as this, unless appealed from, became conclusive in fourteen days, and he had therefore to come before his Honour. A matter that was of paramount importance was that the wall "C D" was called a party wall, in which case they had no right to have started building certainly until two months had expired.

Mr. Turrell went on to say that, as to the award itself, there was a technical point, but one of very greatest importance to all surveyors having to do with these awards, and this was that it was signed only by Mr. Percy Adams, the third surveyor, and he submitted that these references under the London Building Act were references to surveyors as arbitrators and not as umpires. If a single arbitrator, it would be published as such, but if the parties did not agree each party had a surveyor, and these two appointed a third, not as an umpire, but so that two out of three should publish an award. Sect. 91 of the London Building Act was quite clear on the point, as it said that, unless both parties concurred as to only one, then each party appointed a surveyor, and those two appointed a third. So that all or any two of them should settle the point in dispute. The parties appointed one each, and they appointed a third, but the award had to be by two out of the three to be legal. This was a very technical point, but a very serious one to surveyors under the London Building Act; these statutes should be strictly followed.

Mr. Reed said, in reply, that he did not agree there was any substance in the argument of his friend. The section of the Act, on the face of it, contemplated that where two were agreed, or the three, that the third should publish the award with one of the others; but he submitted that the language was clearly directory and not imperative, and therefore did not vitiate the award, as it had only been signed by the third. He was instructed, and believed it to be a fact, that it was a custom amongst the whole body of surveyors for the third to make his award solus. The third surveyor's fees were usually high, and it was in connection with that that the practice had grown up, and was commonly followed for the third to sign the award solus. Mr. Adams was appointed on January 3 by Mr. Pratt, the surveyor to the building owner, Mr. Beard being the surveyor to the adjoining owner. If his Honour looked at the matter with very technical eyes, he contended that he would agree that this was satisfactory compliance with the Act.

Judge Cluer: It rather contradicts your theory. It says if the parties don't agree with one surveyor, they can have one each, and they can appoint a third.

Mr. Reed: The effect in appointing the third is really getting back to the one, as the third is the decisive one in the matter.

Judge Cluer: Then it is an unanswerable point if it meant that. I will not agree to one, but you appoint two, and then the two tell you you must be satisfied with one, as we are going to appoint him as a third.

Mr. Reed: I say the language of the Act is satisfied by the two agents appointing one when the parties will not agree on one. That seems to have been the intention—not the intention, but the language—covered by Mr. Morris in the structure notice.

Judge Cluer: That does not give him power to elect a sole arbitrator, because he might not appoint a surveyor; he might call on a lawyer.

Mr. Reed: Then I say it need not bear the signature of two or three of them; the language is directory, not imperative. What is clearly in the minds of the framers of the Act is that when the parties did not agree a third should be called in to adjudicate.

Judge Cluer: It does not say so. Two would be sure to quarrel, but with three there must be a majority. Before any dispute has arisen the third is to be appointed in case disputes arise.

Mr. Reed: But does not the Legislatu mean that when the disputes arise he adju cates upon them? After all, the award c get no further virtue, because it bears t signature of two instead of one.

Judge Cluer: Neither does the decision justices; but there has to be two.

Mr. Reed: Those are my two main poin and then I say this is not an arbitration und the London Building Act at all.

Mr. Turrell: But what does it say in t award? The arbitrator starts his awa under the London Building Act.

Mr. Reed: I say it is not conclusive. Y have to look at the substance and not the for

Judge Cluer: If it is not an award by arbitrator under the London Building A what is it?

Mr. Reed: It may have been intended such, but it may have been an arbitration a matter entirely outside.

Judge Cluer: If this is not under the Lond Building Act, and it is under the Arbitrati Act, then I have no jurisdiction to deal wi it, and the appeal has to be dismissed, as cannot come before me. He says he makes in the matter of the London Building A and he recites quite properly the formalit he has gone through.

In giving judgment, Judge Cluer said: T first point is fatal. Mr. Adams has mistak his position. Instead of being one of three, has given this on his own account. He cou agree as to his own costs, but the surveyor to the party walls might disagree with hi He has taken the position of umpire, and t is wrong, and I must set aside the award. he takes on a job he must know what he to do. He takes the idea of umpire, and t is the general practice of surveyors. T sooner they alter it the better.

Mr. Reed: After proceedings had been tak in the High Court, and an undertaking been given not to interfere with the pa walls, on March 20 Mr. Pratt wrote: "T the next thing is to settle the party structur He sent along a drawing, and suggested t if any difference arose it was the practice call in a third surveyor. Mr. Pratt later wr that he was referring to a third surveyor, Adams, and it is then that the "C D" w is brought in. This action is because Pratt misconceived his duty, as he conside that he had to settle whether "C D" party wall instead of other matters. As Adams has been induced by both surveyors a measure to do this, I suggest no costs.

Judge Cluer: I can't see any grounds. has issued this award. If Messrs Beard Pratt don't know the law, and refer impro things to him, he as a third surveyor sho have told them what to do. I can't see the party who is successful should not have costs.

The appeal was then allowed, with costs.

NEW COMPANIES.

The undermentioned particulars of companies recently registered are taken f the Daily Register compiled by Messrs. Jor & Sons, Ltd., Company Registration Age Chancery-lane, W.C. :—

R. J. Johnson & Co., Ltd. (143,7 Registered May 9. To acquire and take as a going concern the business of R. J. John carried on by him at Worcester-place, Oxf as R. J. Johnson & Co., and to enter int agreement. To carry on business as tin and builders' merchants, builders, carr wharfingers, etc. Nominal capital, £9,00 9,000 £1 shares. Directors and subscri 1 share each.

Coerceo, Ltd. (143,834). Registered Ma To carry on business of manufacturers, mak suppliers, and importers, etc., and dealer aeroplanes, etc., and all descriptions of veh for aerial navigation, motor vehicles, cars, lorries, and conveyances and vehicles of kinds, engineers, builders, wood-workers gas, etc. Nominal capital, £20,000 in 20 £1 shares.

William Thornton & Sons, Ltd. (143, 38, Wellington-road, Toxeth Park, Liver Registered May 19. To acquire the busi now carried on at Liverpool and elsew under the style of William Thornton & and to enter into an agreement to carr business as builders and contractors, Nominal capital, £30,000 in 3,000 £10 Ordi shares.

THE BUILDING TRADE.

E DRYING AND CONSER- ATION OF TIMBER BY LECTRICITY.

CCORDING to a report in a Swiss technical building trade publication, *Hoch und Tiefhan*, a method of drying conserving timber by means of treatment electric current is being tried on the inent with success.

e effect of passing a strong electric current ugh freshly-cut timber causes a chemical ge producing rapid oxidation of certain s, combined with a physical change in the lose and its numerous derivatives which ers them better able to withstand the n of fungi, while increasing its suitability nechanical use; it also confers an aseptic ity to the sap elements remaining in the er.

e Nodon process, as it is called, is claimed so effective that in a few hours a thorough ation of the wood-sap takes place, a process h, in free air, would require several months; process reduces the hygroscopic tendency e wood so that it no longer readily absorbs ture. The process can be applied to timber with such success that in a few s a thorough seasoning takes place; in the like period similar timber untreated rocess will be hardly surface-dry.

certain amount of moisture helps to carry electric current through the timber so the process is best applied to timber in a too dry condition, in fact, as soon as ticable after felling. It can be applied he forests where the felling takes place, reducing transit weight. The electrical gy required is 3 to 6 kilowatts per cubic e.

Thompson & Sons, Skinner-lane, Leeds; Liverpool: John Williams, 70, Collingwood-street, Liverpool.

GENERAL BUILDING NEWS.

PRESBYTERIAN CHURCH, CARCROFT.

The first rural Presbyterian church to be founded in the new South Yorkshire coalfield was opened at Carcroft, near Doncaster, a few days ago. The new church is dedicated to St. Andrew. The plans were prepared by Mr. T. Brownlow Thompson, architect, of Hull, and the work of building was undertaken by Messrs. Quibell, Son, & Greenwood, Ltd., of Hull. The new church is cruciform in shape, and will accommodate well over 300 persons in addition to the choir. The building is of red stock bricks. The interior fittings are of pitch-pine. There are traceried windows filled with stained glass in both the north and south transepts and at the west end of the nave.

NEW CHURCH AND HUT, SCOTTON.

The Bishop of Ripon recently opened a new church which has been erected at Scotton Camp, near Richmond (Yorks), by the Diocesan Board for the use of the troops. The building is a design in half timber, with high, sloping roofs, and is capable of seating a congregation of 1,000. It was designed by Mr. H. S. Chorley. A new church hut has been erected a few yards away.

PREMISES, OLD KENT-ROAD.

Owing to the general expansion of business Messrs. J. Liversidge & Son, Ltd., 559-561, Old Kent-road, have considerably extended their motor body and wheel works. The extensions comprise machine, body, and rubber-tyring shops, and also large garage. The new works are constructed of fire-resisting material, and have been carried out by Messrs. Geo. Parker & Sons, 124, Sumner-road, Peckham, S.E., under the supervision of and to designs prepared by Mr. Geo. J. Clarke, architect and surveyor, 32, Bensham Manor-road, Thornton Heath, Surrey. The constructional steelwork (some 75 tons) was supplied by Messrs. Drew-Bear, Perks, & Co., Ltd., 110, Cannon-street, E.C., and the skylight glazing (some 5,600 ft.) by Messrs. Helliwell & Co., Ltd., 11, Victoria-street, S.W. The reinforced concrete roofs are laid on the architect's own system, and the average cost on the aggregate works out at 5⅛d. per foot cube.

TRADE NEWS.

Boyle's latest patent "air-pump" ventilators have been applied to the Ipswich Corporation's Tramway Department, Constantine-road, Ipswich.

Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester, are supplying their patent exhaust roof ventilators for factory now in course of erection.

A damp wall in the Mayor's house at Winchester having given considerable trouble to the Corporation, the chief sanitary inspector suggested a Pudloed cement rendering, and we understand that a permanently dry wall has been obtained.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

—	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Masons' La-bourers.	Brick-layers' La-bourers.	Plas-terers' La-bourers.

PROPOSED NEW BUILDIN AND OTHER WORKS.*

In these lists care is taken to ensure accuracy of the information given, but it occasionally happen that, owing to builc owners taking the responsibility of commenc work before plans are finally approved by local authorities, "proposed" works, at time of publication, have been actually c menced. Abbreviations:—T.C. for T Council; U.D.C. for Urban District Coun R.D.C. for Rural District Council; E.C. Education Committee; L.G.B. for L Government Board; B.G. for Board Guardians; L.C.C. for London County Coun B.C. for Borough Council; and P.C. for Pa Council.

Aberdeen.—The Plans Committee of the has approved of the following plans:—Store factory, Shuttle-lane, for Messrs. G. Molliso Sons, produce merchants, per Messrs. Wilso Walker, architects; workshop and extensio an existing one-storied building in conne with the King's Engineering Works, K street, for Messrs. John M. Henderson & engineers; alterations and additions in nection with the dwelling-house, No. 382, G Western-road, for Mr. William Hepburn, ve nary surgeon, per Mr. W. E. Gauld, archi additions and alterations in connection premises, Hutcheon-street, for the Aber Combworks Company, Ltd., per Mr. Willia Boice, engineer.

Batley.—A new warehouse is to be buil Messrs. Cook, Son, & Co., at Carr Mill, B Carr, according to plans passed by the B Corporation.

Bexhill.—The T.C. has had before it ten for painting shelters on Parade, Park Pavi etc., and these have been referred to the C man of the Highways Committee and Surveyor, with power to act.

Bridgwater.—At a recent meeting of Bridgwater R.D.C. the seal of the Council affixed to the agreement with the T.C. respec the scheme for the construction of a new roa Wembdon, the cost of which had been estim at £7,315.

Chapel-en-le-Frith.—At a recent meetin the R.D.C. plans were submitted showin probable position of the new school at Ch en-le-Frith.

Duns.—The T.C. has granted leave to Mr Scott, Duns, to rebuild a house situated a Castle-street. The plans submitted and appr showed a self-contained house in place of present tenements.

Edinburgh.—The plans for the Royal (Veterinary College, Edinburgh, have been pleted by the architect, Mr. D. M'Arthy. T.C. have given approval of a draft town- ning scheme, which is a tentative one, for area at Craigentinny, Restalrig, and Loch The area extends to 896 acres.

Foleshill.—At a recent meeting of Fole B.G. and R.D.C. a letter was received from superintendent of the Government hou scheme at Holbrooks with reference to the ments which the authorities are erecting. letter stated that the Government are pu up hutments for 10,000 girls, and also se hundred cottages in connection with Me White & Poppe's works.

Highgate.—The Prudential Company is ing an hostel at Highgate for its staf domestics.

Kensington.—The London and South-We Bank, Ltd., are proposing to carry out ce alterations to their branch bank, No. Ladbroke-grove.

London.—An effort is being made to co £1,800 for rebuilding the Church schools o Bartholomew the Great and providing a ground.

Mansfield.—The T.C. has approved plan Messrs. Wm. Hollins & Co., Ltd., for addit stories to Pleasley Vale Mills.

Narberth.—Plans passed by the R.D. New dwelling-house at Farmers' Arms, M clochog; new dwelling-house at the Penffordd; repairs and additions to Pe Llawhaden; and alterations to Ddol Llanycefn.

Owston.—At a recent meeting of the Donc R.D.C. it was reported that the Bullcroft Colliery Company propose to erect 300 hous the parish of Owston.

Penzance.—The B.G. has decided to r struct the workhouse laundry.

Reading.—At a recent meeting of the C.C. it was reported that estimates fo surfacing a portion of the sides of the Bath between Reading and Hungerford, and r structing the whole width of the road length of one and a quarter miles bet Hungerford and the county boundary, have forwarded to the Road Board, and altern estimates for resurfacing with tarmac and gr the granite sides of the main road between ing and Ascot have been prepared by the c Surveyor and forwarded to the Road Board

Tottenham.—Twenty new factories are erected at Tottenham.

Uruguay.—The *Diario Oficial* (Montevide April 8 publishes a Decree authorising the E tive Power to invest the sum of 19,000 (about £4,200 at current rate of exchange) i construction of a school building in the of San José.

First Premiated Design.

WN PLANNING COMPETITION, YORK.

HE competition for the town planning of suburbs of York, instituted in August last , has now been decided, and the result, h we have announced in a previous issue, s follows :—

irst premium, £100 (No. 7), Mr. R. Dann, wley, Sussex.
econd premium, £50 (No. 1), Mr. M. A. cey, Warrington.
hird premium, £25 (No. 11), Messrs. Noel ohen & H. O. Burroughs, Liverpool.
ighly commended (No. 12), Messrs. Allen, mpson, & Thorpe, London.

is remarkable that no local architect ed a place, and that the competition, ough an open one, did not attract more n fifteen competitors. This small response perhaps due to the fact that the conditions e the impression that a large amount of k and a considerable expenditure in the chase of Ordnance maps would be involved, which the premiums were rather disproportionate. It is likely, however, that the ueness of the conditions as to the appointnt of an assessor had a more deterrent effect . The profession would have had more fidence in the competition, and would have n more prepared to risk labour and expense, it been announced at the beginning that fessor Abercrombie would be asked to udicate. Owing to the small number of petitors and the abstention of many firms se prowess in this direction is acknowledged. winner has outpaced his competitors and n his premium without superhuman rt.

Ve gave, in our issue of September 10, 1915, olan of the ground to be dealt with. The as to be treated primarily were numbered 2. and 3, and the schemes were required to l "in broad outline" with (1) new main ds for developing building land and conting outlying districts where practicable; the provision of open spaces, recreation unds, residential areas, industrial zones, and sites for public buildings. These three areas lie upon the north and west of the city, but the districts stretching right round the other sides of the city were to be shown only on the small-scale plans, and the competitors' views might take a form no more detailed than "observations." The areas scheduled comprise 9,031 acres, and reach from the city's present extent to an average of about three miles from the Minster.

Before the competition the ground had been broken by the authorities, who indicated certain arterial roads, and a great circumferential road encircling the city, which were to be incorporated in the scheme, thus determining the initial and main lines of the whole development, the most difficult and hazardous part of the work.

York has taken its development seriously just in time. It is a city large enough to be able to look forward to considerable growth and industrial progress during the next thirty years, but not so large that it has already stultified its chance of a successful town-planning scheme by encircling itself with a belt of wretchedly-planned suburbs which crush the city and poison the country, the unfortunate experience of so many of our large towns. The charm of the city is romantic, and of the Middle Ages. It grew for centuries, of course, within the bounds of its own walls, and cramped itself together inside them when another town would have spread outwards. There is therefore no chance of the city being the focal point and the climax of a great scheme. It is like a closely-guarded museum with narrow winding aisles but enchanting exhibits, among which continual delights surprise one at every turn. That is how the cathedral comes upon one. Though there is some majesty in the exterior, the real stroke of grandeur is reserved for him who will enter the south door and take in the superb view across the transept. Then he has seen the best. Outside the walls there is the sense that the city in bursting its bonds revelled rather too riotously in its freedom; the next stage of development has been without much discretion. Then come the areas which are the subject of the competition, the line where the roads change on the plans from the matter-of-fact black-and-white of the Ordnance map to the glory of trees and grass borders in which the competitive chartographer delights. A glance at this transition area shows that the time was ripe.

The First Premiated Design.

No doubt can be entertained that the design placed first is the best submitted. The author avoids the mistake which many competitors make of regarding each area as a separate entity and planning a great civic centre for it. Development on such lines would be unnatural and very defective economically. It must be remembered that it is York which is to develop. This surrounding country, even if scheduled in three separate areas, will be utilised according to the outward growth of York. Local centres there must be, but they should be of reasonable dimensions and properly subordinated to the whole. This moderation is very well exhibited in the first design. There are enough local points with just enough vehemence in their architectural treatment to punctuate the scheme and make it intelligible and for the proper concentration of public buildings. The open spaces are planned with delightful variety, the public buildings well placed in relation to the vistas, and some effective views of the cathedral and of other outstanding buildings obtained down the axial lines. The roads are not rigidly geometrical. In fact, the plan gives a general impression of sinuous lines, and this elasticity enables the author to draw out his roads with great freedom and to bring them as he will and with fine *sforzando* into the squares or circuses at the strategic points. He thus avoids nasty and acute angles at his junctions, and the latter are the more effective because of the contrast of their symmetry with the freedom of the roads themselves. Mr. Dann also shows great discretion in the shaping of his building plots. There is usually an irresistible drift towards triangular spaces, with all the awkwardness which in practice they involve. The spaces in this scheme are roughly oblongs.

Mr. Dann's design shows more care than any of the others in the transition from the areas already built on to the new ones. In area No. 2, which lies beyond some hundreds of existing cottages, he assigns a very awkwardly shaped plot to a large recreation-ground which will be used by the juvenile population of these present streets. He is hardly tactful, however, in view of its probably uproarious use, in surrounding it by his new houses. A good opportunity for a factory area, close to a mass of railway sidings, is seized, and presently, passing down a main approach road, one is clear of the old streets, and Mr. Dann gets into his stride. He gives a good geometrical swing to this section, where he is unhampered by awkward levels or any features which would interfere with a formal lay-out. The approach leads to a circus and the great circuit road, cleverly worked into the plan as it passes through the area, and as far as the railway permits the section is properly linked up to the others. The fact that the main approach, stopped by the park at the circus, is resumed beyond it and eventually ends in another place, presses the suggestion that it might, with greater effectiveness, have been continued straight through the park. This would spoil a good closed vista, but the vista is closed again later on. The park would not really be divided, for this modification would work in a salutary manner against the too commonly accepted idea that a railed-in park is one thing and a road is another.

Area No. 3 presents difficulties in the way of straightforward treatment through being cut in two by the River Foss, with all the indefiniteness of its flood-sodden banks. Because of this there can be few bridges, and the limitations thus imposed hamper the scheme. Nor is Mr. Dann seen here at his best. The public buildings in this area are rather lamely placed; the good planning of the through routes is, however, maintained, especially in the eastern section leading to Area No. 1.

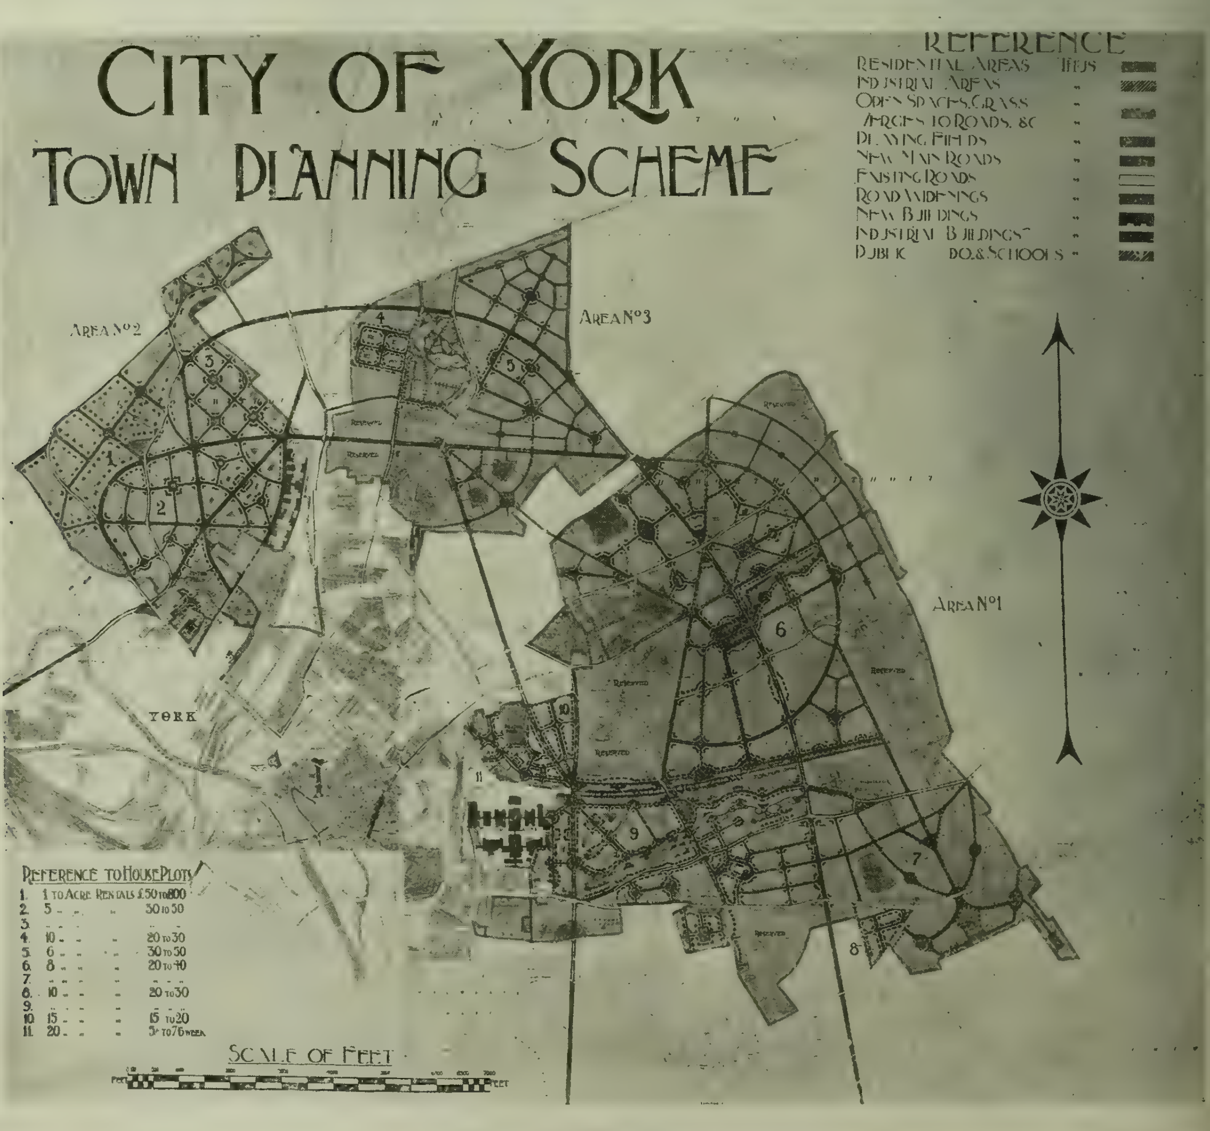
This area is large enough to lend itself to imaginative treatment, and, while it is nearly level, it occasionally breaks out into exciting eminences reaching from the 50 ft. to the 100 ft. contour line. It already contains three considerable roads radiating from the city, to which Mr. Dann adds two new ones, and widens others which are at present of small importance. It is crossed from east to west by a light railway, and the circumferential road strikes right through it. On this framework is built an eminently successful and striking scheme. The gradation from the city to the residential area is again skilfully managed by the disposition of the factories, mainly massed near the railways. A small industrial area where the light railway is crossed by an important road is a useful idea. It provides a small nucleus for a secondary industrial development, so that progress will not simply be in successive zones from the city. All to the good in this direction, too, is the author's tendency to throw his new centres well away from York, nearer to the outer than to the inner limits of the new area, and the provision of a small industrial centre right out to the west will be a chance for workmen's cottages at a good distance from the city. All the focal points are treated with freshness and dexterity and at well-calculated distances. Each is the centre of a small and not too rigid radial system, well related to its neighbours and to the main system of roads. The valley of the beck is well-treated.

Beyond the indication of the circuit road and a few useful, if obvious, linkings-up, author does not concern himself very de with suggestions as to the remaining area.

The Second Premiated Design.

The main point in which the second de differs from the first is that the encircling r are magnified somewhat at the expense of radial ones. The striking things are all on the circuit roads, along which one usu travels from one place to another, whereas treatment of the great roads to the cit comparatively undistinguished. The sch is a very sound one, and is immeasur superior to all others except No. 1. Comp with the latter, the placing of the pu buildings is not so convincing; there are many climaxes, and the author, after plan an excellent framework, is too apt to with the detail in bits, each bit emphatic so that the scheme is all small mark exclamation; the roads are continually burs out into circuses. And what would eventu work out to a monotony of excitemen depressing as a monotony of dullness (for sickens when cloyed with the one, and is m dully in sympathy with the other) is the that all these points of interest are so much a

This scheme only suggests what so n others enforce, that a larger aspect of planning on this scale is often ignored: th giving definite and individual expressio the planning and architectural treatmen different areas. This is achieved unconsci and through vicious reasons in the suburb our cities which were built long before the We have snobbishness, shabby gentility, posity, solid prosperity faithfully expre and we know by the look of their neighbour



Second Premiated Design.

he people who live at A have no dealings
hose at B, and for those in C to dine at
an epoch-making event productive of
s of social elevation entirely beyond the
those at D. But, whereas these mani-
ons of it are so evil, there is a hint of
ing good in the principle, and it is of the
ssence of natural development that, as
are going to be differences in these
ts round York, the town plan should
s them. And this is not done by merely
g a circle on all intersections of more
hree roads.

the rest, the second scheme is workman-
d thorough; there are some well-arranged
, the communication roads are well
d, and the industrial areas placed with
ion. The River Foss gives an opportunity
large park in Area 2, with an ambitious
tine aquatic treatment. This, however,
to be the only reason for a park at this
Great care is shown with the details
plan, and one improvement on the first
is that the author is not at a loss when
struck his keynote for a given section,
orks on to the very edge with the same
as that with which he plans the centre.

Third Premiated Design.

authors of the third design are more pre-
ed with the monumental aspects of their
than either the winner or the author of
cond design, and herein is largely the
e of their inferiority. They pay scant
on to detailed planning throughout;
ork with a big brush; they adroitly wipe
e awkward part of Area 2, for instance,
ark it off as an industrial area and say
re about it; in each section there is a
c *pièce de résistance* on far too grandiose

OBITUARY.

Mr. W. Leiper.

We regret to announce the death a few days since of Mr. William Leiper, of Glasgow, aged seventy-seven years. Mr. Leiper, a native of Glasgow, was educated at the High School of that city; he was articled to Messrs. Boucher & Cousland, and was afterwards an assistant of the late Mr. William White and of the late Mr. J. L. Pearson. He was elected a Fellow of the Royal Institute of British Architects in 1881, and served as a member of Council; he was elected A.R.S.A. in 1891 and R.S.A. in 1896; he was Honorary President of the (old) Glasgow Architectural Association in 1886 and 1894, and a Fellow, and in 1892–3 President, of the Glasgow Institute of Architects; he won the silver medal, Paris .Exhibition, 1890. Mr. Leiper was the architect of Dovanhill and Hyndland (Glasgow) churches, and St. James's United Free Church, Kilmalcolm, Renfrew; Messrs. Templeton's Factory, Kinloch Moidart; Kelly House (illustrated in the *Builder*, February 24, 1900), Knockderry Castle, Dumbartonshire, and Carndhu, Cornhill, Ballimore, and other mansions in Scotland; in Glasgow—Camp Hill Church, Sun Insurance Offices, French Renaissance in character, and the factories, after the Venetian style, on the Green; the Burgh Buildings for Dumbarton and Partick; U.P. Church, Skelmorlie; and "Red Tower," Helensburgh, for Mr. James Allan. He designed the decorations of the Imperial yacht *Livadia*; the organ-case for West Parish Church, Helensburgh; the scheme of decoration, including two mural paintings, of the Glasgow Municipal buildings; the Beacon Light, Duart Point, Mull, as a memorial of William Black, the novelist; and the Sandison Memorial Window, United Free Church, Arbroath. Mr. Leiper was appointed to the committee to adjudicate upon the competitive plans for the Glasgow International Exhibition, 1901, and was one of the architects invited to compete for the reconstruction of the Royal Infirmary, Glasgow, sixteen years ago.

Mr. R. A. Briggs.

In our last issue we announced the death of Mr. Robert Alexander Briggs, F.R.I.B.A. In January, 1910, he took into partnership Mr. Harry Le C. Browning, a former pupil of his, under the style of R. A. Briggs & Browning, of Amberley House, Norfolk-street, Strand, architects and surveyors; the dissolution of the firm was notified in the *London Gazette* of May 6, 1913. We illustrated his drawings of the Hôtel de Ville and the Church of Notre Dame, Dinant, in our numbers of January 31 and December 12, 1885, and his designs, as follows:—Three Cups Hotel, Colchester, competitive (August 15, 1885); for St. Paul's Church, Kensington (February 26, 1887); three bungalows on the Bellagio estate, East Grinstead (December 21, 1889, and April 19, 1890); dining-room and furniture, for Mr. H. Gosschalk (May 14, 1887); Cowley Manor, Gloucestershire, extensive additions, comprising eighteen new bedrooms, dining-room, billiard-room, conservatory and ball-room, sitting-room, kitchen offices, mahogany staircase, and interior decoration, mahogany panelling, etc. (December 12, 1902, with porch and piazza); house, Queen's-gate, London, S.W. (July 15, 1893); Darlington Municipal Buildings, competitive (March 16, 1895); house, Oxted (September 7, 1895); decorations and fittings in marble and ironwork, the chapel, Battenhall Mount, Worcester (May 2, 1890*); houses, Leamington (June 9, 1900, and November 19, 1904); restoration of the chapel in the north transept, and altar and reredos and screen, Jesus Chapel, and the bronze door, Worcester Cathedral (July 29, 1899); a house at Storrington (October 17, 1910); premises for Humber, Ltd., Nos. 60-4, Brompton-road, S.W., with residential flats above (July 30, 1910); a house, after the American "colonial" style (May 13, 1905); house, Johannesburg (September 16, 1905); No. 54, Kensington Park-road, W., for Mr. H. T. van Lawn (May 28, 1904), and additions to the Old Mill, Aldeburgh (September 10 and December 3, 1904). He was the architect of many country houses, amongst them being one at Farnborough for Colonel the Hon. J. Scott-Napier; Cranford House, and one for Mr. F. U. Spencer, at Leamington; at Crowborough Quarry Woods, and Marlow; Ewhurst, near Cranleigh; manor-house, Wormley; additions to Battenhall Mount, Worcester; Welwyn, Herts; for the equestrian memorial statue to Simon de Montfort, Evesham; Imperial Hotel, Hereford (in conjunction with Mr. G. H. Godsell); Royal Hotel, Cardiff; All Saints' Church, Pentonville; Queen Victoria Memorial, Liverpool, for which the first premium was awarded to him and Mr. B. Lindsay Clarke jointly; St. Saviour's Church, Sunbury; and St. John's Church, Macclesfield (in conjunction with Mr. Killmister). He made the designs for the new screen, altar, and reredos, Jesus College Chapel, Cambridge, and for the colour scheme of the reredos, St. Augustine's, Haggerston.

Mr. Briggs was the author of "Homes for the Country" (2nd edit. 1909), "Bungalows and Country Residences" (5th edit. 1901), and "Country Cottages and Homes" (1910), being collections of his designs and examples of his executed works; "The Essentials of a Country House," with seventy-one illustrations (1911); and "Pompeian Decorations," with three-colour process illustrations (1912). He was a liberal subscriber to the New Premises Fund. Architectural Association, and a member of Council Architects' Benevolent Society.

* Two views of the interior drawn by the late Mr. C. E. Mallows.

◆

THE LONDON COUNTY COUNCIL.

The fortnightly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. A. F. Buxton, Chairman, presiding.

Tabard-street Scheme.—In a report submitted by the Housing of the Working Classes Committee it was stated that the cost of carrying into effect the Tabard-street, Grotto-place, and Crosby-row scheme would be £273,000, a reduction of the approved estimate by £200,000. Various causes have contributed to the very favourable result. The value of property of the class dealt with has much depreciated in recent years. The result of the arbitration in the disputed cases was also satisfactory. Another important factor in the result is the settlement of two large claims which included substantial sums in respect of trade interests. Terms having been arranged by agreement in both these cases, one claim, amounting to £59,466, was settled by payment of a sum of £16,500, while the other claim of £500,000 was settled on a reinstatement basis, involving a payment by the Council of £578 15s. only for expenses. A saving was also effected by excluding St. Stephen's Vicarage from the scheme. The Committee recommended that the estimate of £473,000 approved in respect of the cost of carrying into effect the Tabard-street, Grotto-place, and Crosby-row scheme be reduced to £273,000.

London Statistics.—Volume XXV. of *London Statistics* has been completed and is about to be placed on sale.

Southern Outfall—New Engine House.—The Main Drainage Committee reported that the enlargement of the pumping-station at the Southern Outfall and the provision of additional pumping power have been completed. The contractors for the engine-house and the constructional work generally were Messrs. Dick, Kerr, & Co., Ltd.; for the engines, Messrs. Fullerton, Hodgart, & Barclay, Ltd.; for the pumps, Messrs. Boving & Co., Ltd.; and for the boilers, Messrs. Galloways, Ltd. The total cost of the work amounts to about £94,000.

◆

A YEAR'S BUILDING AT AYR.

At Ayr Dean of Guild Court recently the Surveyor (Mr. John Young) submitted statistics of plans passed at the Dean of Guild Court for the year ended May 15, 1916. Twenty-five warrants were granted, the total estimated cost being £18,303. For the previous year the amount was £42,673.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (✱) ar advertised in this number:** Competitions, —; Contracts, iv.; Public Appointments, —; Auction Sales, xx. Certai conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bin themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be mad for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willin to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while eve endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

June 5.—**Pontypridd and Pontlottyn.**—Police Courts.—The Standing Joint Committee of the Glamorgan Quarter Sessions and C.C. invites tenders for (1) the erection of a new police court, etc., at Pontypridd, (2) the erection of a new police court at Pontlottyn. Plans, etc., of work No. 1 may be seen and copies of the bill of quantities, etc., obtained at Pontypridd Police Station, and the plans, etc., of work No. 2 may be seen and copies of the bill of quantities, etc., obtained at the Police Station, Pontlottyn.

June 5.—**Wolverhampton.**—Painting, etc.—Painting and colouring at certain schools, for the E.C. Forms of tender, etc., of Mr. T. H. Fleeming, 10, Queen-square, Wolverhampton.

June 6.—**Ballinaloob.**—Residence.—For the erection of a residence at Ballinaloob for Mr. S. H. Wallace, Dunseverick. Plans, etc., from Mr. Robert Robinson, New Buildings, Ballymoney.

June 6.—**Bolton-on-Dearne.**—Painting, etc.—The West Riding E.C. invite tenders for painting and distempering at Bolton-on-Dearne Goldthorpe Council School, also for the painting of the caretaker's house. Specifications, etc., of Mr. W. H. Jones, Divisional Clerk, Education Offices, Mexborough.

June 6.—**Mexborough.**—Painting, etc.—The West Riding E.C. invite tenders for the painting and distempering in connection with the summer renovations at Mexborough Garden-street Council School. Specifications, etc., of Mr. W. H. Jones, Divisional Clerk, Education Offices, Mexborough.

June 6. — **Stanley.** — Brick Culvert. — For extending brick culvert at Hustle Down, Stanley, for the U.D.C. Plans, etc., at the Surveyor's Office, Stanley.

June 7.—**Luddendenfoot.**—Rebuilding.—For rebuilding mill, Luddendenfoot, S.O. Yorks, for Messrs. Joseph W. Whitworth, Ltd. Plans, etc., on application at the above offices.

June 7.—**Mullingar.**—New Wing.—For the erection of a new wing to the Presentation Convent, Mullingar. Plans and specifications can be seen at the Convent in Mullingar, or at the offices of Messrs. William H. Byrne & Son, architects, 20, Suffolk-street, Dublin. Quantities of Mr. Andrew B. Bruntz, 1, Charlemont-terrace, Kingstown. Deposit, £1 1s.

June 10. — **Gildersome.** — Rebuilding.—For masons', concreters', joiners', plumbers', plasterers', slaters', and ironfounders' work in rebuilding Maiden Mill, Gildersome, for Messrs. A. & A. Brooke. Plans, etc., of Mr. T. A. Buttery, Licentiate R.I.B.A., architect and surveyor, Queen-street, Morley, and 1, Basinghall-square, Leeds.

June 13.—**Cardiff.**—Painting.—The Corporation invite tenders for the following works, viz.:—Painting district police-stations, painting cab shelters, stripping and reslating main roof of the Cathays Police-station. Specifications, etc., of the City Engineer, City Hall, Cardiff.

June 13.—**Pendleton.**—Relaying Floors.—For relaying concrete and tile floors at the Hope Infirmary, Pendleton. Specification, etc., of Mr. E. H. Inchley, Clerk to the Guardians, Poor Law Offices, Eccles New-road, Salford.

June 14.—**Dartford.**—Painting, etc.—The Metropolitan Asylums Board invite tenders for external painting works and repairs at the Darenth Industrial Colony, near Dartford, Kent. Specification, etc., at the Office of the Board, Embankment, E.C. Mr. Duncombe Mann, Clerk to the Board.

✱ June 15.—**Potteries District.**—Repairs, etc.—The Commissioners of H.M. Works, etc., invite tenders for repairs, etc., to buildings in the above district.

June 19.—**Bristol.**—Painting, etc.—For the painting, colouring, etc., of certain schools for the E.C. Specifications, etc., from Mr. Peter Addie, Exchange, Corn-street, Bristol. Deposit, £1 1s.

June 19.—**Lanark.**—Painting.—The District Committee invite tenders for painter work of the undernoted bridges, namely:—(1) Clyde Bridge, near Motherwell; (2) Bothwell Bridge; (3) Cambuslang Bridge; (4) Prior Bridge, between Blantyre and Cambuslang; (5) Holm Forge Bridge, between Bellshill and Motherwell. Copies of the specification, etc., of Mr. Robert Spittal, Road Surveyor, District Offices, Hamilton.

No Date.—**Frodingham.**—Excavating, etc.—For Government work, comprising 15,000 cubic yds. of excavating and concreting required at Frodingham. Particulars from the Frodingham Iron and Steel Company, Ltd.

12,805 of 1915.—Frank Albert Stiers: Valves for street-sprinklers.

13,074 of 1915.—Rothwell Richard Grundy: Plugs and plug sockets of baths, troughs, and other like articles.

13,479 of 1915.—William Stratton Thomson: Gas pliers.

13,497 of 1915.—Nicolai Molotiloff: Detachable reinforced concrete flooring.

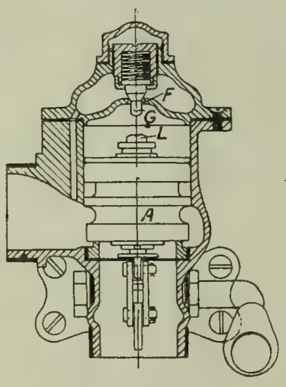
13,742 of 1915.—Gustav Schulz: Locks.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

SELECTED PATENTS.

21,586 of 1914.—Henry Lewis Doulton: Flushing valves.

This relates to flushing valves in which the port or waterway F, which controls the rate of inflow of water behind the control piston of a water-closet flushing valve A, and hence the rate of closing of the valve, is kept clean h a spring-depressed regulator or cleaning-pin which is reciprocated by the head L each tin the valve is used. The pin is formed with conical part, so that the waterway is enlarg each time the pin is lowered.



21,586 of 1914.

21,987 of 1914.—Sir Archibald Denny an Duncan Geddes Walker: Cement.

This relates to a quick-setting cement, havi an alkaline reaction, which is produced mixing substantially anhydrous gypsum wi 1 to 10 per cent. of Portland cement.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3827. JUNE 9, 1916.

COMPREHENSIVE STREET DESIGN.

THE architect, as well as the amateur who views this subject with disdain, has little sympathy for schemes of rebuilding projected to secure the amenities of cities. The matter is no longer one of controversy, for we have long since passed e stage when the body of opinion voted for individualistic eedom in design as opposed to well-regulated systems of nsistent architecture. Neither can it be put forward that e present crisis is inopportune for such theories to be mooted. ıe discipline of the war points the definite moral that a new ler of things must be conceived, and speedily, for with the ːurn of peace and the consequent influx of labour only drastic organisation can prevent a repetition of the chaos which for e past fifty years has disfigured the streets of London and the ies of the provinces. The destruction of Sackville-street, ıblin, shows how intimately the conflagration of Europe has fected a capital city well within our insular boundaries. ıere are other instances which will be referred to *in seriatim.* is just as simple for local authorities to frame certain gulations governing the height and material of street ontages as it is to regulate the thickness of walls and the servance of sanitary rules. This point could be carried rther, especially where existing frontages of 300 ft. are about be rebuilt. It will be argued that designs prepared by an chitect for a portion of such a frontage would not be accepted another called upon to complete the block, or that a ilding required for a warehouse could never be worked into portion of a composition in which the majority of premises ould be designed as offices. This theory is false, because it is ident that the conditions of city life have automatically gregated diverse interests into different quarters. There a shipping centre, where the offices of the shipping mpanies are found; a bankers' centre, such as Lombard-reet; shopping centres, similar to Cheapside, the Strand, egent-street, Bond-street; merchants' centres, like Moorgate-reet and the tributaries near Cheapside; manufacturers' ntres, like the ill-favoured Queen Victoria-street; and gineering thoroughfares akin to Victoria-street, Westminster. ıe foregoing list does not include every category; it alone tempts to point out the rough division ordained by the ıssing of years, as well as the necessity for certain industries be near the heart of the City and at the same time within sy communication the one with the other. In the City and e West-end there are several well-designed thoroughfares, anned during the early part of the nineteenth century, the fronting of which is becoming a matter for immediate nsideration. It is neither desirable nor possible to preserve e conventional stucco façades of these streets for all time, ıt surely it is within the scope of sound politics to ensure ıat these respectable buildings are replaced by others of ıproved interest, and that a street distinguished in the ıst for ordered regularity in architecture should, despite the ıssing fashion, retain some part of the tradition with which s use has been associated. The refronting of the north side Moorgate-street is shortly to be undertaken, and unless the ity Architect seriously considers the matter with the orporation, determining the height of cornices, insisting on gularity of sky-line, and the adoption of a uniform façade r the whole block, the aspect of this restful street will be ıanged for the worse.

In the first place, owing to the absence of a controlling ody to whom all designs can be referred, the first architect the scene, commissioned to treat a small portion of the ontage, has it in his power to make or mar the aspect of a reet. Now, it should be possible in such a case, without setting in motion the whole machinery for an architectural competition—competitions of this kind being notoriously unproductive of good designs—for the City authority to ask the architect first called in to treat a portion of an extensive block to submit a comprehensive design for the whole frontage. The City authorities would have the right to approve or censure the design, to call upon architects and artists of renown for an opinion on the merits or defects of the proposition, and they would then be in a position to judge, from elevational and perspective drawings, what the street would look like when completed. The interpretation of such an idea as the one suggested above would be broadened to meet different cases. A landlord owning three sites adjacent to one another would, when circumstances permitted, rebuild to the larger scale, care being taken to observe the height of the main cornice settled by the authorities and to complement the main lines of the adjoining buildings. Notwithstanding the desirability for control and co-ordination in this important question of street design, there are instances, particularly in London, where the individual interests are too opposed to be subjected to correlation. High Holborn and Oxford-street are cases in point. New Oxford-street was designed by Pennethorne into architectural blocks, and is happily outside the controversy.

London does not suffer from a poverty of interest; the chief fault is the ancient City is over-dressed. There is such a variety of picturesque attributes all clamouring at once for notice; such a plethora of advertisements, as well as a variety of coloured building materials to confuse and detract from the dignity a capital city should exhibit. We do not wish to see London a cheap imitation of Paris, but if our authorities could only be brought together to check bad taste and illiteracy in architectural design the beneficial effect on the community would be an advantage.

It is interesting to learn that the Irish Institute of Architects convened a meeting directly the rebellion was under control to go into the question of rebuilding Sackville-street, Dublin. A resolution was passed against the piecemeal reconstruction of the thoroughfare, and demands were made regarding a general scheme. There was only one dissentient in favour of each architect designing in his own sweet way. It is known that the Post Office can be restored, and this is the only building of value in the street. It is also well within the scope of the reconstruction to remove Nelson's Pillar to a new site at the head of the street, and not leave it in its present position, where it cuts off the north side of the city. There are many difficulties in the way of our Irish friends: cost, co-operation of the architects, party walls and boundaries, resentments and jealousies; but there is still a chance that something monumental can be achieved and the reputation of the famous street enhanced by reason of its new architecture. The future will witness a complete change of opinion regarding the *laissez faire* of civic bodies to the architectural amenities of cities. No longer will it be sufficient for City Fathers to boast of extravagant lighting, drainage, and tramway schemes if the conventional scenery of the city is left to take care of itself. Compared with the architectural triumphs of other lands England is sadly deficient, and, save for the glories of the past which adorn the metropolis, London itself is provincial to the core.

We do not intend to close this article in the key of a Jeremiad, for much good work has been done and is being done to rectify past errors. There remains, however, an urgent need for closer surveillance over the treatment of street façades and the restoration of conditions which will make it possible to once more follow the example of the great architects of the eighteenth century.

NOTES.

Charing Cross Bridge.

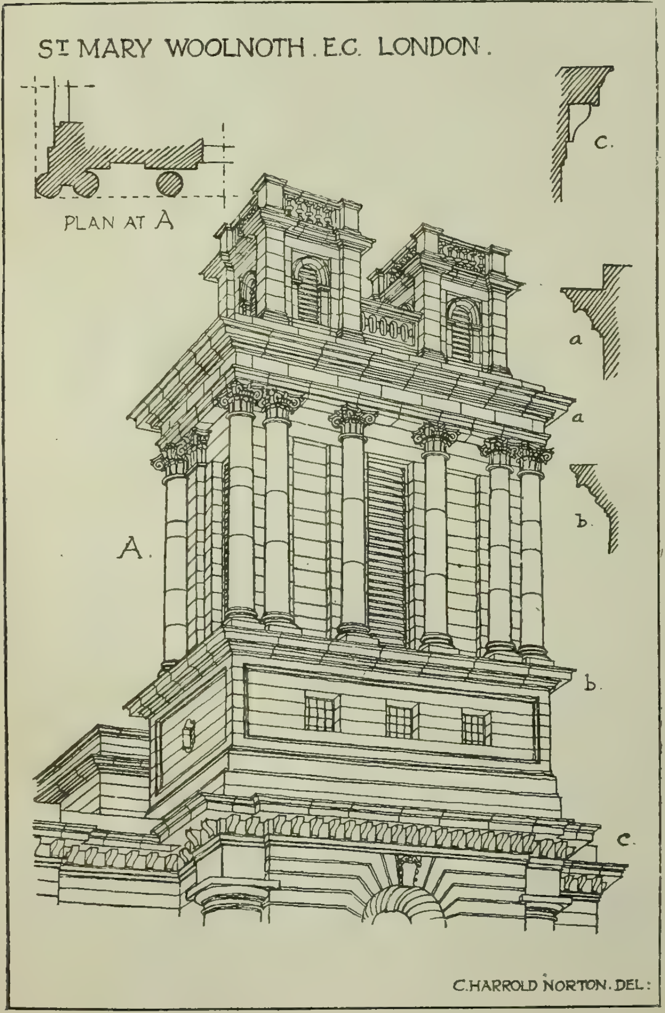
We are very glad that the South-Eastern Railway Company's Bill with respect to Charing Cross Bridge is meeting with such determined opposition, and are pleased that Sir Aston Webb has been able to give so much time and energy to the matter. The fact that he has done so should encourage the opponents of the measure, for Sir Aston wisely does not devote time to championing forlorn hopes, and thus giving the public an excuse for representing architects as unpractical visionaries. The proposals of the company are the outcome of the Philistine attitude adopted by many of the railways and other great corporations in this country, and have been brought forward at a most inopportune time when the country is engaged in the throes of a great war. If the South-Eastern Railway Company would show a little more energy in remodelling their train services and increasing their traffic facilities the public would have reason for gratitude. As it is, the want of better train services puts a barrier in the way of the development of one of the most beautiful counties in England, while for years their freights have been a bar to the increase of trade. They have five stations in London—Holborn Viaduct, Ludgate-hill, Cannon-street, London Bridge, and Charing Cross—which can hardly be considered a necessity, since other companies manage very well with one terminus. The proposal to remove Charing Cross to the southern side of the river and to make a great monumental footbridge to commemorate the present war is a proposal which wants full and impartial consideration after the war, and is not an unimportant side issue which ought to be pushed through when Parliament cannot give fitting and ample investigation to the subject.

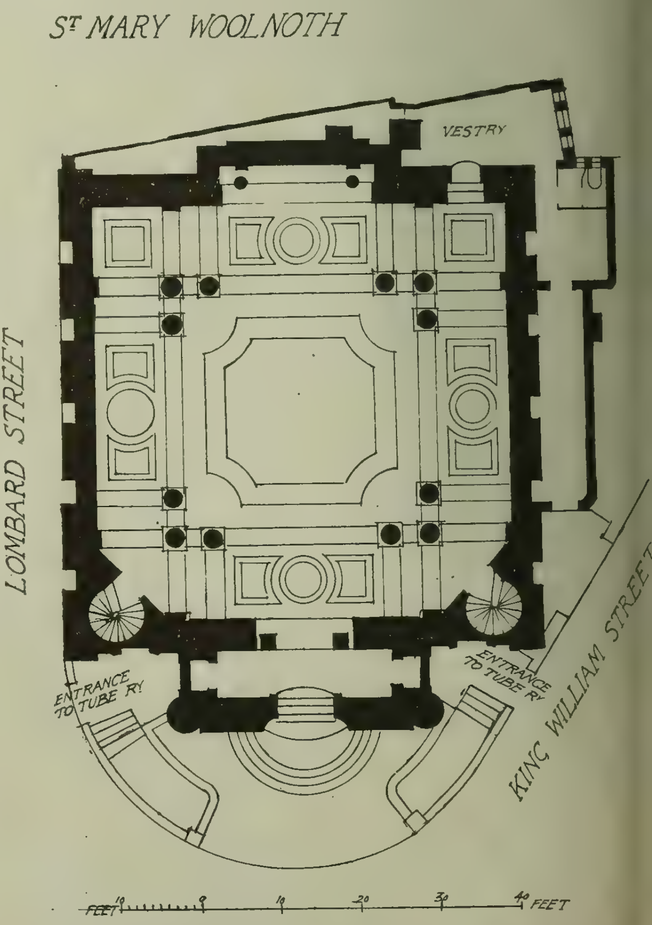
Transport Facilities.

We have received a letter from Mr. Arthur Collins, M.Inst.C.E. and Past-President of the Institution of Municipal and County Engineers, in which he again draws attention to the necessity of reforming our railway transport system. He sees "nothing excellent" in our freight rates being the highest in the world and in the fact that a railway-wagon is only used on the track for 3 per cent. of its time, which naturally justifies the assumption that more railway-wagons are bought and paid for than are actually required. He also sa
that in the United States, while prices average higher, the cost of
railway-wagon unit for unit is lower than that which obtains her
The reason of this is that our wagons must comply with the requir
ments of the Board of Trade, while the Pullman wagons are und
no such obligation. We agree with him that it is unwise to pla
unlimited reliance on any Government department and that t
data which he quotes should be investigated and examined.
is clearly important to the welfare of our trades and industries th
they should have all the advantage of cheap internal transportati
rates, and it is equally evident that there is no *primâ facie* reas
why our traders should not have it. It is true that private own
in the past have been allowed to hold railway companies up
ransom when they constructed their lines, and that rati
authorities use them in many cases unfairly. But, apart from the
items and the undoubtedly stringent provisions of the Board
Trade in respect to public safety, we know of no reasons why o
freight rates should be maintained at their present level.

Lead-Poisoning.

We have received a letter enclosing extracts fro
papers in the Midlands dealing with the dange
attending the use of lead paints and the advanta
of using zinc substitutes. It is said that leadle
paints are making great headway in the Birmingham district. Arc
tects, it is suggested, ought to help in the matter, which it is urg
is one of greater moment than the incompleted statistics we are ab
to obtain would lead us to believe. We feel that the questi
is primarily one for the authorities and for painters themselve
and that as far as architects are concerned it is still necessary
show that there are substitutes for lead paints which are equal
good, and this has not been entirely demonstrated at present.
know that good substitutes exist, but few architects are convince
that lead can be entirely dispensed with. We know also that
reasonable precautions are taken and cleanliness insisted on the
is little danger to health; and the question arises whether we shou
treat the painter as a naughty child or give him proper warni
of the dangers which may attend his calling. Most of the dang
arises from the dry rubbing down of old painted work, which c
be dispensed with or only permitted if the painter wears a respirato
the remaining dangers are obviated by ordinary care and cleanlines
which are within the control of the individual.





(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

E LONDON CHURCHES F WREN AND LATER RCHITECTS OF THE ENAISSANCE.

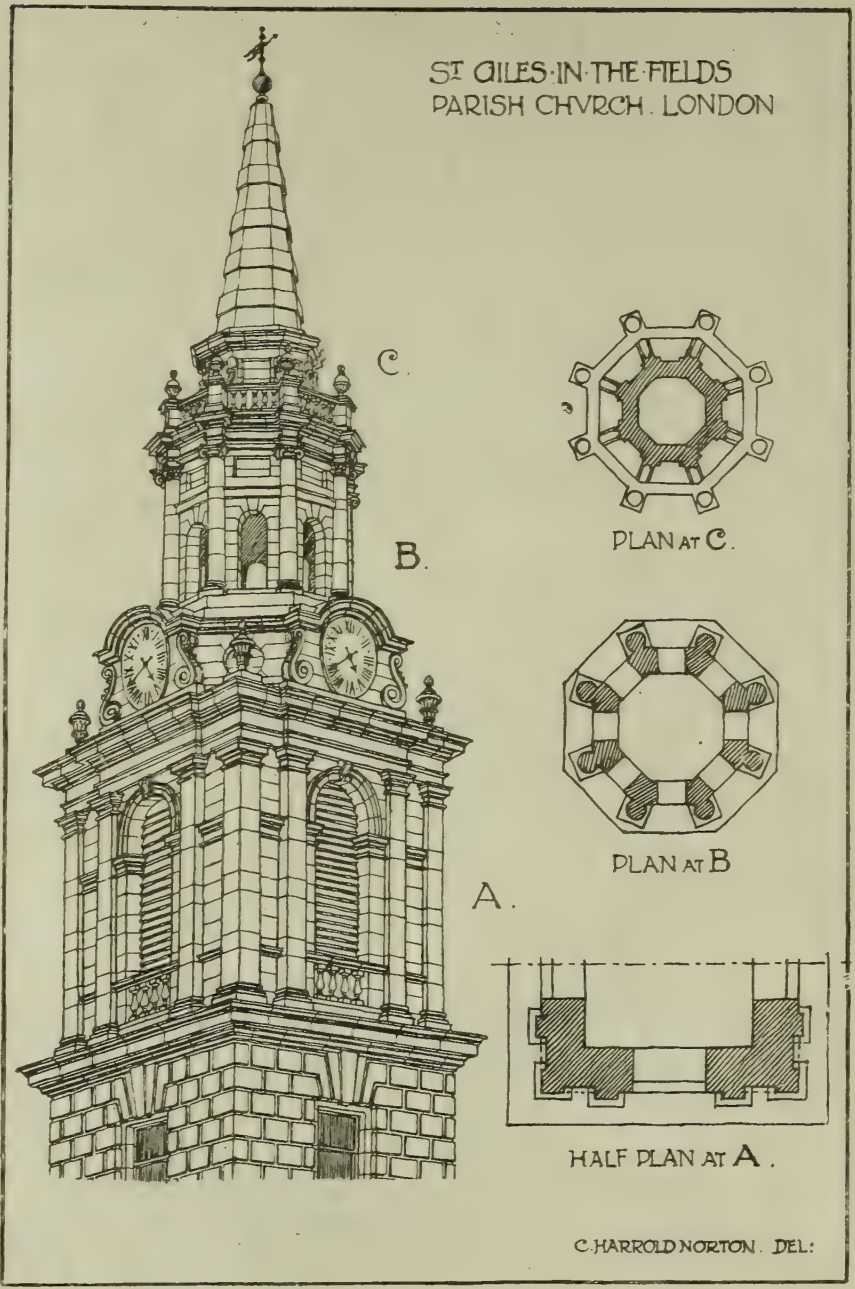
No. XXXVII.—St. Giles-in-the-Fields.

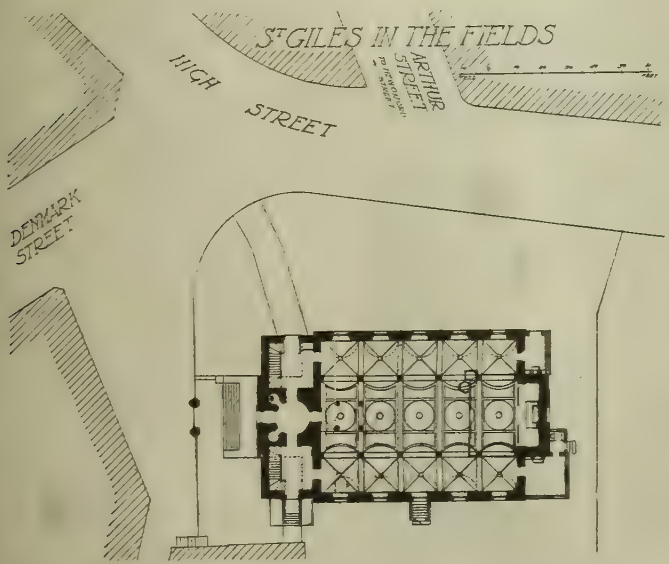
E church of St. Giles-in-the-Fields was d on the site of two former structures. parish undertook in consideration of a of £8,000 towards the cost of a new h to pay the stipend of the rector of the parish of St. George, Bloomsbury-square. Flitcroft, the architect, contracted with rustees to pull down the old church and mplete a new one according to plans and lel for the sum of £7,030; the old materials, ting monuments, were to belong to him, he church was to be completed on or December 25, 1733. The church lly cost £10,026. Flitcroft also designed hurch of St. Olave, Tooley-street. He he son of the gardener to King William at ton Court, and was apprenticed to a and became a member of the Joiners' any, by whom he was fined in 1747 for ndertaking the duties of renter warden on n to that office. Like other men of his e filled a variety of posts, finally becoming troller of his Majesty's Works in England, ich office he was succeeded by William bers.

Giles-in-the-Fields is well and simply ed on very similar lines to St. Martin-in-elds. which it strongly resembles, and ns a marked contrast to the more heavy onumental type of subsequent churches, ich the influence of Vanbrugh is more ly marked than that of Wren.

No. XXXVIII.—St. Mary Woolnoth.

church of St. Mary Woolnoth is the of Nicholas Hawksmoor, whose training gained under Wren, by whom he was yed at the age of eighteen as "the tic clerk." He was afterwards deputy vor at Chelsea Hospital and clerk of orks at Greenwich Hospital and also Kensington Palace. Under Sir John ugh he was employed as assistant vor of Blenheim between 1705–15. ary Woolnoth was built between 1720–30 e united parishes of St. Mary Woolnoth St. Mary Woolchurch, Lombard-street. so built the churches of St. George-in-the- in 1716–19, St. George, Bloomsbury-e, 1723–29, and Christ Church, Spital- His work, of which St. Mary Woolnoth ood example, shows that he was far more nced by Vanbrugh than by Wren, and is er study in the effective use of rustication he omission of columnar architecture.





(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

A curious feature of the church is the treatment of the centre of the western front, which suggests the merging of two western towers in one composition. The church, though only equal in size to one of Wren's smaller churches, is treated far more monumentally and with a disregard of cost, which is in marked contrast to the economy practised by Wren. The monumental element had at this date influenced English designers, whose planning began to show an indifference to the practical considerations which were so evident at an earlier date. The arrangement and design of the niches on the north wall are most ingenious and effective, but the church is, in spite of its architectural qualities, a somewhat gloomy and forbidding structure. Hawksmoor is described as being a skilful mathematician, geographer, and geometrician.

◆

RAEMAEKERS' RED CROSS GIFT.

It is stated that Lord Furness has purchased outright by private treaty the full set of the first proofs of Mr. Louis Raemaekers' war cartoons, which remain on exhibition at the Fine Art Society's Galleries in New Bond-street until June 10. The proceeds of the sale will be divided between the Red Cross in France and in England.

SILICA AND FIRECLAY MATERIALS.

A paper was recently read by Mr. John West, M.Inst.C.E., M.I.Mech.E., of Manchester, before the Manchester District Institution of Gas Engineers (President, Mr. Edward A. Harman, M.Inst.C.E., Huddersfield), on "Silica and Fireclay Materials," giving practical examples of their expansion, contraction, and refractory qualities. In the course of his paper the author said:—

"I have been invited by your President and Council to read a paper before this Institution upon the important question of the refractory materials and the behaviour under heat of fire-resisting materials used in retort settings in gasworks. It is a study which has always had an intense interest for me throughout my long connection with the gas industry, and it is one which all gas engineers should more than ever to-day place to the forefront—more than ever because the costs of maintenance and renewal are anything but negligible quantities in the economy which is so essential in these days of higher costs in all directions and of stern competition. The profit and loss account of all gas undertakings is—I am speaking of normal times and not of the prevailing war conditions—mainly dependent upon the successful results obtained with the carbonising plant, the successful operation of which is absolutely contingent on the behaviour of the fire-resisting materials employed in its construction. Hence the paramount importance of a full and practical knowledge of these materials.

My training as a gas engineer emphasised the imperative necessity of obtaining the very best fire-goods for retort settings. While in charge of the Maidstone gas undertaking I erected, for experimental purposes, a small working plant, and, inasmuch as it was necessary to let the retort down rather more frequently than is customary in ordinary practice, it was requisite that the very best retorts obtainable should be used. After consultation with a retort-maker (whose instructions were to produce, regardless of cost, the best retort he could manufacture) an excellent article was made. The retorts were costly, but in comparison with others of inferior materials they were in the long run the cheapest. This is an indication that excellent retorts could be realised at least forty years ago.

After being appointed Chief Engineer to the Manchester Corporation gas undertaking—this is looking backwards many years—one of my first duties was to arrange for the building and resetting of retort settings for the then ensuing winter. The retort and the fire-goods for this purpose had already been delivered. Upon inspection of the retorts they were found to be very defective and insufficiently burnt, and deserved to be rejected. They had, however, been paid for, and there was not sufficient time in which to obtain new ones. So, reluctantly, they had to be used.

The purchasing methods employed by the Gas Committee of advertising and inviting tenders for so many thousand feet run of retort, without any definite stipulations as to the quality of the materials they were buying, appear very extraordinary and very wrong; but they were not the only corporation or company who were following this bad system of purchasing retorts and other fire materials. You will, I am sure, agree with me that such a practice could only be conducive to inferior and low-priced material being tendered for, and it was certainly no encouragement to good firms to manufacture the best possible material. I found that under these loose advertising conditions, with quality not being properly taken into consideration, many firms would not quote for their best goods.

However, reverting to the defective retorts which had been delivered, I reported the matter to the Gas Committee, pointing out the loss that would be sustained by using such bad-quality material, also that, instead of haggling over a 1d. per foot extra for retorts, an additional 1s. per foot was not a large matter if the full value was put into the retorts; further, that the cost for labour was about the same for setting a good retort as a bad one, and, moreover, that there was a great loss of gas, owing to the contraction of the inferior retorts and their exceptionally short life.

At the same time I recommended that the old and pernicious system of inviting tenders should be dispensed with, and, as an experiment, that the Committee should invite tenders from four well-known firms of good repute, each for ten settings of through retorts of the best quality, with the view of testing the materials under the same conditions and to encourage the makers to do their very best as to quality. The makers were told that future orders would depend upon the result of these tests. Naturally, we had to pay more than formerly for the better retorts, but the working results were very satisfactory indeed. The retorts lasted fully double the time that the former inferior and low-priced retorts had done, and the annual saving, as the result of decreased maintenance charges, was very considerable.

The advent of gaseous firing enabled us to obtain higher heats in retort settings. Consequently, retorts and bricks of greater fire-resisting quality were required to obtain, without destroying the settings, the full advantages of the higher temperatures employed, and greater use was therefore made of silica fire-goods on account of their higher refractoriness, especially in the combustion portion of the settings and around the underside of the retorts.

About twenty-five years ago I commenced to turn my attention particularly to the manufacture of silica bricks, and was instrumental in establishing a brickworks for the purpose in Derbyshire. During this period many and varied experiments have been made with a view to obtaining a reliable silica firebrick. The experience has been extremely interesting, the subject, though surrounded by many difficulties, being an absorbing one. The difficulties as time proceeded have, I venture to submit, been successfully overcome.

As you are no doubt aware, most silica bricks expand, while ordinary fire-goods contract, very materially when subjected to
high temperatures; and you will appre
that both these features are very objection
A long time ago I came to the conclusion
all fire-goods should be made as far as pos
so that expansion and contraction should
the minimum; and I also believed tha
careful and steady experimenting with va
mixtures this much-desired result coul
achieved. As you, of course, know,
goods are difficult to manufacture, owin
the very small percentage of binding mat
permissible in their composition.

[*Photo: Geo. Trotman.*

St. Mary Woolnoth, E.C. (*See page* 415.)

Most of the silica obtained from the pi
which I am interested in Derbyshire is pr
by analysis to be very pure. It con
about 96 per cent. of silica, so that there
very good margin for the manufactur
highly refractory bricks. After many ex
ments, we succeeded in making an exc
and highly refractory brick which in the ex
mental furnace did not show any sig
expanding or contracting. Samples of
bricks were sent for testing to Dr. Mellor
he stated that the material neither expa
nor contracted at cone No. 12, 1,350 de
(2,462 deg. Fahr.). These non-expanding
bricks have for many years past been us
me in horizontal settings, particularly in
positions exposed to the greatest heat, wit
results that combustion chambers have p
cally retained their original shape under
temperatures and retorts have remained

The importance of these features, espe
with retorts operated by stoking machi
will be appreciated.

The question of the expansion and contra
of refractory materials is a very serious
important one; and it is only by great
and frequent observation that a decision c
arrived at as to the actual behaviour und
working conditions, more particularly in re
of the load on the material at high tempera
To make a suitable selection of materia
use in the various forms of retort settin
therefore a difficult problem, partic
in these days of high temperatures,
there is a combination of silica and ord
fireclay goods in a setting, the silica hav
tendency to expand and the fireclay a ten
to contract—two distinct variations tro
some to deal with.

Much has been said and written abou
alleged superiority of German-made r
and other fire materials, and a few words
not be out of place here on the subject.
is no doubt that the Germans have mad
in the case of many of their other indus
a special study of firebrick production
retort-bench construction, and in this they
been assisted very much by German gas
neers and scientists. Cost, too, has not
regarded, for in that country the maker
higher prices, *pro rata*, for their goods th
obtainable in England. It is acknowl
by all who have studied the matter that
is as good material in Great Britain as th
in Germany, and that it is only a questi
bringing scientific and practical exper
into the manufacture to produce finished
which will compare more than favourably
those of German make. With every confi
I say that British manufacturers will ri
the occasion and maintain their position.

With the kind of material made in Ger
I have some personal knowledge. Mr. Irmi
the Chief Gas Engineer of the Copenh
Municipality, some years ago made
exhaustive experiments in his combu
chamber arches with the best German mat
against the Derbyshire silica bricks.
the German materials gave way, the Derby
materials kept their original form, and
became glazed on the outer surface. I
municated with Mr. Irminger recently on
subject, and he replied as follows:—"Atte
may be called to the arches in the combu
chambers of our setting being of silica b
and bricks throughout, and this prevents
retorts which are supported by them
sinking, as the silica material expands
little. Arches of ordinary clay bricks of
best German materials have been foun
sink more than 6 in., the bricks, in my opi
not being burnt at a sufficiently high tem
ture, and contraction subsequently takes p
Since we commenced many years ago the
of the Derbyshire silica firebricks in our ar

the highest temperature prevails, we ıever found any sinking of the 20-ft. long supported by the silica arches—the on being equal to or more than the (say, about 1,500 days), while with est German materials the duration was some hundred days, on account of the of the retorts, which prevented the use king machines."

Irminger also said that he thinks it sible to obtain reliable tests with fire- after only a few hours' trial in a laboratory ordinary atmosphere, and that it is a on of time, together with the chemical at high temperature by different gases. these factors can only be realised in working over a year or more. He on to say: "I have experimented very by placing bricks in the combustion er from 200 to 300 days; and when the are cooled down to make a thorough nation of them. The best proof is I have some of the best German clay retorts o very well for some months, but they ards commence to shrink. Therefore me proof is necessary." I quite endorse rminger's views, and know of other ers who are of the same opinion."

◆

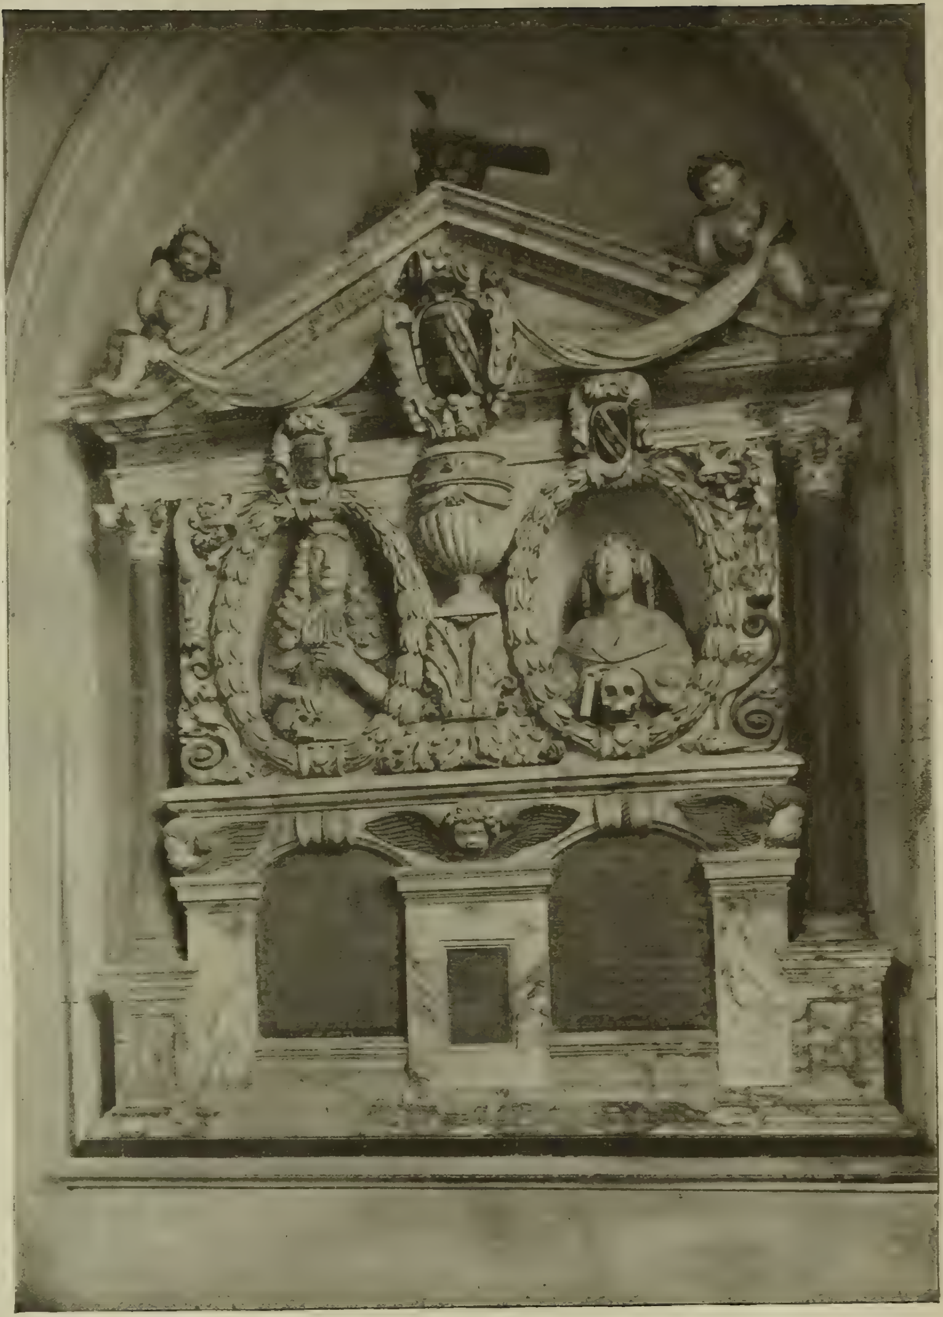
BOOKS.

h Mural Monuments and Tombstones. ndon: B. T. Batsford, Ltd. 12s. 6d.)

admirable little book contains a selection ghty-four photographic illustrations of ablets, table tombs, and headstones of venteenth and eighteenth centuries. The ts have been specially selected by Mr. rt Batsford, and Mr. Walter H. Godfrey, , has written the introduction. No more tune and useful work could have been ced at the present time, for the examples ed show that our forefathers excelled in itable commemoration of the dead more edly than they did in the provision of modation for the living. More than while a knowledge of the architecture st ages helps us in designing now, but t be adopted without many modifications, mural tablets of the seventeenth and enth centuries are in most cases directly able to modern wants, and are therefore eater value to our craftsmen. As a quence of war we shall have many ments to erect, but because of the of the times they must be treated in the simple and inexpensive manner, and in the of the seventeenth and eighteenth centuries conditions were usually paramount. Old ptions give us a lesson in brevity and ssiveness, and, while the sentiment of y would render them in many cases ropriate, they may yet be regarded odels, and the lettering used cannot mproved upon. How simple a mural ment may be made is shown in No. 17 St. Mary the Virgin, Oxford, and No. 18 St. Mary the Great, Cambridge, while . 24, which we illustrate, we have a note eater elaboration, which is a most pleasing ple of freer Renaissance design. This should be in the hands of every craft er in marble and stone, while it should a secondary object in calling the attention e public in every locality to the rich ures of design to be found in many old hes in every part of the country. The mental mason of to-day may be said to added a new terror to death, while our stors understood its pathos and beauty, made the world of the living richer by knowledge. We may indeed say with her meaning, *Sos monumentum requiras mspice,* for this little book will teach y what to look for. It is almost superfluous y it is excellently produced.

Construction of the Panama Canal. By ILLIAM L. SIBERT, Brigadier-General U.S.A., ivisional Engineer, Panama Canal, 1907-14, d JOHN F. STEVENS, Chief Engineer, 1905-7. ondon and New York: D. Appleton & Co. . 6d.)

useful and well-written book contains a account of the greatest engineering work he age, an account in which technicalities are avoided, but which is sufficiently detailed to be of use to engineers. The American Government in undertaking the work were fortunately aware of the immense difficulties of the project, and therefore avoided the mistakes which led to the abandonment of the French canal and proved the Waterloo of M. de Lesseps, who hoped to add to the renown he had gained at Suez by the accomplishment of a work as important for America as the Suez Canal has been for the Old World. The magnitude of the work already carried out can be estimated when we remember that the completed portions utilised and the plant provided for it which were incorporated in the American scheme are estimated to cost nearly £2,000,000. The authors of the book state with pride that the American canal was carried out at the estimated cost and in the stipulated time, and it affords an admirable object-lesson of what can be done by well-directed national administration and organisation. Among other wise decisions made was that of bearing in mind the true meaning of *festina lente,* for the canal work proper was not undertaken before the Government had had full and exhaustive reports on the relative merits of the rival schemes of a sea-level canal and one with locks. They also made every arrangement for successfully combating disease common to the conditions of an admittedly unhealthy region, with such success that all danger from yellow fever—that curse of the tropics—was eliminated. Every preparation was made for the housing and well-being of the workers, so that what might have been a perilous and dangerous task became a standing lesson of the way in which sanitary problems can be dealt with. The success of the enormous undertaking was due to the joint work of many eminent men, but it is probable that Major George W. Goethals, who was the chief engineer and executive officer of the commission during the entire period, will be most prominently associated with its success. The book contains well-written chapters dealing with each section of the work, which space does not permit our commenting on, but the summing up in favour of the method under which the canal was constructed, by national agency instead of ordinary contracts, deserves full consideration, since it goes to prove that the greatest of works can be economically undertaken by a Government if it employs the right men. The lesson of the Panama Canal for us is that a Government should avail itself of the most competent advice, for in this way alone can the interests of true economy be promoted.



Mural Tablet, Stanton Harcourt, Oxfordshire.
(From "English Mural Monuments and Tombstones.")

GENERAL NEWS.

The War Fair.

The War Fair in aid of the funds of the Wounded Allies' Relief Committee has been opened in the Caledonian Market.

Exhibition of Home Industries.

The annual exhibition of the Home Arts and Industries Association was opened on Wednesday last week at the Hon. Mrs. Newdegate's house, 36, Grosvenor-place.

"Drake" as a Pageant.

Mr. Louis N. Parker's play, "Drake," is to be played in the open air at York (where Mr. Parker produced a notable pageant in 1909) in aid of the two V.A.D. hospitals there. The Yorkshire Philosophical Society has lent the Museum Gardens for the production, and should the weather be bad the performances will take place in the Theatre Royal. They will take place on Wednesday, Thursday, and Friday, July 26, 27, and 28, and there will be a preliminary performance, attended by convalescent soldiers.

The Surveyors' Institution: Military Service.

The large number of men possessing surveying and constructional qualifications, who are now being called up for military service, makes it impracticable for the authorities in all cases to take advantage of their professional experience by allocating them to the technical branches of the Army. It may therefore be of interest to some to hear that the Secretary of the Institution is in a position to say that Lieutenant-Colonel Cranfield, commanding 3/7th D.C.O. (Middlesex Regiment), is prepared to give members of the Institution or their assistants an opportunity of enlisting in that battalion and, as far as possible, to allow them to serve together in the same platoon. Intending recruits should communicate direct to the headquarters of the battalion at Solefields Camp, Sevenoaks.

Town Planning Institute.

The annual general meeting of the Town Planning Institute was held recently at the Institution of Municipal and County Engineers, Victoria-street, Westminster. Mr. Raymond Unwin (President) occupied the chair. The following members of Council were unanimously reappointed:—

Architects.—Messrs. S. D. Adshead, P. B. Houfton, H. V. Lanchester, A. S. Soutar, P. T. Runton, R. Unwin (President).

Engineers.—Messrs. J. A. Brodie, J. W. Cockrill (Senior Vice-President), W. T. Lancashire, H. E. Stilgoe, J. A. Webb (Associate Member), E. Willis (Associate Member).

Surveyors.—Messrs. T. Adams, W. R. Davidge, T. H. Mawson, G. L. Pepler, G. N. Dixon (Associate Member).

Legal Members.—Messrs. E. R. Abbott (Vice-President), J. T. Birkett, R. A. Reay-Nadin.

Legal Associate Member.—Mr. C. P. Lovelock.

Hon. Member.—Mr. W. R. Jeffreys.

Associate Member.—Sir R. A. Paget, Bart.

Ex-Officio Member.—Mr. P. Abercrombie (Hon. Librarian).

The name of Mr. Chalton Hubbard was added to the list of legal members on the Council. Following the annual general meeting, the adjourned discussion on the papers by Mr. H. R. Aldridge and Mr. H. Shawcross on "The Town Planning Proposals of the Urban Land Report" was taken. Mr. Aldridge, in his paper, suggested that town planning should be made obligatory.—Mr. Cockrill maintained that obligatory town planning was necessary, as hardly a day passed in a town that was developing, or even in a place that was not developing, but what the Town Planning Act would prevent things being done that would be a blot for all time.—Mr. Stilgoe pointed out that it was easy to say that the general law could be amended in certain respects and the same results obtained, but if the local authorities had to wait for that there would be no progress. We were advancing very rapidly, and most people thought that immediately the war was over there would be needed a larger number of small houses suitable for the working classes.

Technical College for Middlesbrough.

Mr. Joseph Constantine, a Middlesbrough shipowner, has given £40,000 towards a scheme for the establishment of a technical college in the town, and other local firms have promised £15,000.

Italian Artists and the War.

An exhibition of pictures dealing with the war by Italian artists will be held shortly after Whitsuntide at the Leicester Galleries, Leicester-square. The leading artists of Italy are contributing to it, and the exhibition will have an official character by the inclusion of a large collection of paintings of the war on the Italian front by the artist, Ludovica Pogliahi, who has been authorised by the Italian Government to execute the series. Signor Pogliaghi is well known to visitors to Milan as the designer of the bronze doors of the Cathedral.

The Rebuilding of Dublin.

The following letter by Mr. Ernest Newton, President of the Royal Institute of British Architects, appeared in the *Times* of Wednesday: "Sir,—It is to be hoped, notwithstanding the difficulties and distractions of the times, that the rebuilding of the Sackville-street district will be carefully considered. There is always a temptation to go along the line of least resistance and to rebuild a destroyed area in the quickest possible way in order to rehouse the inhabitants; but if careful thought and a little time are given to the problem now the result should be an ordered and considered scheme worthy of the City of Dublin and its fine architectural traditions."

In the House of Commons on Thursday last week Mr. Asquith, asked by Mr. R. M'Neill whether, with a view to the prevention of vested interests being created which would interfere with the rebuilding of Sackville-street, Dublin, as part of an architectural and town-planning scheme worthy of the position and natural features of the thoroughfare, the Government would take immediate steps to acquire the whole area in order to be in a position to control the rebuilding, replied:—The Home Secretary is proceeding to Dublin to discuss this with other questions. I can make no statement until after his return. Mr. MacCallum Scott: Is the right hon. gentleman aware that the worst of all architectural effects are produced under Government controlled schemes? Mr. Asquith: That is a matter of opinion and experience.

Major Phillips Fletcher.

Major H. Phillips Fletcher, F.R.I.B.A., F.S.I. (partner in the firm of Messrs. Banister, Fletcher, & Sons), of the Middlesex Hussars, has returned to England on being gazetted to the Royal Flying Corps. The Major had been attached to the French Navy as Commandant of the British Military Observers who were flying with French pilots in the East. He was awarded the Croix de Guerre in August last for reconnaissances under fire for the first time, and before leaving the French Squadron received it again on two further occasions, once more for work with the Navy and once with the French Army. This entitles him to wear palm leaves and two stars on the riband of the order. He is the only British officer thus decorated.

British Memorial of the Centenary of Argentina's Independence.

It is announced that Sir Reginald Tower, his Majesty's Minister, has formally presented to the President of the Argentine Republic the clock tower which has been erected in the Plaz Britanica at Buenos Aires. The foundation-stone was laid by Sir Walter Townley, then British Minister to the Argentine, on November 26, 1910. The tower was designed by Mr. Ambrose Poynter, son of Sir Edward Poynter, President of the Royal Academy. The contract for its erection was given to Messrs. Hopkins & Gardom, who have carried out the work under the supervision of Mr. M'Carthy, clerk of works. The height from the ground to the three-masted ship which serves as a weather-vane is 200 ft. The tower is square in form and supports an octagonal drum and cupola, the latter covered with copper and surmounted by a vane. An electric lift is fitted in the interior. On the ground floor is a hall or waiting-room.

Cardiff Hospital.

Sir Edward Nicholl has given £10,000 to King Edward VII. Hospital at Cardiff. sum is to be devoted to the erection of a wing, and is given on the occasion of the ho of knighthood conferred by the King.

The Architectural Association of Irelan Dublin.

The following resolution was passed meeting of the Committee held on the 31st ult "In view of the large amount of impen architectural work in Dublin, the Commi of the Architectural Association of Ire desire to call the attention of architect practice and assistants to the register whi kept at the Association offices. This regi under the present abnormal conditions, have decided to throw open free of ch Every effort will be made to assist practi architects and assistants at the pre juncture." Applications should be addre to the Hon. Secretaries, the Architect Association of Ireland, 15, South Frede lane, Dublin.

Architects and Military Service.

We are informed that the 20th Lon Regiment (T) has vacancies for some 500 If sufficient architects joined this regimen "Architects' Company" would be formed they would be kept together during trai The regiment has two battalions in Fra and a third battalion is being formed for purpose of supplying drafts to the first second battalions. Intending recruits sh apply to Major Dodd, Holly Hedge Ho Blackheath. (Telephone: Lee Green Lieutenant-Colonel S. W. Cranfield (A.R.I.B commanding the 3/7th D.C.O. (Middl Regiment), states that he is prepared to fifty or sixty architect recruits in his batta They must be medically fit for service abr Intending recruits should write to H quarters, 3/7th D.C.O. (Middlesex Regim Solefields Camp, Sevenoaks, and they receive a free railway warrant.

Excavations at Dunfermline Abbey.

With the authority of the Crown, Mr. Macgregor Chalmers, architect, Glasgow conducting search-work in the nave of fermline Abbey Church. The object of operations is understood to be to ascer the nature and extent of St. Margaret's Cha which existed prior to the nave, and may been used for worship while the heavy mas walls and pillars of the old part of the ch were being built in the twelfth century. presumed from the trenches which have dug that the chapel had occupied a site wi the interior lines of the two rows of pil with its apex at the landing at the centre entering the new church. The odd fragm of standing masonry which have been laid point to the existence of a structure of s kind there at a very remote date, and *débris* suggests that the present floor of nave had been used as a place of sepultur *Glasgow Herald.*

The President of the Surveyors' Instituti

Mr. George Francis Stewart, the recen elected President of the Surveyors' Institut was born in 1851. He was educated Marlborough College and Trinity Coll Dublin, where he graduated Senior Moder and Gold Medallist in 1872. He then ent his father's office, and in 1878, on the deat the Earl of Leitrim, went down to the Cou Leitrim in charge of the extensive Clem Estates in that county. Since 1879 he been a magistrate and grand juror, and si 1900 Deputy Lieutenant of the County Leitrim, in which he has a large numbe agencies. He served as High Sheriff in 1 and for many years has represented the cou on the Central Executive of the Landlo Convention. In 1885 Mr. Stewart becam partner in the firm of Messrs. J. R. Stewar Sons, Dublin. Of recent years he has been gaged in many important arbitration cases, has negotiated a large number of sales un the various Irish Land Acts. He is a mem of the Senate of Dublin University (Tri College), and in 1902 he was elected a dire of the Bank of Ireland, of which he has b Governor for the last two years.

ILLUSTRATIONS.

The City Companies: Goldsmiths' Hall.

WE are not able at present to illustrate Fishmongers' Hall, which is now being utilised for purposes in connection with the war, but hope to so subsequently; but we give illustrations of e Goldsmiths' Hall, Philip Hardwick's fine ilding, which is one of the best examples of glish architecture of its date.

City Improvement Scheme, Oporto.

WE illustrate two views made by Mr. Raffles vison of the very fine improvement scheme ich Mr. Barry Parker has designed for the y of Oporto. The area has already been ared, and the scheme will be proceeded with rtly in its entirety. In Portugal the owner allowed to fix the rateable value of his own operty, but this rateable value fixes the ount of compensation to be paid to building ners when public bodies wish to carry out provement schemes, and there can be no spute or delay in carrying out schemes owing the demands of private owners. We have eady commented on this very fine project— nost, if not quite, the best scheme of the kind have ever seen—in our article on "Architec-re at the Royal Academy" (May 5).

CORRESPONDENCE.

The Commercial Value of Design.

SIR,—Whilst in general sympathy with the ews expressed by Mr. Hamilton T. Smith this subject, there is something to be said the manufacturer's point of view.

There are manufacturers in this country o would be quite ready to collaborate with signers, in a whole-hearted way and without nting expense, but for the fact that they ow, sometimes from costly experience, that e venture will probably be unprofitable.

Mr. Hamilton T. Smith mentions the gas e. I know a firm who really did try to get t a set of inoffensive designs, studying oportion, restraint in the use of detail, and ility, but because these designs did not nform to the standard dimensions laid down the gas engineers, who are the buyers in reat Britain, the experiment was a failure. he public do not buy gas fires, they hire em, and the engineers decide what is good ste.

The firm I have in mind would have lost s entire business in this branch of trade ad they not accepted the conditions. The aveller was instructed to obtain from his stomers the standard dimensions, and the works manager then said to his designer, "Here are a series of dots; draw lines through them and make them into designs." This manager resented the position, but the only alternative was to close his shops.

Although the gas engineer is probably the chief sinner in this country, there are others who also have the power to control taste, such as the ironmonger and speculating builder. As we all know, plain things cost more, and ignorant eyes cannot account for it. The ironmonger and builders' merchant naturally aim at stocking goods they can sell easily, and the builder does not want any convincing that the more showy, cheaper article is the best from every point of view.

My remarks do not refer to special work—an architect knows where to get that to his liking, but it is practically impossible to get the cheaper common things nice, neither would there be any monetary reward to the manufacturer if he tried to supply them, simply because the general demand is for the other sort.

Those people who would like to live with quiet plain fittings in their homes are only a proportion of the whole, and have no power to influence the people I have mentioned, whereas the vast majority are perfectly content with "taste" as expressed by the gas engineer, the ironmonger, and the speculating builder.

DESIGNER.

St. Paul's Cathedral.

SIR,—The greatest danger to St. Paul's Cathedral is the enormous weight of the outer dome of timber, lead, and iron, and has caused all the mischief to the piers. As I pointed out some years ago, some of the stone blocks used in constructing the piers were placed on their grain instead of bed. This caused the cracks on account of the enormous pressure of the weight on the base. The iron ties in piers also perished by rust. The outer dome is constructed of great timbers nearly 250 years old. The base is surrounded by a heavy iron cable chain. This outer dome is covered with lead. Dry rot and vermin have attacked the timber and rust the ironwork, exactly as the timber roof of Westminster Hall was perishing from dry rot and insects. As most people are aware, St. Paul's Cathedral is built on Ludgate-hill, whose soil is clay and liable to slide, especially if a heavy pressure is applied such as the enormous weight of the above-mentioned outer dome. The repairs of piers, etc., will, I am afraid, not be permanent unless the enormous weight is removed. If this were done we need not fear for the safety of St. Paul's Cathedral—the masterpiece of the great architect, Sir Christopher Wren. As I said before, unless the dangerous heavy outer dome is reconstructed in a light, strong, fire and weather proof material nothing will save this grand and beautiful building.

HENRY H. B. SANG,
Architecte-Decorateur.

P.S.—I find that the only metals which will agree with plaster or concrete are either copper or aluminium.

Defective Water Supply to Bath.

SIR,—Can you or any of your readers suggest a satisfactory solution of the difficulty caused by the fact that the cold-water supply to my bath runs in a mere trickle? The tap has been in use some thirty years, I believe, and possibly it is lined (or the service-pipe is) with a thick coating of sediment. The only suggestion I have been able to get is to have a new pipe laid to the main, and this means digging up my lawn and making a frightful mess generally, to say nothing of expense.

PUZZLED.

ESTATE OF AN ABERDEEN BUILDER.

The inventory of the heritable and movable estate of the late James Park, builder, 31, Cranford-road, Aberdeen, who died on February 14 last, has been lodged with the Sheriff Clerk and amounts to £18,910 16s. 2d.

ARCHITECTURAL SOCIETIES.

The Royal Institute of the Architects of Ireland.

The Council met on Monday, June 5. The President, Mr. R. Caulfeild Orpen, was in the chair. There were also present:—Messrs. W. Kaye-Parry, Vice-President, H. J. Lundy, J. H. Webb, G. L. O'Connor, W. A. Scott, F. Bachelor, F. G. Hicks, A. E. Murray, C. A. Owen, A. G. C. Millar, L. O'Callaghan, R. M. Butler, G. P. Sheridan, H. Allberry, and Frederick Hayes, Hon. Secretary. In connection with the question of the rebuilding of the late destroyed areas the following resolution was adopted:—

"That the Government should embody in any Bill dealing with the rebuilding—'power to acquire in the Sackville-street area all the sites of the destroyed property, and, where necessary, those of the premises adjoining, and to redistribute these sites, define the boundaries, and control the designs.'"

A letter was received from the Architectural Association of Ireland, expressing its approval and general adherence to the terms of the resolution adopted by the Council, and dealing with the desirability of imposing conditions or restrictions with regard to the design and reconstruction of buildings in important thoroughfares, so that they shall conform to some general scheme of street improvement.

BOOK RECEIVED.

HARPER'S HYDRAULIC TABLES FOR THE FLOW OF WATER. By Joseph H. Harper. (London: Constable & Co., Ltd. 8s. 6d. net.)

FIFTY YEARS AGO.

Sanitary State of Chorlton Union.

AT an annual meeting of the local Board of Guardians last week a report was presented from the Medical Committee recently appointed in apprehension of a visitation of cholera, to investigate the sanitary condition of the various townships in the union. Most of these are described as very bad. The reports of the various medical officers of the townships give detailed accounts of them, from one of which, that of Mr. Smith, of the Hulme district, No. 1, we may give a brief passage:—"The most unhealthy parts of the district lay between Russell-street and Cornbrook, City-road, Chester-road, and the lower part of York-street; from this quarter nearly all the cases of typhus had come during the past year; and should the cholera visit us it would locate itself in that region. There were whole streets of back-to-back houses with most imperfect ventilation and drainage. In many places there were closed courts and passages with privies in the most filthy and neglected state, and cellar dwellings of the most unwholesome character and utterly unfit for human habitation. The ashpits and shallow drains emitted a constant stench that was most prejudicial to health. Pools of surface-water and refuse lay about; and the sewage percolated through the walls even into the very dwellings."

[*** From the *Builder* of June 9, 1866.—ED.]

ST. MARY'S CHURCH SPIRE, LEICESTER.

About 40 ft. of the top of the spire of St. Mary's Church, Leicester, has been condemned as unsafe, and it will be necessary either to remove that portion, leaving it flat, or else rebuild it.

No. 4.

The Goldsmith Company.

TO GOD ONLY BE ALL GLORY

(Old Arms.) Present Motto: "JUSTITIA VIRTUTUM REGINA."

THE Goldsmith occupied a position of honour and importance throughout the Middle Ages and in the days of the Renaissance. Wealth consisted more than it does to-day in the possession of property of value in plate and jewellery, which was handed down from generation to generation, and could, if necessary, be given as a security to those advancing money. The great Goldsmiths frequently acted as moneylenders and bankers to kings, as numerous historical records show. The Goldsmith and Jeweller have provided a subject of fiction for Scott in the person of George Heriot, King James' goldsmith, and for Dumas, in Bœhmer and Bossange in "The Queen's Necklace," which both fact and fiction have associated with the tragic destinies of Marie Antoinette. The value of the material dealt with dignified the craft, and thus we find the greatest work of many an artist in times of the Renaissance is connected with the working and fashioning of the precious metals, so that it was primarily as a gold-worker that Benvenuto Cellini made his name. The value of plate and jewellery was always dual, arising from the intrinsic value of the metal itself and the added value given by the artistic excellence of the craftsmen, which in the days of Renaissance culture was fully understood and appreciated. In earlier days a gold chain served both as an ornament and a convenient form of portable wealth, an obligation being frequently discharged by cutting a few links from its length. The growth of a more complex civilisation and the use of credit have destroyed the pre-eminence of the Goldsmiths' position, while the decay of craftsmanship and the habit of regarding precious objects as luxuries rather than portable forms of wealth, more valuable than money because of the added value given by artistic excellence, have undermined the importance of the position once occupied by those whose craft was both a necessity and an opening for the most delicate craft of design.

The Goldsmiths' Company occupies the fifth place in order of precedence among the City Companies, and in the year 1180 is mentioned as being one of the adulterine or unauthorised guilds. It was amerced or fined forty-five marks—a large sum in those times—indicating that the guild was of considerable importance. The records state that in the year 1267 or 1268 an armed affray took place in the streets at night between the Goldsmiths and Merchant Taylors, and the combatants were separated by a sheriff's posse, many arrests being made and thirteen of the delinquents executed. In the year 1300 the existence of the Company was recognised in a statute, 28 Edward I., cap. 30. The standards for gold and silver were fixed, and the Wardens of the craft were given powers to assay all articles of these metals, and certain powers of search were granted to them.

The Goldsmiths chiefly congregated in Cheapside, Old 'Change (so named from its proximity to the exchange for the King's coin), Lombard-street, Foster-lane, St. Martin-le-Grand, Silver-street, Goldsmiths'-street, Wood-street, and the lane adjacent to Goldsmiths' Hall. Of these, Cheapside was their principal place of residence, and the southern side from Bread-street to the Cross was known as Goldsmiths'-row, the shops being occupied by Goldsmiths. In 1629 a movement arose for making Cheapside, Lombard-street, and its vicinity the exclusive seat of the Goldsmiths and other sumptuous shops; and the King, having noticed certain mean houses in the area, directed the attention of the Corporation to the matter in an Order in Council, but the difficulty of securing reasonable accommodation for those dispossessed delayed the change. The Government of Charles I. also threatened the City with penal consequences if all the shops in the quarter were not let to Goldsmiths and like trades or closed till suitable occupants presented themselves.

Like other of the guilds, the Goldsmiths fulfilled a dual *rôle*—that of a fraternity, the object of which was largely to secure mutual protection, to promote social intercourse, and to administer charity; and that of a craft guild to promote the interests and guard the privileges of a craft, and, in common with most of the other guilds after a period of active trade regulation, they have largely reverted to what was their original functions. Their patron Saint was St. Dunstan, to whom there was a chapel dedicated in St. Paul's Cathedral, while it was St. Dunstan-in-the-East in which the brethren and sisters attended the obits of the deceased with wax lights in their hands, and on St. Dunstan's Day the yearly feast of the Guild was held.

The powers exercised by the voluntary association were subsequently confirmed by charters, the Wardens fining workmen for making wares which were under standard, and entering shops to seize false wares, also settling disputes between masters and workmen and punishing rebellious apprentices by flogging. Heavy fines were levied on those who slandered the Wardens or reviled members of the Fellowship, and control was exercised by the Guild both in London and the country.

In the early part of the fourteenth century the Company had an Assay Office, and the statute of 28 Edward I. provided that no vessel of gold or silver should leave the hands of the workmen until it had been assayed by the Wardens and stamped with the leopard's head, at that time part of the royal arms of England.

The native and foreign Goldsmiths were divided into classes enjoying different privileges. Firstly, the members of the Company who were mostly Englishmen, and whose shops
subject to the control of the Company
who made certain payments for the sup
of the Fellowship. The second class
prised the non-Freemen or "Allowes"—
is allowed or licensed. They were descr
"Allowes Englis," "Allowes Alicant," "Ali
Strangers," and other similar titles.

These paid tribute to the Company and
subject to their control. The quarterage
by members, the tribute of the "Allow
admission fees and fines constituted the
pany's original income. English Goldsm
frequently endeavoured without success
prevent foreigners settling in London, bu
was probably known that the best artists
often foreigners and that their exclusion w
be detrimental to the craft. In 1445 th
four strangers were sworn, in 1447 C
Spaen paid £8 6s. 8d. to the alms of St. Dun
to be admitted as a Freeman, and in
John de Loren paid £20 on a similar occas
Foreigners applying for the freedom were fo
to produce testimonials from the author
of the towns abroad where they had resi
and apprentices had to make masterpi
before gaining admission to the Fellowshi

The first of the Company's charters
granted by Edward III. in 1327. Under
provisions the Company were allowed to
honest, lawful, and sufficient men skille
the trade to inquire into matters of compl
who might reform defects in the craft and pu
offenders. It goes on to state that all t
who were of the Goldsmiths' trade shoul
in their shops in the High-street of C
(Cheapside), and no silver, plate, golden
silver vessels ought to be sold in the City
in the King's Exchange or in the said s
of Cheap among the Goldsmiths. It was fur
enacted that, as many Goldsmiths kept s
in obscure turnings and streets, and bo
vessels of gold and silver secretly wit
inquiring whether they were stolen or law
come by, and immediately melted them
to make into plate to sell to merchants trav
beyond the sea, those who secretly worke
the craft behind locked doors or in obs
places were heavily fined on discovery. To
vent such practices it was ordained that no
or silver should be manufactured or sent ab
except that which was sold in the K
Exchange or openly among the Goldsmiths,
that none pretending to be Goldsmiths sh
keep shops but in Cheap.

By two subsequent charters of the same
these privileges were confirmed and exten
and licence was given to the Company
purchase and hold tenements of the value of
per annum for the relief of poor members.

These rights and privileges were confir
under subsequent charters of Richard
Henry IV., and Henry VI., while Edward
by letters patent in his second year confir
previous charters, granting that the then
dens and their successors may be a corpora

* The following articles on the City Companies have already appeared in our pages:—The Mercers' Company, March 31; the Grocers' Company, April 28; and the Drapers' Company, May 12. The Skinners' Company will be given on July 7. We shall give the Fishmongers' Company at a subsequent date.

body corporate to consist of and be lled the Wardens and Commonalty of the istery of Goldsmiths of the City of London, pable in law to purchase, take, and hold in rpetuity lands, tenements, rents, and other ssessions whatsoever of any persons that all be willing to give, devise, or assign the me to them. Their trade rights were also nfirmed. Numerous other charters followed, cluding one under James II., reserving to e Crown the right of control over the appointents of the Wardens and Clerk, an interference th the Company's powers which, like similar arters of the times, abrogating and annulling e independent powers of other City Companies, s made void under Act of Parliament in e reign of William and Mary. The governnt of the trade under the Company's charters ntinued down to the reign of Charles II., but some time before and in the interval prior the passing of the Act of 12 George II., c. 26, powers granted to the Company began to questioned, and the Goldsmiths thought expedient to obtain an Act of Parliament, ich was prepared by its officers and, together th enactments contained in the Act of & 8 Vict., c. 22, comprises the principal laws ating to the Goldsmiths' trade to-day. these Acts the Assay Office is regulated, d the charges made for the assaying and rking of plate are to be solely to defray expenses of the office, the Company being hibited from making any profit. The vers conferred on the Company are those the assaying and stamping of gold and silver te required to be assayed and stamped, and end to every part of England.

n connection with the coinage of the realm, Company have carried out what is termed "Tryal of the Pyx" ever since the reign of ward I., the first known writ for such a trial ring the date of 1281. The Mint officials bound to place in the Pyx for the use of jurors at such trial one coin out of every 00 gold coins and one coin out of every lb. Troy weight of silver coins. The ect of the trial is to ascertain if the metal which the coins are composed is standard they are of the prescribed weight. In ner times the trial was made at uncertain es, but the Coinage Act of 1870 prescribes t an annual trial shall be made, and since t date the Pyx has been brought to Goldths' Hall and tried annually. Previous the Act a jury of competent Freemen, nmoned by the Wardens, was charged by Lord Chancellor, who subsequently received r verdict. In earlier times the Sovereign netimes presided, and amongst others h James I. and Charles II. were present such trials. Now the jury is sworn by the King's Remembrancer and the verdict given in writing, after which it is published in the *Gazette*. The Pyx is the name given to the small box containing coins out of which those to be tested are taken.

During recent years coins from the branch mints in Australia and Canada have been included in the annual trial at the request of H.M. Government.

The site of Goldsmiths' Hall belonged in the reign of Edward II. to Sir Nicholas de Segrave, a brother of the Bishop of London. On his death the Company bought the premises, but the date when the Goldsmiths first built upon the site is unknown.

In 1365 we learn from an Ordinance that the Company assembled at their "common place" in the parish of St. John Zachary, and in a later entry, in 1380, there is mention of a new parlour and cellar being built, from which it would appear probable that the Goldsmiths made additions to the old house of Sir Nicholas de Segrave to adapt it for their purposes; in 1401 the Hall in Fasteres Hall is definitely mentioned. The second Hall is attributed to Sir Dru Barentyn, but no mention of it is made in the records until 1447, and its completion appears to have covered a period of many years. It was a building of considerable extent, containing a parlour and probably a Court-room, an armoury, granary, Assay Office, vaults, and chapel, and it had a courtyard. The Hall had long windows, those towards Huggin-lane being decorated with armorial bearings, and had a roof with a lantern and vane.

Stow, in 1598, speaks of it as "a proper house, but not large," and discredits the legend that Sir Bartholomew Read, Goldsmith, and Mayor in 1502, entertained more than 100 people in it.

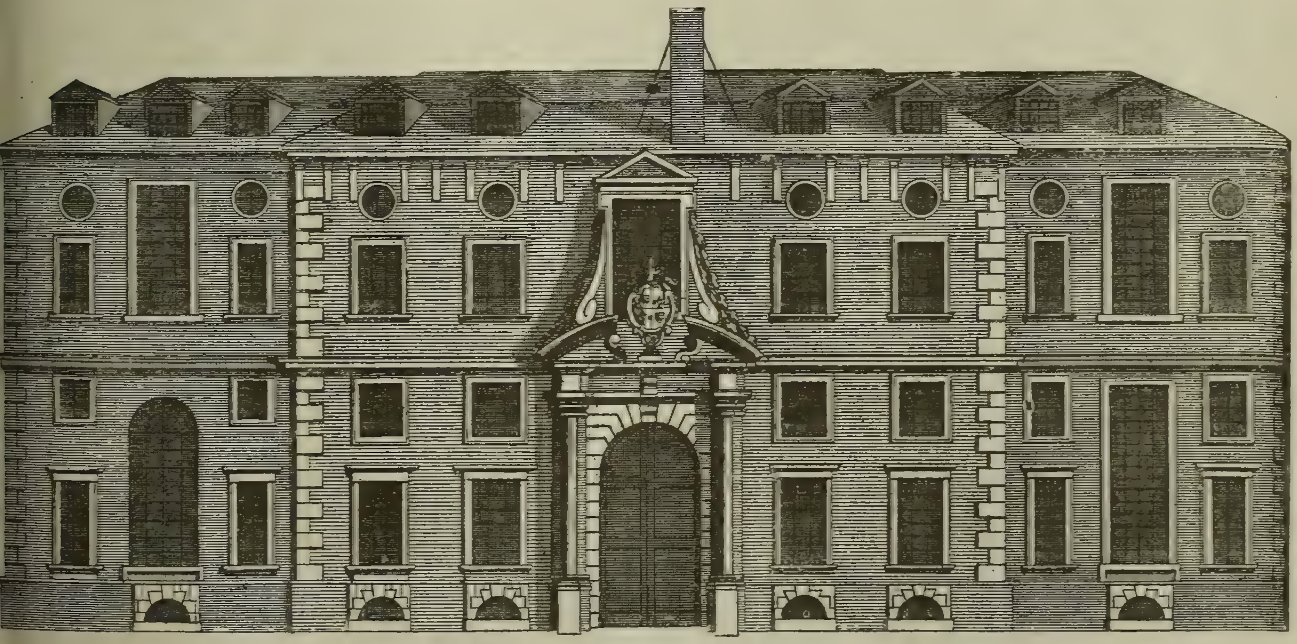
The third Hall was erected in 1634-6, the buildings being enlarged by the addition of the sites of ten houses, and Inigo Jones, the King's Surveyor, was consulted about the work, for which Charles I. gave his licence.

The Hall sustained much damage during the Great Fire, after which Jarman laid his plans for rebuilding before the Court in 1666-67; but the buildings were slowly erected in consequence of the want of funds, not being completed till 1669, while in 1681 portions of them were again destroyed by fire.

Jarman's Hall was a simple red-brick building, enclosing a paved courtyard with a lofty arched entrance. The Livery Hall, on the east of the yard, was paved with white and black marble and panelled. It would seem to have been an interesting and characteristic work of the period, though on a smaller and simpler scale than the fourth and existing Hall.

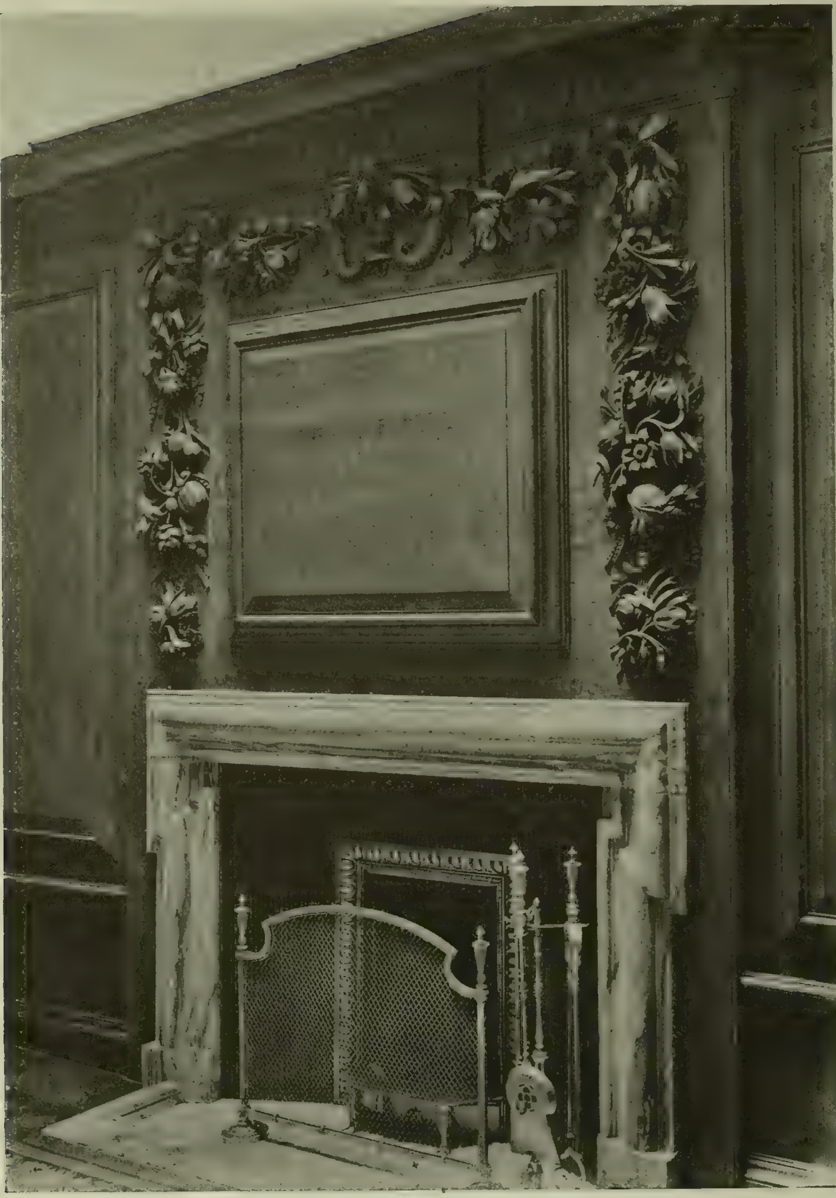
The present Hall was built from the design of Philip Hardwick, R.A., and was commenced in 1829 and opened on July 15, 1835. The plan on which most of the older Halls were laid out—that of a quadrangle surrounding an open court or garden—was abandoned for a symmetrical arrangement of greater dignity and impressiveness. The front to Foster-lane is treated in a Classical manner, and the central entrance leads to a handsome entrance-hall, panelled in oak from an old manor house at Acton. The fine ceiling was designed by Mr. A. Burnett Brown, the present Surveyor. On the right and left of the entrance-hall are offices, and immediately in rear and separated from it by a glazed and panelled screen the great marble staircase, which forms the most impressive feature of the building. The pedestals of the lower staircase flight are surmounted with figures representing the "Seasons," the work of Nixon, while in the central spaces between the coupled columns on either side of the stairway over are placed marble groups representing Cleopatra, the Libyan, Sibyl, and Medea, by Storey. Among other statuary which may be mentioned is Edward III., by Armstead, R.A., placed in a niche opposite to the first flight of the staircase. The Livery Hall is on the first floor, immediately in rear of the grand staircase, and is a finely-proportioned, dignified room of good architectural character and effective decoration. The only unfortunate feature in it are the windows, which are unpleasingly divided by mullions and transoms and filled with poor-coloured glass. Were these removed and the spaces glazed with clear glass with armorial medallions the gain in effect would be very marked. The front is occupied by the Court Dining-room, Drawing-room, and Court-room, forming a fine suite separated by wide doorways and admirably planned for receptions. The two end rooms of the suite are architecturally well conceived and proportioned; the Drawing-room is treated in a manner reminiscent of the Louis XV. style, but its detail is somewhat coarse and heavy in character for the type adopted. One of the best architectural features is the Binding-room, which Mr. Burnett Brown (Messrs. Brown & Barrow), redecorated with some old panelling, chimney-piece, and other woodwork, which was discovered in the basement of the present Hall, and are approximately of the date of William and Mary. The ceiling was lowered and a domed plaster ceiling introduced. The back part of the block contains the Clerk's house and the Assay Office, which communicates by a passage in the basement with additional premises on the opposite side of Gutter-lane.

Like other of the great Companies, the Goldsmiths have carried out a large amount of



The Third Hall of the Goldsmiths' Company, as designed by Jarman.

(From "Maitland.")



Chimneypiece in Binding-Room, Goldsmiths' Hall.

educational work and administered many charities, both on behalf of members of the trade with which they are connected and purposes of general charities. They have built and endowed almshouses in Acton in accordance with bequests made under provisions of the will of John Perryn in 1656, and St. Dunstan's Church and Vicarage, East Acton, was built and endowed in 1878 at a cost of £30,000, provided out of the corporate funds of the Company.

They also founded a Queen Victoria Commemoration Charity in commemoration of the sixtieth anniversary of the Queen's reign, and endowed it with £20,000 out of their corporate property. The interest is applied in the manner which is considered most conducive to the formation of provident habits among deserving and necessitous Goldsmiths and Silversmiths who have resided for ten years within a radius of twelve miles from Goldsmiths' Hall, and who have continuously exercised their craft for ten years previously.

In 1822 they founded six exhibitions tenable at Oxford and Cambridge of £20 each; in 1882 they had provided seventy-five scholarships tenable at the two Universities and of the annual value of £2,500. On the occasion of the opening of the new Hall in 1830 the Prime Warden was able to state that, in spite of the expenditure on the new Hall, "not one pension has been abridged, no charity has been diminished, and not one single petition for the relief of our poorer brethren has been rejected."

The Company have been connected with several well-known schools, among which are Stockport and Bromyard. In 1487 the Goldsmiths became trustees under a will of Sir Edmund Shaa for the payment of an annual sum of £10, to be applied to the support of a priest at Stockport "cunning in grammar and able to teach it." This was paid until 1830, when the Company greatly enlarged the school, increasing the stipends of the masters. By 1859 they had spent £30,000 on the school, which has since been transferred to local authorities, the Company endowing it with £290 a year in addition to the original £10.

The Goldsmiths became connected with Bromyard School in Worcestershire under the provisions of the will of John Perryn in 1656. He directed that £20 a year should be paid to a master in addition to £15 a year foundation grant. The school was remodelled in 1831 and the Company's contributions to it increased. On the suggestion of the educational authorities the school was ultimately replaced by a Secondary School for Agricultural Students in 1890, towards which the Goldsmiths' Company have contributed £10,000.

With other of the leading Companies, the Goldsmiths contribute towards the payment of £20,000 a year for promoting Technical Education to the City Guilds Institute, the buildings of which have also been erected out of funds contributed by the City Companies.

The Company have also in recent years given £87,000 to the Imperial College of Science and Technology for the extension of the City and Guilds Engineering College at South Kensington,
and have presented to the University o
London the site and buildings of the Goldsmiths
College at New Cross, as well as other gifts.

In 1892 the Goldsmiths gave £25,000 t
cover the cost of the erection of a block
dwellings by the Guinness Trust in Camberwel
a district in which many of the poorer membe
of the trade with which they are connecte
dwell.

In 1890 the duties on gold and silver plat
which had been collected by the Compan
for the Government, were abolished. This ste
had been considered to be advisable for a lon
period, but no steps had been taken, as it wa
felt that the repayment of the duties pai
on new and unused plate by dealers mu
in fairness be a precedent of the measure, an
the extreme difficulty and delicacy of carryin
out such an operation was felt to constitute
difficulty.

The Goldsmiths assisted the Government b
examining the stocks of all dealers in Londo
and the country, and in recognition of th
services they had rendered in this matt
their Clerk, Sir Walter S. Prideaux, received th
honour of Knighthood.

Our brief survey will show the importa
functions which the Goldsmiths' Compan
carried out in past centuries, and that, lik
other of the guilds, they now carry o
work of great importance and value whic
serves to supplement educational and charitab
work, while they still exercise functions whic
are in the highest degree essential to th
interests of the craft they represent and to th
public.

◆

THE LONDON COUNTY COUNCIL.

A MEETING of the London County Counc
was held on Tuesday in the County Ha
Spring-gardens, S.W., Mr. A. F. Buxto
Chairman, presiding.

Loan.—Sanction was given to the borrowi
by the Woolwich Borough Council of £1,3
for street improvements.

Electric Radiators.—On the recommendati
of the Fire Brigade Committee it was agre
to invite tenders from selected firms for t
supply of electric radiators at thirteen fi
stations.

Charging Apparatus.—It was agreed th
tenders be invited from selected firms for t
supply of motor generators for the chargi
apparatus at the Fulham and Millwall fi
stations.

Working-class Dwellings.—In a report su
mitted by the Housing of the Working Class
Committee, dealing with working-class dw
lings built and demolished during the year 191
it was stated that for the second year there h
been a net decrease in working-class accomm
dation in the County of London. The Co
mittee report that the most important conc
sion suggested by the return for 1914 wou
appear to be that up to the outbreak of w
there was no indication of a revival in t
building of working-class houses in Grea
London. There is little doubt that the numb
of vacant houses and tenements suitable f
working-class occupation in the country, a
even in the extra-London districts, is now sma
while in some districts, such as Woolwich, the
is a shortage of accommodation.

*South-Eastern and London, Chatham, and Do
Railways Bill.*—The Parliamentary Committ
reported that instructions have been gi
for the renewal, in the House of Commo
of the Council's opposition to the South-East
and London, Chatham, and Dover Railways B
with the object of securing the rejection of t
power relating to Charing Cross Bridge.

◆

THE REPAVING OF PARK-LANE.

A difficulty has arisen in connection with t
proposal for the repaving of Park-lane. T
estimate for wood-paving, made in Decemb
allowed £7,800 for the work, but the low
tender received is for £10,403, or £2,603 m
than the estimate. The difference is due to
rise in the price of timber. There was, howe
a tender for asphalt paving at £6,636.

THE BUILDING TRADE.

ISEASES OF OCCUPATION AMONG PAINTERS AND PLUMBERS:

THE REMEDY.

WE have received the following letter from a correspondent to whose remarks reference is made on ge 414:—

SIR,—Your readers have noticed in the *ard of Trade Labour Gazette* a monthly port of Diseases of Occupations in Factories d Workshops—both cases and deaths.

" Cases include all attacks, fatal or otherwise, orted to the Home Office. . . . Deaths lude all fatal cases reported during the nth. . . .

" The total number of cases of poisoning . . reported to the Home Office under Factory and Workshop Act during April, 16, was fifty-two. . . . In addition, four ses of lead-poisoning (one of which was fatal) re reported among house-painters and mbers, but notification of these cases is not ligatory." Further: "There were thirty-one ses of lead-poisoning (including four deaths) ong house-painters and plumbers during first four months of 1916, compared with ty-three cases (including seventeen deaths) ring the corresponding period of 1915."

Now I wish to impress upon your readers at these figures do not indicate the total mber of cases that occurred, but only those ich were reported; "but notification of ese cases is not obligatory." And why, I y be asked, is the certifying surgeon under obligation to report to the Home Office those ses of lead-poisoning which occur among inters and plumbers? Because house-inters and plumbers, with few exceptions, not engaged in factories and workshops, nsequently they are unprotected, and not der the jurisdiction of the Factory and orkshop Act.

During four months, taking the average 1915 and 1916, there were 105 cases reported factories, including a total of seven deaths, between three and four deaths in each four nths. It is significant that during the me two periods, on the average, there were orted only thirty-seven cases among house-inters and plumbers, with a total of twenty-e, or an average of over ten deaths. From ese figures it would appear that in factories ly 3 per cent. of cases are fatal, but among use-painters and plumbers over 26 per cent. cases are fatal. Of course, such figures are isleading unless modified by the words, out notification of these cases is not obliga-ry," which words were added in the *Labour zette* for May, 1916, by the courtesy of the itor, consequent upon the writer protesting ainst the misleading tendency of the figures, themselves, previously published.

If now we accept the reports of fatal cases to and including April, 1916 (which are pplied by the Registrar-General), namely, enty-one deaths in eight months, and apply e same comparison of deaths to cases as in ctories—that is, seven deaths to 210 cases ring the same two periods—we must multiply e 210 by twenty-one and divide by seven. ne result is, of course, 630 cases, namely, e number of cases among house-painters d plumbers in eight months, instead of enty-four which were reported. I believe en 630 to be a grave under-estimate.

If now your readers procure the condensed eport of the Departmental Committee on the vils of Lead Compounds in Paint [Cd. 7882],* d turn to page 78, they will read as follows:—

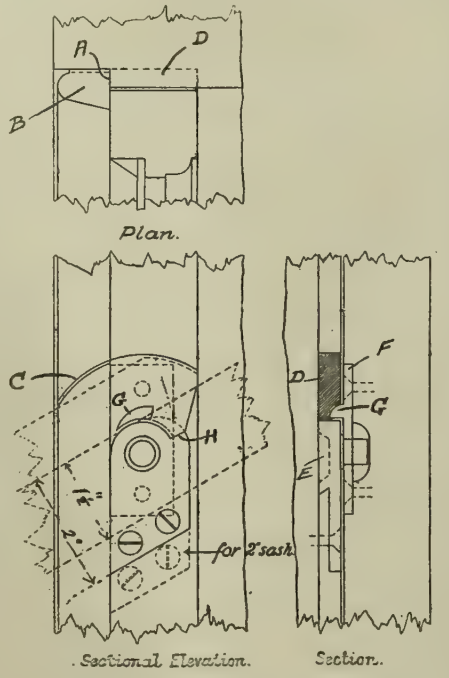
That in every 100 deaths which have occurred nong members of painters' societies between irteen and fourteen occurred from causes attributable to lead"; also, "that the average age at death, due to all causes in the painting industry, is no less than eight years younger than all males." Further, a critical medical examination of working painters, conducted in Chicago for the American Government, demonstrated that the average progeny of operative painters falls short by half of their ancestral average. Lead products are racial poisons! (*The American Journal of the Medical Sciences.* June, 1914. Pages 788-803. Philadelphia: Lea & Febiger. 2s. 6d. net.)

I have endeavoured to impress upon your readers the serious character and extent of the evil. Now for the remedy. And here let me say I have no personal ends to serve.

It has been proved by various service trials, extending over many years, on sea and land, that a durable fine white pigment serves every purpose, made from oxide of zinc, the base of which pigment is *hydrate of zinc* in chemical combination with oil. This has proved successful under conditions fatal to white-lead; and it is equal to red-lead for pointing and cementing and coating metal surfaces. Before, however, this beautiful pigment can be made commercially available the production of zinc oxide as well as zinc spelter must become a British industry; hence the importance of making arrangements for adequate supplies of Australian and other zinc ore or concentrates. Limitation of space forbids my going into further details, but I would urge the speedy provision of pigment to replace poisonous white-lead and red-lead in the national interest. PHILADELPHIAN.

AN IMPROVED WINDOW FITTING.

WE have received a specification and seen a model of an ingenious device for doing away with the unsightly arrangement of beads round centre-hung sashes, which has been provisionally protected (Provisional Patent No. 21,408) by Mr. J. Stanford, 25, Briscoe-buildings, Brixton-hill, S.W., and which we illustrate. The inside bead is done away with, the outside bead is fixed to frame and sash in the usual manner. A rebate A is formed of half the width of the bead, and a small pocket D formed in the frame concealed by the sash, which allows space for the upper end of the bead on the sash to move in when the sash is opened. The pivot consists of two parts—a plate E with a projecting pivot pin and plate F, a corresponding bearing to receive the pin, and a curved projecting stop G. E is rounded at the top and has a shoulder H, against which G stops to limit the opening movement.



Plan.

. Sectional Elevation.

Section.

An Improved Window Fitting.

We understand the invention has been tested and found to be watertight, and it certainly has a better appearance than the centre-hung sash as usually carried out.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Bedford.—Messrs. W. H. Allen, Son, & Co. have submitted to the R.D.C. plans for the erection of a building in the parish of Biddenham.

Bexhill.—Plans passed by the T.C.:—Four semi-detached houses in Cooden-drive (Mr. G. E. Maynard), Messrs. Piper & Sanders; hall and cinema, Marina (Mr. G. H. Gray), Messrs. H. Pulham & Co.; new porch and entrance to 2, Woodville-road (Mr. J. B. Wall), Mr. J. W. Webb.

Bradford.—The Bradford Health Committee has decided to recommend that a laundry, to be equipped with the plant now at Bierley Hall Hospital, should be provided at Grassington Sanatorium, and that to serve the whole of the remaining departments under the control of the Health Committee a central laundry should be provided at the disinfecting station, Canal-road. The City Architect has been instructed to prepare sketch plans and estimates for the work.

Burryport.—The Plans Committee has considered the plans for a new cinema near the Police Station

Chiswick.—The Licensing Justices have sanctioned plans for alterations at the Pack Horse and Talbot, High-road, Chiswick.

Coventry.—The City Council has approved the following plans:—Timber store, Carlton-road, for Messrs. B. Laird & Co.; additions to works, Smith-street, for T. Smith's Stamping Works, Ltd.; laboratory (amended), Cash's-lane, for the Standard Motor Company, Ltd.; store shed (site only amended), Upper York-street, for Alfred Herbert, Ltd.; factory (amended), Hawkins-road, for the Metallurgical Company, Ltd.; mess rooms, Radford Works, Daimler-road, for the Daimler Company, Ltd.; conversion of existing premises into picture theatre, corner of Cox-street and Ford-street, for Mr. E. Strong; mess-room, Drapers Field Works, Sandy-lane, for the Daimler Motor Company, Ltd.; motor house, rear of 45, Spencer-avenue, for Mr. E. N. Hillier; bacon store, etc., rear of 8, Cook-street, for Mr. R. P. T. Darlington; extension of machine shop, Edgewick Works, Canal-road, for Alfred Herbert, Ltd.; erecting shop, Broad-street, for the Condor Engineering Company, Ltd.; one house (rebuilt), Belvedere-road, for Mr. E. Mortiboy; bridge for cables over canal, opposite the Refuse Destructor Yard, for the Electric Light Committee; alteration to Nos. 412 and 414, Foleshill-road, for Messrs. Freeman, Hardy, & Willis, Ltd.; additions to premises, corner of Hastings-road and Brighton-street, for Messrs. Mitchells & Butlers, Ltd.; shop front, No. 33, Cross Cheaping, for Messrs. Hendry & Co.; six houses, Queen Mary's-road, for Mr. J. Clifton; four houses (two houses amended), and six garages, St. Andrew's-road, for Mr. T. F. Bird; one house, Collingwood-road, for Mr. H. Davis; extensions to laundry, Waveley-road, for Mr. W. Neal; lavatory extension, Northey-road, for Messrs. Webster & Bennett, Ltd.; locomotive shed, Radford Works, Daimler-road, for the Daimler Company, Ltd.; drainage to two houses, Crescent-avenue, for Mr. F. Smith. At a recent meeting of the City Council the expenditure of £1,575 by the Electric Light Committee on a scheme for

LAW REPORTS.

OFFICIAL REFEREE'S COURT.

(Before Mr. POLLOCK.)

The £97,000 Claim:

Spencer, Santo, & Co. *v.* Commissioners of H.M. Works and Public Buildings.

AFTER a week's adjournment owing to the indisposition of Mr. R. N. Patten, the chief witness in support of the plaintiffs' case, the hearing of this action was resumed on Monday, May 29, when Mr. Patten was recalled and further cross-examined by Sir R. Acland, K.C., after having already been in the witness box for nine days.

The witness was closely questioned during the whole of Monday, Tuesday, and Wednesday by Sir Reginald upon the details of the work, particularly in regard to the stone, iron, and concrete work, the alterations in which, it was alleged, had been prejudicial to the plaintiffs. As to the concrete work, he was unable to say what the cost per foot run was, in fact, although it was considerably more than the contract price, owing to the alterations in the plans. The stonework had been enhanced in cost by the largely increased number of stones used and the increased number of joints to be made in consequence.

OFFICIAL REFEREE'S COURT.

(May 23.)

(Before Mr. MUIR MACKENZIE.)

Alleged Breach of Repairing Covenant:

Amos *v.* Stewart and Others.

IN this action the plaintiff, the lessee, claimed possession from the tenants of 32, Grosvenor-terrace (formerly Brunswick-terrace), Camberwell, on the ground that there had been a breach of the repairing covenants of the lease.

Mr. Charles Church appeared for the plaintiff and Mr. Martin Brooke for the defendants.

Mr. Stewart was the actual occupier of the premises, which were also occupied by three other tenants, each of whom rented a floor, and they were all joined as defendants. The plaintiff was the holder of a lease from the ground landlord, and the claim for possession was against all the occupiers and as against a Mrs. Wilson, who was a sub-lessee for damages.

In the defence it was claimed that there had been a substantial compliance with the covenants of the lease in accordance with the notices served upon the tenants.

The Referee said, as to the law on the subject, that he proposed to inquire whether the covenants of the lease had been complied with, not whether the notices served upon the defendants had been complied with.

Mr. Church said that witnesses would be called to prove that, having examined the lease and the premises, notices had been served upon the tenants to put the place in repair in accordance with the terms of the lease.

Mr. William Grellier, F.R.I.B.A., architect, of Queen Anne's-gate, stated that he examined the premises on behalf of the freeholder in April, 1915, and he prepared a schedule of dilapidations, having present in his mind the scope and operation of the covenant to repair as contained in the lease. Having prepared the schedule, he sent it to the plaintiff, and did not have anything more to do with the property until April last, when he again visited the premises, and found that the notices served had not been complied with.

The Official Referee said that the repairs appeared to be trivial, and it was scarcely to have been expected that a gentleman of the position of the witness in the profession would have been called upon to make a schedule of them.

Witness added that when he visited the premises in April, 1916, he found that the work had not been done in accordance with the notices.

A large number of witnesses were called on both sides, amongst them being, for the plaintiff, Mr. Gordon H. Grellier, P.A.S.I., and Mr. L. Falkingbridge Parker, M.S.A., and for the defendants Mr. W. A. Head, P.A.S.I., and Mr. C. W. Horser, F.S.A.

The Official Referee, in giving judgment, said that Mrs. Wilson acquired a sub-lease of the premises in 1914, at which time it was in a dirty and dilapidated condition. She immediately put it in the hands of the builder and spent some £90 upon it. But immediately afterwards a surveyor inspected it for the freeholder, and sent to him a schedule of dilapidations. The plaintiff, who was an estate agent, and manager for the freeholder, passed the schedule on to the underlessee. From the evidence it appeared that Mrs. Wilson had kept the house in sufficient repair to comply with the covenants of the lease, and he therefore found that there had been no breach of covenant which would entitle plaintiff to possession. The action to turn the defendants out would therefore be dismissed with costs.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi.; Public Appointments, xviii; Auction Sales, xx. Certai conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bin themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be mad for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willin to submit tenders, may be sent in.

⁎ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while ever endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

June 9.—**Pocklington.**—Painting, etc.—Outside painting, etc., required at the Pocklington Grammar School, for the Governors. Specifications may be seen upon application to the Head Master on the school premises.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3828. JUNE 16, 1916.

THE PERIODIC TIDES OF STYLE.

ARCHITECTURE, though described by Ferguson as the history of civilisation written on stone, does not necessarily reflect the general progress of civilisation with exactness, rather following a course of its own influenced by contemporary ivilisation, but showing a tendency to ebb and flow from eriod to period. Civilisation, if judged from the broadest tandpoint of the diffusion of knowledge, humanitarian coneptions, and the increase of wealth of the community, does ot to any marked extent ebb and flow unless disturbed by ome world calamity in the shape of war or pestilence. In one ountry the manifestations of art show few signs of mutation hrough an epoch of something like four thousand years, for in gypt the work of the Ptolomies is closely similar to that of the haraohs, though in the later epoch the influence of Rome had ransformed the conditions of the ancient world. The spell of he East and the traditions of the past proved a barrier which tilled the waters which ran so strongly elsewhere, and the emples of Philæ and Edfou reflect a past rather than a conemporary stage in the world's history. Elsewhere the power f Rome and the conditions of Roman civilisation were tamped on the civilised world to a great extent regardless of ocal traditions, climate, or site. Nor did Roman architecture ndicate the gradual decay of a virile, hardy people, but showed hroughout its long history the same clear evidence of contructional ability and a masculine purpose. Many of the ater Roman buildings contain the germs of conceptions carried o fruition in the age of the Renaissance, but the vitiation of olitical and national life is by no means strongly marked in ny series of Roman buildings.

If we except from our survey Rome and Egypt, where rchitecture would seem to have been more unchanging than he civilisations of which it was an outcome, we are confronted ith the periodic waxing and waning of the " styles " for the ast nineteen hundred years, though in that period the nations of urope have been, with occasional set-backs, evolving a higher nd more complicated from a lower and more elementary stage f civilisation. After the long period when the struggles of urope to repair the disaster of the overthrow of the Roman mpire were fittingly expressed in Romanesque architecture, e have the amazing spectacle of the rapid growth, developnent, and decay of Gothic art, all comprised within a period f some three centuries, certainly the most astonishing in the hole history of æsthetic development. If architecture was parallel development to contemporary civilisation, we should xpect to see contemporary civilisation take some new form, s artistic expression did during those three centuries, but the istory of the countries in which it waxed, waned, and disppeared beneath the rising flood of the Renaissance exhibits o such sudden change. From the time of Henry II. to that f Henry VII. we were slowly progressing towards better hings, but the process was but part of that gradual rise from more primitive to a more complex civilisation which has one on for centuries. The Black Death which halved the opulation of Western Europe was marked in England and rance by a cessation of building which formed the starting-oint of the development of Perpendicular and Flamboyant rt; but the changed manner, noticeable as it was, is slight ompared with the influences unloosed by the Renaissance hroughout Europe.

Only in Italy, whose soil covered the ruins and remains of ncient Rome, and where the instincts of the people rendered he new change more of a reversion to a familiar type than an nnovation, was the movement anything less than a revoluionary one, but a revolution we should scarcely gather from the history of the times were our historic monuments effaced. And with every succeeding period since that of Elizabeth and James we have seen the tides of æsthetic feeling ebbing and flowing sometimes in one direction and sometimes in another, and yet all the time our people have been gradually winning their way towards the conditions of life now obtaining in the civilised world. And what can be said of the æsthetic conditions which have marked the last century, one in which we have opened the casket of the art treasures of centuries, an age in which we have acquired knowledge, but fail in the ability to build as our forefathers did when they produced the things of beauty which are " a joy for ever " ? Is the history of civilisation necessarily written on stone, or is it subject to tidal influences, which are things apart from civilisation, as the history of the world has partially demonstrated to us?

A study of every history of architecture written brings these questions freshly to our mind, and the last two volumes which complete Russell Sturgis's " History of Architecture " * suggest the same reflections. Mr. Frothingham brings to his task great knowledge and industry, but his books are perhaps happily more descriptive than analytical. We have heard the theorists on architecture of one age discounted in the next, and possibly the greatest service a writer can do is to encourage study by promoting enthusiasm rather than by explaining his own gospel to a world which may soon discard him in favour of a later prophet. For when Mr. Frothingham says, " It is unimportant to know who built a Gothic cathedral; it is the work rather of an era than a man. But it is absolutely imperative to know who built a Renaissance palace. Art biography is now to overshadow art history," he is using meaningless rhetoric. What is important in either case, if we can obtain it, is a knowledge of the intention and aims of the builder, and a Renaissance palace can be analysed as a work of architecture in precisely the same way that a Gothic cathedral can be.

That we study the biographies of the Renaissance architects is due to the fact that the information is available and interests the large body of those to whom the personal equation is always fascinating. The great and absorbing problem concerning mediæval architecture is the extent to which it was the outcome of a master mind and the degree to which it can be attributed to a republic of craft workers. The case for the independence of collective workers would seem, save in very early times, to be a slighter one than we have formerly been inclined to think, for we have numerous instances, like the spire of Ulm Cathedral,† finished in our times from drawings which have come down to us from the Middle Ages and Ratisbon, where there is evidence that the final design was a selection from several made in competition. These tend to make us think the necessity of direction was felt and acknowledged in the past as in the present. In another sentence we are told that " as inertia is much simpler in its manifestations than action, the forms and norms of the Renaissance were as simple and stable as those of Gothic were complex and fluid." We question whether a statement of this kind will pass muster with those who look through Mr. Frothingham's last volume and reflect on the amazing variety and complexity of the forms assumed by the Renaissance in different ages and countries.

---

* " A History of Architecture." Vols. I. and II., by Russell Sturgis, A.M., Ph.D. Vols. III. and IV., by A. L. Frothingham, late Professor of Archæology and the History of Art at Princeton University. (Doubleday, Page, & Co., Garden City, New York. 25s. each volume.)

† See our inset illustration this week.—ED.

Such argument is vitiated by the fact that it is based on the Gothic cathedral, not on Gothic architecture as a whole—that is to say, on a special type of building produced in the Middle Ages, and does not apply to other manifestations of architectural expression.

But the value of the work lies in its comprehensive scope, covering as it does the mediæval and Renaissance architecture of all Europe, and illustrated by nearly 900 illustrations. The immense difficulties of writing such a work appear to be fairly well met, but a survey of any history of architecture renders the reader more and more uncertain as to whether mankind's æsthetic development will ever enable us to reach firm standing-ground beyond the influence of that ebb and flow of style which is conterminous with the limits of European history if not with that of the world. We hope that such may be the case, but precedent hardly points in that direction.

◆

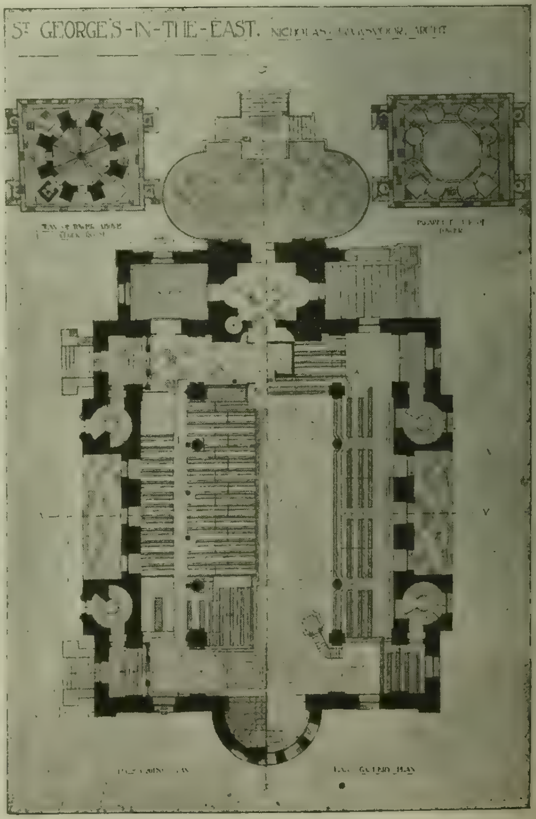
NOTES.

School of Oriental Studies, London Institution. THE King in Council has granted a Charter of Incorporation to the School of Oriental Studies, London Institution, and the Governing Body, of which Sir John Hewett has been appointed Chairman, is constituted. For purposes of the School the buildings of the London Institution in Finsbury-circus have been altered and adapted and a new wing has been added after the plans and designs of Professor F. M. Simpson, F.R.I.B.A., who acted as architect to a Departmental Committee of the India Office in conjunction with H.M.'s Office of Works. The Government Bill, promoted in May, 1912, provided for the vesting of the buildings in the Office of Works, compensation to the proprietors of the Institution, a grant of from £20,000 to £25,000 for alterations of the premises, and an annual subsidy of £4,000 in aid of maintenance. The Indian Government promised a similar grant of £1,250. The Institution was built in the then Amphitheatre, Moorfields, in 1819-20, after designs by Mr. William Brooks, who adapted the Corinthian portico from the Temple of Vesta at Tivoli; the laboratory was designed by W. H. Pepys, F.R.S. The library on the first floor was one of the finest after its kind in London.

Nonsuch Palace. THE sale in the current month of the Ewell Castle Estate embraces the ruins of Nonsuch Palace that stand in the grounds. The palace was begun in 1530 by Henry VIII., who used the materials of Merton Priory, and, for the site and park, appropriated all Cuddington parish, with its manor house and church; it was finished by Henry, Earl of Arundel, by grant of Queen Mary I. The plan comprised an outer or "lower" court, 150 ft. by 132 ft. within, and an inner or "upper" court, 137 ft. by 106 ft. within, upon a higher level; between the two courts was a three-storied gate of freestone having angle-turrets and a lead-covered clock tower; the lanterns of the two great south-eastern and south-western embattled towers were also covered with lead, and in the latter was a big leaden cistern, pipes from which served the whole house. The outer two-storied court was of freestone; the inner, containing the State-rooms, was for the most part timber-framed. The exterior walls were covered with bas-reliefs in plaster. Of that splendid structure, the "Nulla Ejusmodi," there are views by Hoefnagel (1582) in Braun and Hogenberg's "Urbium Præcipuarum Mundi Theatrum," and by J. Hondius (1610) in Speede's "Survey."* Hentzner, who visited England *temp.* Elizabeth, describes the palace and its no less remarkable gardens, with their "piramedes," "wash-boule," "perches" (for falcons), and "six leylack-trees"—the first lilac-trees seen in England. In the survey made for the Commonwealth the materials are valued at £7,020. The palace, which was settled upon the Queens Anne and Henrietta Maria, was bestowed by Charles II. upon Barbara, Duchess of Cleveland, who sold the materials, which became a quarry for Durdans and other houses at Epsom Wells. Thomas Calverley built Ewell Castle about 100 years ago, and Capt. Wiener, who recently bought the freehold, expended large sums in making the Japanese lake-gardens.

The Chelsea Physic Garden. THE Managing Committee have added the Physic Garden, Chelsea, to the list of London gardens which are now opened to our wounded soldiers. The garden was handed over in 1899 to the trustees of the London Parochial Charities Foundation, who contribute £800 yearly towards its maintenance as a field for the study of botany and vegetable physiology and the culture of medicinal plants. The garden, 3½ acres in extent, has its origin in the parcel of land near the old Swan Tavern in Paradise-row, which the Apothecaries' Company leased from Lord Cheyne in 1673 for their botanical and summer garden and barge-wharf. Sir Hans Sloane—who bought Chelsea Manor in 1712—conveyed it by deed, dated February 28, 1721-3, in trust to the Apothecaries. Eventually the Company, finding their resources were unequal to the charge, applied to the Charity Commissioners, who framed (1899) the scheme now in force. About £7,000 has since been expended upon new laboratories, greenhouses, curators' residences, and other buildings. Evelyn records his visit on August 7, 1685, "to see Mr. Wats, Keeper of the Apothecaries' Garden of Simples at Chelsea." Watts planted in 1683 the four cedar-trees—the first after their kind brought to England—of which the last survivor was finally cut away a few years ago. Phillip Miller, author of the "Gardener's Dictionary," was chief gardener and curator for nearly fifty years. The marble statue (1737) of Sir Hans Sloane is by Rybrach, to whom the Company paid £300 for the work.

The Education of the Public. ACCORDING to a verse which appears in an evening contemporary the Teddy-bear and other children's favourites claim exemption from military service for the "architect" of dolls' houses. One of our most distinguished architects was anxious to give his daughter elementary instruction in design *ab initio*, so he devised a doll's house according to architectural canons and had it made at considerable cost. But his daughter would have none of it and clamoured for the commercial article, with the result that her disappointed father came to the conclusion that mankind inherits not only original sin but original bad taste. Can anything show more clearly the want of education in architecture than the bestowal of the title architect on the makers of dolls' houses? We should like the law of the land to prohibit the sale of any doll's house or any Noah's ark which had not been designed by a member of the profession, and we should further agitate for the punishment of all those who made such designs for less than 5 per cent.! Only by some drastic measure of this kind can we hope to get things right at the outset, for the child is father to the man, and the disposition to accept the counterfeit for the real should be severely checked at once. We suggest the subject as one worthy of consideration to all those who are in authority in the kindergarten, if that somewhat Germanic word is still in use.



St. George's-in-the-East. (*See page* 433.)

HE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

XXXIX. — St. George's, Bloomsbury-Square.

HE church of St. George, Bloomsbury-
are, was one of those entrusted to Nicholas
wksmoor (or Hawksmore) on his appoint-
nt as first surveyor to the Commissioners
building new churches, in which he was associ-
l with J. James in 1716. The church is heavy
somewhat uninteresting, though it possesses
siderable dignity. The altar was originally
ed in the semicircular recess in the east
l, and it is probable that it was intended to
end the church eastward after the demolition
adjacent buildings; but the orientation of
building has been altered, the chancel being
ed at the northern end. The steeple
sesses merits, and was inspired by Pliny's
ription of the mausoleum of Halicarnassus.
vas to have been surmounted by a statue of
rge of Denmark, the consort of Queen
ne, but the figure placed there eventually is
lited with being a representation of our
ional saint. The church was erected
reen 1720-30.

No. XL.—St. George's-in-the-East.

t. George's-in-the-East, formerly called
pping, Stepney, was built between 1715-23
n the design of Nicholas Hawksmoor, and
ws the overwhelming tendency of the designer
dopt massive forms and proportions. The
is an unfortunate addition which is not
haracter with the rest of the design. Four
ets mark the subordinate entrances, but
most remarkable feature in the church is
singular termination of the tower. The *motif*
clever one, but it has been spoilt in execution
the defect of heaviness and want of grace
ch mar the architect's design. The church
estimated to cost £13,570, but actually
£18,557. An excellent set of measured
wings of it were reproduced in the *Builder*
lay 28, 1915.

CHARING CROSS RAILWAY BRIDGE.

In a letter to the *Observer* Sir Aston Webb, R.A., writes as follows in reference to Charing Cross Railway Bridge:—

"The Bill came before the House of Lords this spring, and was referred to a Committee of the House, with the Marquis of Bristol as Chairman, the House of Lords passing a resolution, moved by Lord Plymouth, that it be an instruction to the Committee to take into consideration the requirements of the traffic over the river at this point and the effect that this Bill, if passed, will have upon it, and to hear evidence from the Royal Institute of British Architects, the London Society, and others on the treatment generally of this very important part of London. This Committee has just held its inquiry; the Bill was opposed, amongst others, by the Port of London Authority, the London County Council, and, under the instruction to the Committee, by the Royal Institute of British Architects and the London Society. The case for the company was that the old bridge required strengthening in order to allow of an increased traffic, while the London County Council and others asked that the powers be not given until a reasonable time had been allowed for the responsible bodies to bring forward an alternative scheme. It was explained by the engineer to the company that the strengthening of the old half of the bridge was to be carried out by propping it up from the underside, and large drawings were exhibited showing the result of this treatment on the appearance of the bridge.

The principal witness for further consideration was Mr. John Burns, who said he looked upon the bridge and station as an abomination which should never have been permitted, and that he thought everyone, including the company, would welcome its disappearance to the southern side. His view was that we ought to have a new station on the Surrey side, with a new vehicular bridge of the finest description connecting the north with the Surrey side, and that the London County Council, the two adjoining borough councils, and possibly the City Corporation ought to co-operate in providing it, and whilst carrying out a great public improvement, not to the company's detriment, but for the benefit of London as a whole, the Thames might be relieved of that ugly red oxide behemoth that sprawls from north to south. If the Bill was postponed for two or three years he and others, he said, would do all in their power to get the various authorities concerned to consider their attitude towards an alternative to this bridge, and suggested that the London County Council should co-operate with the railway company at once in devising a more excellent way of a bridge here and a station on the Surrey side.

Another witness, Mr. Andrew Taylor, Chairman of the Improvements Committee of the London County Council, said that while, of course, he could not pledge his Council, his Improvements Committee and the Council were unanimous—there being no dissentient vote—in deciding to oppose this Bill, and therefore he would take it upon himself to bring the matter forward, so that he might get authority to communicate with all the bodies concerned, together, he hoped also, with the Government and the railway company itself. In his opinion the time is now much more ripe than it has ever been for devising such a scheme. All he asked was that he should have a reasonable time after the war to bring their scheme to a focus.

A third witness, Sir William H. Lever, said he felt merely as a business proposition it was an entire mistake to spend money on the Charing Cross Bridge, not only from the point of view of the public, but also of the railway company. Land on the south side of the river is bound to become more and more valuable and more difficult to acquire. The proper and economical way is for the company to acquire it at once. He was perfectly certain that it is impossible to have an adequate station for Continental traffic on the restricted site of 4 acres at Charing Cross, and in his opinion we were quite behindhand in station accommodation in this country. He felt that any money spent, large or small, in patching up the present bridge was practically futile. In his view it was essential to have another road bridge at this point. The congestion of traffic in London is accountable for the extraordinary high rates for cartage in London, which are at least three times that of the dearest town he knew of.

The only other witness called under the instruction was myself, though we had in attendance, and would have liked to call on the traffic and other requirements, Mr. Paul Waterhouse, who has made a speciality of this matter, also Professor Beresford Pite and Mr. Leonard Stokes, on behalf of the Westminster City Council.

In Mr. Paul Waterhouse's view the intention to strengthen Charing Cross Bridge as proposed is wholly to be condemned. During its entire existence it has been an acknowledged blemish and is a definite and appreciable discount to the worth of our town. He considers the removal of the station and bridge inevitable, and that the congested state of the existing road bridges demands a vehicular and foot traffic bridge at this point. The inefficient gangway attached to the north-east side of the bridge is itself an anachronism and calls for reform, and the narrow footway and make-shift staircases should not be tolerated.

Professor Pite, of the Royal College of Art, holds similar views. He points out that a public bridge at this point would shorten the distance from Trafalgar-square to Waterloo by more than a third of the present distance by roadway, and that the north and south sides of London at its heart are separated by a great and exceptional length of unbridged river, that their retention of the present railway bridge makes such a junction of the north and south impossible, and that any money spent upon rendering permanent a structure which prevents the economic development of the south side is money badly spent.

In his opinion the bridge discredits its unique position and is an architectural disgrace to London, and does no honour to engineering design. He quotes Mr. A. J. Balfour, who on May 2, 1892, speaking at a Royal Academy banquet, said:—"I never walk along the Thames Embankment and study the proportions of Charing Cross Railway Station and the bridge which is appended thereto without feeling how monstrous it is that such things should be allowed and that there should be no power of dealing with them."

In my own evidence I urged similar views, that the bridge and station were entirely unworthy of their position, very unsightly and so poorly designed that the station roof has already fallen down, and a large sum is now asked for in order to strengthen one-half of the bridge. It seems impossible to make anything worthy of the present structure by patching it, and it is certain that no worthy improvements can take place at this most important point if the present bridge is retained, as it certainly will be if a large sum of money is now expended upon it.

I gave it as my opinion that a new road bridge at this point is essential, and that it would be an immense advantage. The Chairman of the Committee said he thought they were all agreed upon that, and he did not think there could be any question about it, and Lord Grimthorpe, another member of the Committee, said, "I think we should all like to abolish the bridge if we could." A suggestion for a new bridge prepared by Mr. Niven and Mr. Raffles Davison can now be seen at the Royal Academy.

In the end, however, their lordships passed the preamble of the Bill, and London is again threatened, unless it rouses itself at once with a renewed life, for this "oxide behemoth" is a permanent hindrance to all improvement in this the very eye and centre of London."

THE OPEN SPACES OF LONDON.

Mr. A. F. Buxton (Chairman of the London County Council) presided over a meeting of the London Society, held at the Royal Society of Arts, on June 7, when Mr. Lawrence Chubb gave a lantern lecture on "The Open Spaces of London—Past, Present, and Future."

The Chairman said it was remarkable what a development of feeling there had been within the memory of most of them with regard to open spaces in London. If they looked back thirty years, nobody cared very much about open spaces. They had got Hyde Park and Victoria Park, which was mostly a swamp, but still it was good enough, they thought. Then there came along the idea of opening some of the graveyards, which was an important development. The London County Council took the matter up and did some good work, but he doubted if London was yet fully alive to the immense importance of open spaces. The superintendent of one of their lunatic asylums told him it was his strong opinion that the development of open spaces in London had had an actual effect in the reduction of lunacy.

Mr. Lawrence Chubb said in Tudor times the pulse of growing London was gradually bursting through the narrow confines of the City wall, and an early view showed the old church of St. Paul looking out over the City at its feet beyond the ramparts to the green fields stretching away to the northern heights of Hampstead. Along the river, towards Westminster, a narrow ribbon of mansions and palaces was making an appearance, and here and there a church betrayed the first steps towards expansion. To check this unseemly growth Queen Elizabeth, by Proclamation, charged all persons to desist from the building of any houses within three miles of the gates of the City where no former house had been known to have been in the memory of such as were then living. In 1656 an Act was passed preventing the erection of houses within ten miles of the City; but the Act was more honoured in the breach than in the observance, for by 1700 the population of Greater London—extending to Uxbridge and Staines and Twickenham—had swollen to nearly three-quarters of a million. By 1800 the population had grown to a million, and Londoners must have needed facilities for healthful recreation. Their wants were supplied in the first place by the Royal parks—Hyde Park, St. James's Park, and Green Park—which had emerged out of the misfortunes of the monks of Westminster, forced by Henry VIII. upon the dissolution of the monasteries to surrender the greater part of their possessions. In the time of the Commonwealth Hyde Park had a narrow escape. It was sold by auction, and the most important part was sold to Anthony Dean for
£9,020. John Evelyn in his Diary complain
of the sordid fellow who had purchased it
the State charging a shilling for every coa
and sixpence for every horse using the Par
After the Restoration the parks came aga
into the hands of the Sovereign, and a conside
able area was appropriated by William I
to form the private grounds of Kensingt
Palace, much of which had happily been throw
open again as Kensington Palace Garden
Next in importance came the commons, whe
the humbler folk took their recreation, a
which rendered almost unnecessary t
provision of other open spaces. St. Leonard
Shoreditch, Hackney, Hornsey, Islingto
Kensington, St. George's-in-the-East, St. Gile
in-the-Fields, St. Giles Without, and St. Martin
in-the-Fields on the north side all had the
commons, whilst had the girdle of commo
on the south survived there would have bee
little need of an open-space movement f
London, and the local authorities would ha
been spared a vast expenditure. In additi
to the Royal parks and the commons the
existed village greens and butts, whilst the
were numerous privately-owned pleasu
gardens and wells, which attracted vast a
fashionable crowds. Of the gardens attache
to institutions of various kinds they had happi
retained as welcome lungs the grounds of t
Charterhouse, of the Foundling and Chels
Hospitals, and of the various Inns. T
public playgrounds of the present day mig
be classified in the following order:—(*a*) Roy
parks; (*b*) commons; (*c*) parks, recreati
grounds, ornamental gardens, and gymnasia
(*d*) disused burial grounds; and (*e*) squa
gardens. These breathing-spaces were inde
a goodly heritage, for in the Metropolit
Police district they comprised an area
approximately 25,000 acres. In London prop
—that was within the district controlled
the London County Council—the open spac
under the control of the local authoriti
amounted to 6,665 acres, or one acre of ope
space to every 678 inhabitants. When th
Royal parks were added the area was 8,16
acres. Perhaps the most striking point
connection with the movement was the fa
that practically none of the 575 open spac
dedicated to the public use and enjoyment
Greater London existed as such 100 years ag
It was true the public resorted to the common
but in the view of the law courts they we
there as trespassers, and the user for centuri
of Stockwell Green for the playing of games d
not suffice to save that land from falling int
the hands of the building speculator. By th
middle of the nineteenth century the soci
needs of the community began to receive th
earnest attention of reformers, and the nee
for the provision of recreation grounds becam
urgent. Battersea Park was formed in 184
upon arable common fields; Kennington Par
was laid out in 1848 on the remnants of th
common. The old Metropolitan Board
Works acted in 1857 to secure the preservatio
of Finsbury Park, and again in 1863 to acqui
Southwark Park; and in the meantime th
Office of Works applied the proceeds of th
sale of York House for the formation of Victori
Park. Mr. Chubb proceeded to explain ho
the serious attacks being made on metropolita
commons by the action of lords of the vario
manors under Enclosure Acts led to a Parlia
mentary Committee being appointed, whic
reported against the enclosure of any mor
commons being allowed. In the meantime th
lords of the manors discovered the existence
the Statute of Merton, passed by the Barons i
1235, which allowed the lord to enclose th
common lands of his manor, provided he lef
sufficient to supply the needs of the freehol
commoners, and relying on this statute the
commenced on every hand to fence th
commons in. This led to the establishmen
in 1865 of the Commons and Footpaths Preser
vation Society, and its history was a record
triumphant success under the direction
Lord Eversley. Mr. Chubb gave some ver
interesting details of the fights waged by th
Society in regard to Hampstead Heath, Tootin
Graveney Common, Wimbledon Common
Wandsworth Common, Epping Forest, an
other open spaces. The general results of th
movement were remarkable, for whereas i
1865 some 16,320 acres of common land existe

the police district, only about 200 acres had ›ome private property. The lecturer next ıched on the small playgrounds for children ich had been secured, and on the valuable rk of the Kyrle Society in regard to disused rial grounds, and the very successful efforts of Metropolitan Public Gardens Association, ınded by the Earl of Meath. But whilst ıch had been done no one would assert that work should cease. London was growing in ry direction, and what was required was an elligent anticipation of future needs in order ıt open spaces should be secured when the ce of land was relatively low. A beginning l been made in this direction by the National ıst, which was gradually acquiring by rchase or gift hill-tops in Kent and downs l commons in Surrey. Perhaps it was not soon to suggest the possibility of local ıemes for saving scenes of natural beauty as morials of our fallen heroes. As future open ıces he would like to see saved the banks every stream within reach. Another open ıce could be secured by the realisation of dream of the London Society, which ualised a fine embankment along the ıthern side of the Thames. Shooter's Hill, oolwich, with its glorious woods and magnifiıt views, should be saved from the builder; big open space should be provided between xley and London; and beyond Croydon, ldington Hills could be largely extended with vantage. Large reservations of this kind uld not remove the necessity of providing en spaces in every growing town around ndon, and he looked to the Town Planning t to assist in the preservation of such sites.

A short discussion followed.

CORRESPONDENCE.

Married Architects and Enlistment.

Sir,—My son, who is adjutant of the 23rd ttalion London Regiment, writes to me from ance to say that his commanding officer is ry pleased to hear that married architects ve been invited to enlist in this battalion d that they may be sure of a hearty welcome ould they come to France.

Ernest Newton.

The Adam Manner.

Sir,—In the article "The Adam Manner" sue of May 12) I read some hard words which Italian artist will read without resentment.

You write:—"They go on to explain how appropriate the repetition of classical detail ay be if applied without due discrimination to its place and position.

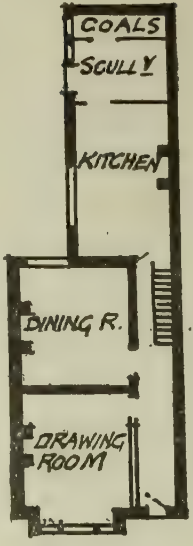
"Such absurd compositions, they added, ook their rise in Italy under the first of eir modern masters,' who unintelligently ed classical detail without considering its plicability."

I think that under these words you denote e Baroque style (am I wrong ?), which, owing the capricious movements of its lines and hness of ornaments, has never been mpathetic for the austere and frigid minds of ıglish artists.

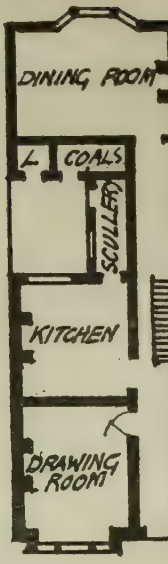
Allow me to ask: If the first of our masters the eighteenth century (who is this ?) is conlered unintelligent in artistic creations, which ord will you use to denote all our artists of e eighteenth century, and especially Invarra, rnardino, Vittoria, Alberti, Vanvitelli, ıgliafichi, Andrea Tirali, Ferdinando Fuga, d others, who have done artistic works as e façades of S. Cristina, Basilica di Superga, Francesco d'Assisi, and S. Teresa in Turin, e "Chiesa dell' Annunziata" in Naples, the eat staircase of the "Palazzo Reale" in serta and of the "Palazzo Durazzo" in enoa, the monument of S. Giov. and Paolo in enice, and the enlargement of the Corsini lace in Rome? All these works are of Baroque yle, and in their creation our artists have monstrated a great richness of invention, d have happily solved many difficult conructional problems. You do not like this yle—that is well known; but, as artists, ve you the right to disparage the artists who ve adopted it? I think not!

It is through the criticism that art is developg when unfairness and acridness are banished.

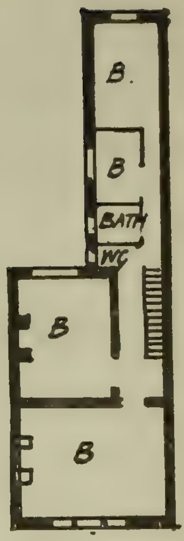
A. Brandani.



GROUND FLOOR



GROUND FLOOR AS IMPROVED



FIRST FLOOR UNALTERED

The Rebuilding of Sackville-Street, Dublin.

Sir,—It can scarcely be other than impliedly that to evolution belongs the principle of automatic segregation upon which you formulate your theory of "Comprehensive Street Design" and its involved methods and procedure in the relative architectural designing and extension of the powers and duties of local authorities to the heights and materials of street frontages. Thus the whole conditions which you contend for arise within cities in the progress of time and their respective growths and can never have a universal and very rarely a considerable application. Evidence is borne of this not having arisen in any very wide way in Dublin by the following, which I take to be editorial remarks, in last Saturday's issue of your old-established local technical contemporary the *Irish Builder and Engineer* in connection with Sackville-street:—

"It is clear that if a list of traders and sites were properly tabulated it would be found that a considerable proportion of firms are by no means wedded to Sackville-street either by choice or necessity. . . . A further point is that many of the traders set very little store by the upper portions of their premises, which are chiefly valued only for the shop frontages. The first floors are mostly let at comparatively moderate rents to solicitors, milliners, and others. The upper floors commanded very poor rents. This shows that the traders' requirements could be largely met by the provision of shops, the upper stories forming important public buildings, or rather the elevation would be a public building with shops on the ground floor."

Thus the facts and the ideas founded on them for the future do not correspond in the minds of your contemporary and yourself. And whilst I agree as to the present with him to an extent which displaces your theory in regard to local application, I take the liberty of looking upon your difference as to the future as strongly tending to show that the proper, which indeed I believe is also, broadly speaking, the inevitable, course is the return as regards Sackville-street and its businesses to be an almost complete return to the *status quo*.

But even this will be very difficult of achievement unless the financial benefits to be given by the State will be on the lavish lines which the circumstances and justice demand, and not upon the parsimonious principles for which the Government seem to be steering. If London through its institutional and Press organs of public opinion would accept this position it would no doubt greatly assist in untying the purse-strings of the Treasury.

If this financial issue didn't throw everything else into the background I'd like to discuss your views as to Nelson's Pillar.

A Suburban Dubliner.

The Terrace Villa.

Sir,—Just now, when a general revision of our ideas with regard to many subjects is being effected, it may not be amiss to consider whether in the case of the suburban villa of the commonest type the space available is used to the best possible advantage, and whether the rooms are so disposed as to catch the greatest amount of daylight. One would say that the existing type had probably been designed by some wealthy architect who would never have to live in one himself. I happen to live in such a one, which is better designed than most I have come across. In my experience, however, the most objectionable feature of this kind of house is the bay of brickwork at the rear. One of my principal sitting-rooms looks on to gloomy brick-walls, and when my neighbour lights his kitchen fire the smoke blows into my rooms, and *vice versâ*. By a rearrangement of the ground-floor plan, as shown, these inconveniences would be avoided, and it would also be possible to have in a small house a good-sized room looking direct on to the garden, and free, moreover, from the sometimes unwelcome observation of one's neighbours. Even the smallest garden judiciously planned could become a pleasing adjunct to this room and independent of any adjacent ugliness.

A Householder.

FIFTY YEARS AGO.

Revolving Venetian Shutters.

An arrangement of iron shutters has been patented by Messrs. Bunnett & Co., which affords thorough ventilation and shade, combined with the perfect security of a revolving iron shutter. The laths are made in iron and wood, flat, rounded, or curvilinear, as required; but, instead of the hinges being fastened by rivets or screws on the back of laths, they form continuous bands from the roller, on which the shutter coils to the bottom, and by which the shutter is made to lower. The top edge of each lath is connected at intervals by means of flaps to the continuous bands of hinges, leaving the lower edge of the lath free to be raised or lowered as may be required. Each lath is fastened to the one immediately above it by means of points working on a centre fitted to the end of each lath at its lower edge. By an easy contrivance the grooves in which the shutters ascend and descend are thrown open, and allow the shutter to take the shape of a venetian blind.

[⁂ From the *Builder* of June 16, 1866.—Ed.]

GENERAL NEWS.

Town Planning in South Birmingham.

Now that the Town-Planning Committee of the Birmingham City Council have completed their tentative proposals for planning the South Birmingham area, notice has been given that the draft map showing the proposals can be inspected at the Council House by owners of the land in the area or their representatives.

Church, Broadstairs.

The consecration of the new building, Christ Church, Broadstairs, was performed recently. The church accommodates over 300 persons, and has a vestry and parish-room attached. The architect of the church is Mr. A. Alban H. Scott, of Lincoln's Inn, London. The building has been constructed by Mr. J. T. May and the electric lighting installed by Mr. Vernon Hill.

The National Gallery.

Sir Charles Holroyd has completed ten years' service as Director of the National Gallery, to which he was appointed in 1906 for five years. At that time the Directorship had been vacant since the resignation of Sir Edward Poynter some eighteen months earlier. In June, 1911, he was reappointed Director for a second term of five years. It is stated that he is in bad health and that in consequence he is unlikely to seek a further extension of his Directorship.

Lord d'Abernon, presiding at the annual meeting of the National Arts Collection Fund, said that he had long been impressed by the fact that while the National Gallery was splendidly representative of all the great foreign schools, particularly of the Dutch, the Flemish, and the Italian, our representatives of English schools were in some departments singularly defective. The earlier periods of English painting were almost unrepresented.

The Italian War Exhibition.

Thursday, June 22, is the date now arranged for the opening of the exhibition of war pictures and cartoons by Italian artists at the Leicester Galleries. In addition to the series of paintings of the Italian war zone by the artist, Ludovico Pogliaghi, who went to the Alps with the direct authority of the Government, there will be many other features. For the first time in England will be shown a collection of original drawings by Galantara (sometimes known as Rata Langa), whose influence as a cartoonist, it is said, is so widespread in Italy that he has for long been recognised as a strong political force and a valuable asset to the cause of the Allies. Another artist whose work will arouse enthusiasm among the discriminating is Sacchetti. Many of the leading Italian artists have made drawings specially for this exhibition. There is, for instance, a series of paintings dealing with the tragedy of Nurse Cavell by Corbella, one of the most popular artists in Rome.

Liverpool Architectural Society.

An outing was enjoyed by members of the Liverpool Architectural Society on June 3, when by the invitation of Mr. T. T. Rees, the architect of the buildings, they paid a visit to the North Wales sanatorium in Denbighshire. The party was headed by Mr. Percy Hinde, the President of the Society, and Mr. Richard Holt, the Hon. Secretary, and included the Mayor of Birkenhead (Mr. James Merritt), the contractor for the buildings, and the Mayor of Wallasey (Mr. Sidney Dawson). The visitors found the new institution, which is to form part of Wales's memorial to the late King Edward VII., in a state approaching completion. Accommodation is provided for 220 patients, men, women, and children, and later this will be extended to provide for 250 persons. Bacteriological and disinfecting facilities are provided, and one block will be set apart for cases requiring surgical treatment. The completed scheme will cost about £40,000. Attached to the institution is a farm of about 250 acres, presented by Mr. D. S. Davies, of Denbigh, and a part of the scheme is the rebuilding of the farm buildings on model lines.

1st London Engineer Volunteer Corps.

The 1st London Engineer Volunteer Corps has been formed by the amalgamation of the E.I.V.E. Corps with the 4th Battalion Central London Regiment (Architects' Corps) and the L.C.C. Training Corps. The three corps have now, in accordance with the wish of General Sir O'Moore Creagh, become an engineer corps; with the exception of the Post Office Engineering Volunteer Training Corps (which is composed of civil servants), it is the only engineering corps in the metropolitan area. Full information with regard to the above corps can be obtained from the Adjutant, Chester House, Eccleston-place, Victoria, S.W.

Organisation of British Engineering Industry.

The following resolutions were carried at the general meeting of the Council for the Organisation of British Engineering Industry (Manufacturing Engineering Concerns Section) on June 6:—

"(1) That this meeting approves the steps taken to organise British Engineering Industry by the Council appointed on December 6, 1915.

(2) That this meeting approves the formation of an Association on the lines advocated in the Memorandum circulated, with power to negotiate, and if advisable to amalgamate or combine with existing or projected Associations; and this meeting pledges itself to support such an organisation.

(3) That those firms who by signing the card have promised their adhesion and support to the organisation be asked to subscribe to the funds of the new Association, and to make forthwith a minimum payment of £5 on account of their first year's subscription towards preliminary expenses.

(4) That the existing Committee be empowered to give effect to the resolutions passed at this meeting."

Norwich Union Fire Insurance Society, Ltd.

In presenting the 118th Report of the Norwich Union Fire Insurance Society, Ltd., to the annual general meeting, held at the Head Office, Surrey-street, Norwich, on the 6th inst., the Chairman (Major Cubitt) reported satisfactory results in all departments. The premium income from the various branches of business reached a total of £1,798,280. In the Fire Department, in which the premiums amounted to £1,188,766, the losses paid and outstanding were £600,663, and after payment of all expenses and commission and strengthening the reserve by the addition of £75,688 there remained the sum of £108,046 to transfer to the profit and loss account. The accident premium income, standing at £467,473 showed a substantial increase, whilst the claims paid were £244,031. In the profit and loss account the first item is £168,120, being the balance brought forward from last year; there is also to its credit £99,794 interest on investments and £161,519 trading profit, which, with transfer fees, £31, makes a total of £429,465. After making the usual payments, the directors were enabled to set on one side an Investment Reserve and War Contingency Fund of £200,000, and also to recommend an increase in the dividend of 3s. per share, making the amount payable for the year 1915 35s. per share less income-tax. The balance sheet shows the total assets to be £3,045,472.

Excavations in the Island of Tiree.

Under the direction of a member of t Antiquarian Society of Scotland, excavatic are now being conducted at the undergrou dwellings recently discovered at Kilkennet in the island of Tiree.

Wargrave Church.

Wargrave Church, which was burnt do by suffragettes on Whit-Monday, 1914, h been rebuilt at a cost of over £13,000. In t course of the rebuilding various architectu discoveries have been made, including fragme of a thirteenth-century doorway.

The Whistler Memorial.

Inquiries having been made regarding t memorial to J. McN. Whistler by M. Augu Rodin, organised by the International Socie of Sculptors, Painters, and Gravers, t Committee of the memorial state that in h last letter, dated April 13, M. Rodin said th the memorial was almost finished when t war broke out, since when he had not work at it. It would be the first thing he wou do as soon as he had a little more time. Rodin added that he could not give a rep to the subscribers at the moment, but th six months after the end of the war t monument should be ready for London, least six months being required for casti the bronze. The Committee also state th the entire sum subscribed for the memorial h been collected, invested, and placed in t hands of trustees.

The Aerial Wagon.

A correspondent has called our attentio to illustrations in our issue of April 1, 1843, which we described an inventor's proposal f a "steam-driven air carriage." The illustra tions which we then gave, one of which w reproduce, bear a considerable similarity t the modern aeroplane. The ambition to f has been one which has inspired the effort of inventors for many centuries, but it probable that most of us even twenty yea ago would have doubted its ever being succes fully achieved. During the last thirty yea greater progress has been made in practic scientific discovery than was ever made in an like period of the world's history. The su marine was foreshadowed by Jules Verne i "Twenty Thousand Leagues under the Sea, and we have in the present war seen what i capabilities for destruction are. Wirele telegraphy, the discoveries of X-rays an radium would have seemed to former ag to appertain to black magic, nor can we sa that we may not live to see a future in whic all these things have become commo place in comparison with the new wonde which scientific research may reveal to u Those who have experimented with flyi in the past have generally based their ide on the navigable balloon rather than th "heavier-than-air machine," shown i our illustration, which only reached actu accomplishment when the discovery and manu facture of petrol gave us a new means producing energy, which has proved infinite more manageable than steam. The invent of the aeronautic contrivance illustrated wa a Mr. Henson.

ILLUSTRATIONS.

Leadenhall-Street Premises.

MESSRS. TREHEARNE & NORMAN'S design shows the proposed treatment for the major portion of the widening of Leadenhall-street, which has already been arranged. The frontage treated is for a length of about 195 ft. Unfortunately it has not yet been possible to commence building operations owing to the war.

The design is for a Portland stone front with metal casements, and when carried out will probably be one of the largest conceptions dealt with in the City of London in recent years.

The Churches of the Later English Renaissance.

OUR illustrations are of two churches by Nicholas Hawksmoor—St. George, Bloomsbury-square, illustrated by scale drawings made by Mr. Fitzroy Doll, F.R.I.B.A., under whose supervision the church was altered and decorated in 1897, and St. George-in-the-East. Both are referred to in our article on page 433.

The North-Western Polytechnic.

THE whole of our inset illustrations for June 2 were given up to this important scheme. Tenders were delivered for the erection of the building within a few weeks of the commencement of the war, that of Messrs. Dove Brothers being the lowest; and, moreover, the tender was of an amount not exceeding the margin allowed upon the estimate.

All question of proceeding with the building when war broke out was shelved, and the matter now stands indefinitely postponed.

The illustrations are taken from the working drawings, which, we understand, have been prepared so as to ensure rapid progress when work is started. Considerable forethought has been taken down to the smallest detail, so that alteration during the progress of the building or variation of any kind will be unnecessary.

The building generally will be of mixed colour brick facings upon a Portland stone base, with the smallest "peggies" of rough green Westmorland slates as roof.

Windows are steel, floors fire-resisting, with special precautions to make them as sound-proof as possible. Walls are glazed in staircases and passages. Ventilation is by suction into large flues over the corridor ceilings, the pull being provided by the boiler flues. The accommodation is upon a very much larger scale than was contemplated when the scheme was propounded. Other schools have been incorporated, a large assembly hall added, and very considerable accommodation added for recreative purposes.

The advice and guidance as to the arrangement of the building given by the various authorities concerned have been extraordinarily helpful, and the scheme as it now stands embodies the very best expert opinion, and is believed to be one which will receive the approval of all those interested in the promotion of polytechnic work.

The design was chosen in competition, and, though the building has been considerably enlarged, it does not materially differ from the design originally submitted. The architect is Mr. Arnold Mitchell, of 17, Hanover-square, W.

"Mancroft Towers," Suffolk.

THIS building, the residence of Colonel Philip Back, was an attempt to plan and design a house in the style of the old red brick Tudor manor houses to be found in this neighbourhood. A feature in the plan is the long gallery extending from the five-light window over the porch, seen in the view, quite through the building, and terminating at a window in the tower. The higher bay and central windows seen light the hall.

Situated on a slight spur and commanding extensive views over the low-lying marsh lands to the south, west, and north, the tower naturally suggested itself, and now it is built becomes a landmark. Oulton Broad lies handily to the south. The whole of the exterior is in red brickwork except the roofs, which are covered with tiles, and the windows are all lead glazed. Mr. Young, of Norwich, was the general contractor. The building was designed by Mr. George J. Skipper, F.R.I.B.A., architect, Norwich. who also is the author of the drawing we reproduce.

Blackford Church, Somerset.

IT is proposed to erect a screen and rood loft gallery at this church, which will be the gift of the Rev. C. F. Haines. vicar, and it will probably be installed within the next two or three years, the lower portion being undertaken shortly. The work will be executed in selected oak by Messrs. R. L. Boulton & Sons, of Cheltenham, from designs and drawings by Mr. F. Bligh Bond, F.R.I.B.A., architect, Glastonbury.

Ulm Cathedral.

WE illustrate the west front of Ulm Cathedral, which has been completed in accordance with a design made in the Middle Ages. Ulm has the distinction of possessing the highest tower in the world (excepting the Eiffel Tower), which exceeds 500 ft. in height.

A Baroque Mirror.

THIS illustration shows an interesting piece of Baroque furniture from an Austrian Church.

MASK IN BLACK MARBLE.

THIS mask in Belgian black marble on dark red marble base was carved direct by me without the aid of a model of any kind, and not in the usual manner by "pointing" from a plaster cast. The material is extremely treacherous and as hard as granite; in carving, pieces pluck out without warning.

The material takes a good polish on account of its hardness. RICHARD GARBE.

THE DESIGN AND CONSTRUCTION OF COW-HOUSE

By J. M. W. Halley, F.R.I.B.A.

In an admirable pamphlet published by the Board of Agriculture and Fisheries on the subject of cow-houses it is written that "it is comparatively easy to provide new buildings which will meet all requirements at a moderate cost."

Cost, however, has very little to do with "requirements" beyond the very elementary and exiguous one of sound construction. Once you have secured this—and without it all one's efforts are wasted—the rest is a matter of careful thought.

At the outset it may be as well to say that sound construction is not synonymous with costly construction. In its kind a wooden construction may be as sound as one of brick or stone. It will be obvious to anyone that "sweetness and light," qualities that should appertain very closely to cow-houses, do not cost a great deal of money. The pamphlet to which I have referred above states that "it is much more difficult to alter an existing building so that it can be made as suitable as a new one." This is true; but if an old cow-stable is sufficiently wide, if it takes two rows of cows, it is very easily susceptible of remodelling. What is rather difficult to change is the relative position of buildings, the relation between the cow-house, root and chaff house, mixing, milk-room, dung pit and urine tank (the latter, usually being conspicuous by its absence, does not offer much difficulty). Each farm offers a different problem and requires a different solution, so that it is impossible to lay down laws to govern every contingency. It will be of most use if I treat merely of the remodelling of the cow-house itself without treating of the subsidiary buildings. But first let me speak of a new building, designed expressly to house cows in the most economical and scientific way.

The most durable kind of wall for any building is one of stone or brick. In Scotland a stone wall of about 21 in. thick would probably be cheaper than a brick one, but in most parts of England brick is the cheaper material. The usual English 9-in. brick wall, however, is neither good for man nor beast, and should never be used. It is very porous and is always damp. It is much better, and adds very little to the cost, to build a wall with a cavity. The usual practice (when a cavity wall is used) is to build two 4½-in. walls with a space between of 2 in. A wall built in this manner is drier and warmer than a 14-in. solid brick wall. To increase further the efficiency of this hollow wall some time ago I built a cow-stable with a 4-in. cavity; the larger body of air acts as an excellent insulator, preventing the heat from passing out or the wet and cold from passing in. For a small building I should not have the slightest hesitation in using a patent brick 4½ in. thick for the outside walls. It will be seen from the diagram (Fig. 1) that for a considerable part of its area it is hollow, and consequently makes a warm and a dry wall. The joints between the bricks are, of course, a source of weakness, but this can be remedied by covering the outside with a thin coating of cement and sand. Indeed in a sheltered situation I should be content to treat the walls with a coating of tar, a covering easily renewable by the farmer himself at an insignificant cost.

The use of this brick, it may be said in passing, offers a solution of the problem of the housing of the labouring man, for with it it is possible to build for £150 a cottage containing three bedrooms, living-room, scullery, and earth closet.

A wall—it matters not of what material it is built—must have a damp-proof course near its—base, some 6 in. above the ground, to prevent the damp from rising into the wall. This may consist of two courses of slate bedded in cement, or any one of the numerous bituminous preparations in the form of sheets which can be cut to any size and laid easily and cheaply.

The common form of roof is constructed of a series of heavy principals placed about 10 ft. apart, on which rest purlins, which again carry the rafters. Now a roof of this sort exercises a considerable pressure on the walls where each principal rests, and consequently a buttress is required under each—a method much more costly than building a hollow wall without buttresses. It is quite possible to build a roof in a simple manner, in such a way that its weight is distributed between the walls and internal wooden posts. These posts, besides carrying a share of the weight of the roof, can be arranged to come in the cows' standing-place, and in the absence of stall divisions helps to keep the cows straight in their places. They can be spaced 6 ft., 9 ft., or 12 ft. apart, accommodating two, three, or four cows. The section of cow-houses (Figs. 2 and 3) shows details of this sort of roof.

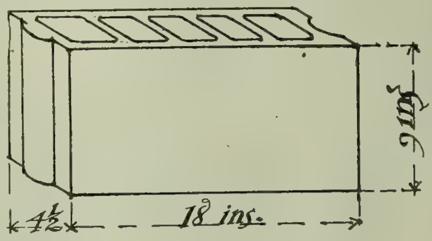

Fig. 1.

The cheapest form of roof covering is corrugated galvanised-iron. It is unnecessary when using this material to make the slope of the roof as steep as when employing tiles or slates, as it can be laid as flat as 20 deg. from
the horizontal, whereas tiles should no
laid at a less slope than 45 deg., and slates
pitch not less than 30 deg. (Fig. 3).
proper attention an iron roof can be
to last forty years. The first care is to o
good material, and then, after the first
have washed out the acid used in the galvan
process, to give it two coats of silica gra
paint. This paint will last for ten years.

The inside of an iron roof must be boa
to keep the building warm. Skylights
easily be introduced into this kind of
without much expense, as well as prov
made for ventilation along the ridge as sh
on the diagram (Fig. 2). At the same
iron does not make nearly such a good ro
slates, which, if well chosen and carefully
are practically indestructible. As it is
expensive to introduce skylights into a
roof than into an iron one, it is best to
them out and to provide instead one or
wells with glass roofs. The wells also ac
very efficient ventilators, the sides b
composed of louvres, the position of w
can be adjusted to suit the weather. A gl
at the diagram (Fig. 3) will explain this p
Fig. 4 shows a detail of this ventilator.
louvres are pivoted on the axis of their u
edges and can be opened or shut as the
jecting spurs on the centre pillar are tur
Whether the roof is covered with iron or slat
tiles, it should never be left without an e
gutter. Its omission, by allowing the rain
the roof to run down the walls, keeps
damp, just as much as the lack of a dampco
does. Further protection can be given
projecting the eaves beyond the walls.

Light and ventilation are the great deside
in a cow-house. For many reasons it is
ferable in a cow-house with double stal
have a central feeding passage. One re
is this, that with fairly low eaves it is pos
to obtain plenty of light and air through
low walls. This could not be done if the
were placed facing the outside walls, u
in the exceptional case when two fee
passages are introduced between the h
of the cows and outside walls. There i
saving of labour if one dunging passage
gutters from both sides, over one fee
passage and two dunging passages. The sa
in reality is with the latter system in a prop
considered plan.

Nothing contributes to cleanliness in
cow-house so much as light, and the mini
of 2 sq. ft. per cow can with advantag
increased. There should be no difficult
doing this, for windows can be ranged
both sides and at one end. The con
form of cow-house window has not muc
commend it. I refer to the type only

preferable to glaze the entire area, pivotin

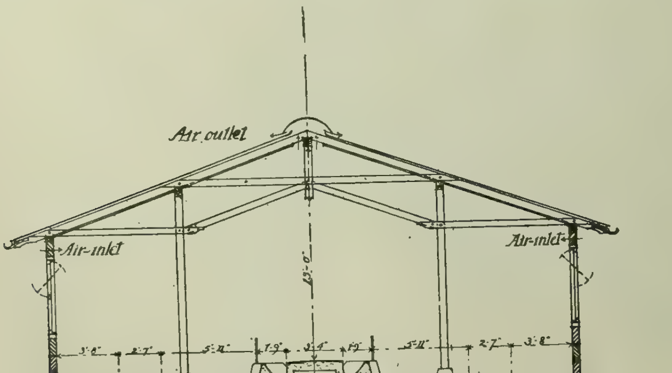

Fig. 2.

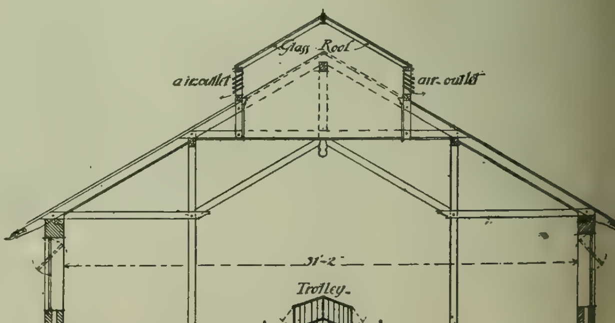

Fig. 3.

ɔer half horizontally. A simple fastener ɔws it to be opened very easily by the cow-n. These windows may be made of wood iron. A small opening should always be under the sill to allow condensed moisture to ape. In addition to the windows small square nings should be left in the brickwork, close ler the eaves, and fitted with a simple ɔden sliding shutter on the inside to regulate inflow of fresh air. I have already spoken lighting and ventilation in the roof, and is unnecessary to mention them again ept to say that the outlets for foul air in roof should not be less than twice the area the inlets. It is well to err on the side of erosity. The minimum given in the nphlet on the construction of cow-houses ntioned above is 40 sq. in. per cow for the ets.

'he whole point about housing milch-cows half the year is to prevent the unnecessary sumption of food merely to keep up the perature of the cows—that is to say, for poses other than that of producing milk. may therefore prove false economy to keep cow-house too freely ventilated if it be the expense of warmth. But there is ays a golden mean, and in a properly-con-ucted building with boarded roof and low walls it should be possible to prevent temperature falling below 50 deg. Fahr., ile admitting a plentiful supply of fresh air. ne experiments undertaken by the Highland Agricultural Society during the winter of 3–9 showed that a cow-house kept at deg. Fahr. contains three times as much bon dioxide as a freely-ventilated building t under 50 deg. Fahr. Further, and what of equal importance, the production of milk y be as great in the one case as the other, ile the health of the animals will be better the latter case.*

t is essential that the floors of a cow-house uld be damp-proof—that is to say, they uld be so constructed that the damp from ground cannot rise through them. Made s they will also be impervious to all liquids ught into contact with their surface, which drain off into channels constructed for the pose. Cement concrete makes the best cheapest floor, and it is easily susceptible being moulded into the shapes required standing-space, mangers, gutters, etc.

t may be said in passing that the floor, as ided on the base which the diagrams illustrate gs. 2, 3, and 5), do not pretend to be able accommodate all kinds and conditions of tle. It will be found, however, to provide ple room for Shorthorns. The principle lerlying the design of the floor remains the ne for all classes of cows. The space allowed each cow in this case is 3 ft. 1 in. by 5 ft. in. long, exclusive of the manger.

n this floor two features distinguish it from usual type—(*a*) the width of the dunging ter, (*b*) the manger (Fig. 5). The former 2 ft. 7 in. wide with a fall of 1¾ in. to its er side, whilst the latter is continuous, ring for fodder and water, and the feeding sage is raised to the level of its top. The ra width of the dunging gutter and its sharp outwards are both dictated by the necessity getting the liquid part of the dung to a tank the shortest space of time. The fæces will into the gutter at the cow's heel and remain there, but the urine wherever it falls will be led away to the drain as quickly as possible. With a gutter of this width and shape all liquids will quickly find their way to its outer corner and so to the drain, for it would be made to slope longitudinally (1-40) as well as towards the back. A very little slope is given to the cows' standing-place and one slightly greater is given to the dunging passage, so that no liquid would be likely to lie where it was not desired. It would thus tend to dryness and would quickly dry after being swilled down with water.

Before leaving the subject of floors it will be as well to consider the material of which they should be made. For the concrete it is preferable to use granite, gravel, or hard limestone, or broken bricks, and no piece should be larger than a hen's egg. Granite, of course, makes the best floor, but, while it is essential in a horse-stable, it is not so necessary for a cow-house, so that it is unnecessary to go to this expense if a cheaper material can be obtained. The concrete may consist of one part of cement, three parts of sand, with as much as five parts of broken stones, and should be laid on ground that has been well rammed about 5 in. thick and formed roughly to the contours required. When this is hard, a finishing coat of cement and sand should be laid and finished with a smooth surface. It is unnecessary to form V-grooves in the floor of the stalls, or indeed in any part of a cow-house, as they are difficult to keep clean, and one of the chief ideas governing the design of these floors is to make them so that they can be cleaned easily with a hose. It will be found that a cement floor is not slippery when it is kept clean.

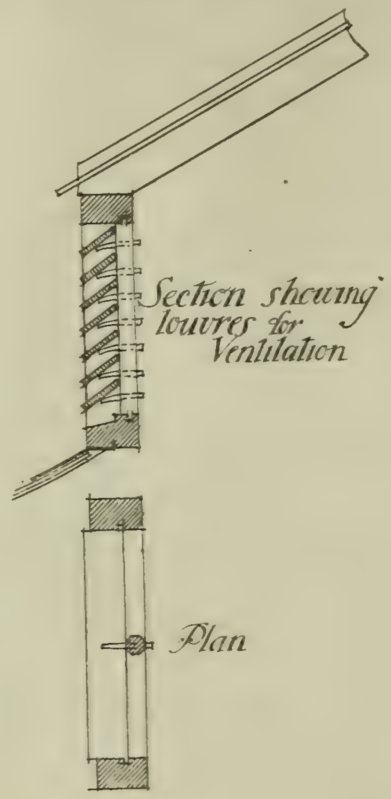

Fig. 4.

A counsel of perfection requires that each cow should have a separate manger in order that she can be fed according to her powers of producing milk—each cow having practically a different menu—and also that she should have a water-trough so that she may drink when she pleases. But, however desirable these niceties may appear as ideals, they are costly in the first instance. Besides, a scientific and careful dairyman will grade up his cows till they are fairly similar in output, and so entitled to the same amount of fodder, and even with a continuous manger it is an easy matter to give a favourite cow a little extra cake.

Water is introduced into the cow-house in order to avoid sending the inhabitants out in the depth of winter to drink in a cold pond. In this way it protects the cows from the risks of chills, and incidentally it increases the milk yield.

It is unnecessary that the cow should be able to satisfy her caprice of drinking when she will; therefore a separate water-trough is really not necessary. The manger makes an excellent one. Water should be laid on to it at one end and an outlet should be provided at the other. With this method the labour involved in watering cattle is eliminated, and it is no trouble to clean the manger. It is well to be able to flood the manger quickly, so that the last cow can drink at the same time as the first. A 2-in. supply should therefore be used, with a tap of the same size actuated by a lever. The manger should be given a fall of about 1 in 200, or even less, to prevent the water running off too quickly. Several considerations dictate the shape of the manger, which, it will be observed, is different from those in general use. It will be obvious that a given amount of water will rise much higher in it than in one of semicircular section. As the water is running away all the time a considerable saving of water is effected. Again, the cow has greater control of her food using such a manger, being able to push it with her nose into the corner, where it has no escape but down her throat. The feeding passage should be kept level with the top of the manger, so that the latter can be filled by gravity if a properly-designed trolley is used. On the diagram (Fig. 3) I have shown a trolley such as has been evolved for the Manor Farm, Wantage. It will be seen from the section that the sides are hinged at the top so that they can be opened by releasing a fastener, when the roots fall out into the mangers on either sides. A division down the middle and a bottom which slopes up to this division will cause the trolley to empty itself with a minimum of labour. A railway the metals of which stand above the level of the feeding passage is objectionable in many ways; it is difficult to keep clean, and the rails form harbours for dirt; it is also a stumbling-block for unwary steps.

By raising the passage as I have suggested above it is possible to form a railway free of objections. It consists of an ┐ iron (Fig. 5, *C*) on each side of the passage, and level with it. It thus acts as a rail and as a strong binder to the concrete. It will be observed that the wheels of the trolleys have their flanges on the outside instead of inside.

The apparatus for tying up the cows should be as simple as possible (Figs. 5 and 6). For

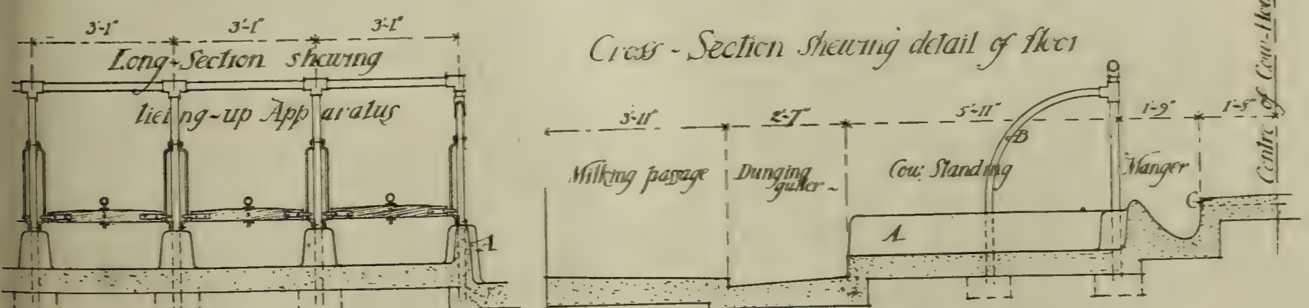

Fig. 5.

"Journal of the Board of Agriculture," October, , pp. 550, 552.

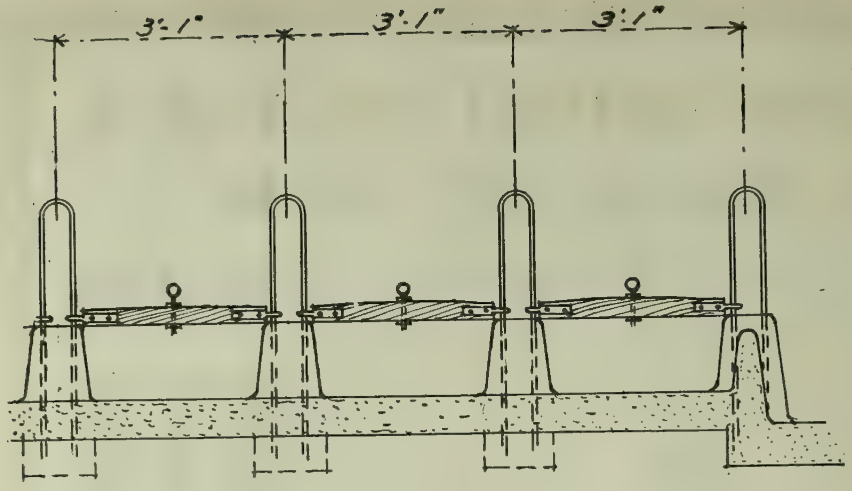

Fig. 6.

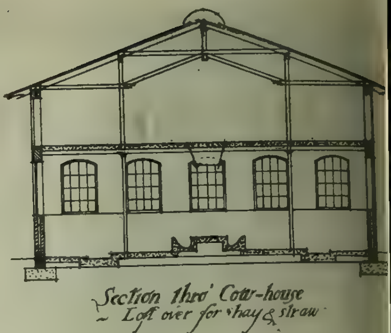

Fig. 8.

cleanliness and health iron is a better material than wood, and recently several ingenious arrangements of tubular iron have been put on the market for this purpose. In the illustrations (Figs. 5 and 6) I have shown two arrangements which are both cheaper than any of those on the market (the simpler, Fig. 6, indeed costing no more than 10s. per cow). As a rule cows rise when feeding begins, and in their eagerness are liable to push towards the passage. At this time, if they void any excrement it falls on the floor of the stall and is likely to soil the cow later if it is not at once cleared away. A tying-up apparatus therefore should be contrived, if possible, to prevent this forward movement, while giving the animal freedom to move its head up and down and to a limited extent sideways. Both of these fittings fulfil these requirements. In principle they are the same. Each has a tethering-bar of ash-wood with a swivel-ring in the middle, to which the cow is tied by a rope. The tethering-bar can be raised by a movement of the cow's head some 18 in. above the top of the manger (a height sufficient to bring the neck of the animal in a straight line with its back), but that is its only movement—up and down. The diagrams explain themselves better than words, so that it is unnecessary to say much more on this head beyond observing that it is very necessary to build the iron bars well into the concrete. At each end of the cows' standing-place it is advisable to form a low wall (as high as the manger) (Fig. 5, *A*) to prevent the litter falling on to the floor of the cross passage, and to keep the end cow in her place an iron bar, in the form of a bow, is inserted in the concrete (Fig. 5, *B*).

In attempting the metamorphosis of an old barn or cow-house into a scientific building, it may be necessary to adopt some different arrangement of the cows, but if the width is sufficient the method advocated here will be found economical in working. As a rule one of the first operations will be the insertion of a damp-proof course (most old buildings do not possess one). An opening is made in the wall about 6 in. above the ground, a few inches high by some 2 ft. or 3 ft. long, into which are laid two courses of slate laid in cement, in such a manner that the upper slate covers the points of the lower. The cavity is then filled in and another slit is cut in which slates are bedded as before and so on. An eaves gutter will most likely be wanted in an old building, and more windows will require to be knocked through the walls. But the whole idea should be to endeavour as far as possible to make the altered building possess the amenities I have recommended for a new one.

A cow-house in itself is only a comparatively small part of a dairy farm, and I have endeavoured to show (Fig. 7) the relationship of some of its parts, as the dung-pit, urine tank, calf-house, etc. The diagram shows these. Over the milk-room a tank should be placed with a sufficient capacity for a day's consumption—ten gallons per cow in addition to the water required for the milk cooler. It is preferable to fill this tank by gravity, but if that is impossible, then recourse must be had to pumping. In this larger plan I have arranged a loft over the cow-house for the storage of hay and straw, which can easily be served for food and litter to the cows through two traps in the roof floor (Fig. 8). Over the roots and food mixing room are stores for oil-cakes and other foods, which can be dropped into the trolley below with a minimum of labour.

As an annex to the main building another house is shown for calves and pigs. It will be noticed that the whole disposition of the buildings is arranged with an eye to the manufacture of manure, both liquid and solid. The former by gravity finds its way to the tank and the latter by a comparatively short route can be carried from all animals to the dung-pit.

Many of the principles advocated above have been adopted at the Manor Farm, Wantage, which I have just completed for J. Madson-Mygdal, R.O. The cow-house is planned to accommodate 160 cows, standing in four rows (Fig. 9), with feeding passages between heads of the animals. The low building the right of the view (Fig. 10) gives a g idea of the appearance of the cow-house fr the outside. The other buildings are ba calf-house, granary, and other adjuncts o modern farm.

◆

ECONOMIES DURING THE WAR.

The Lord Mayor of London presided at opening of a Conference of local authorities others called by the Royal Sanitary Institu at Buckingham Palace-road, on Friday week, to consider the question of "Sanit Administration under War Conditions," said that, whilst many suggestions regard economy were now being made, they had discriminate between what was only sentim and mere convenience and what mi constitute a danger to health.

The Mayor of Westminster, who succee the Lord Mayor in the chair, said that no m important question could be discussed at present time in its relation to public hea Every authority in the country was experienc the difficulty of maintaining that high stand of sanitation which had been the pride of

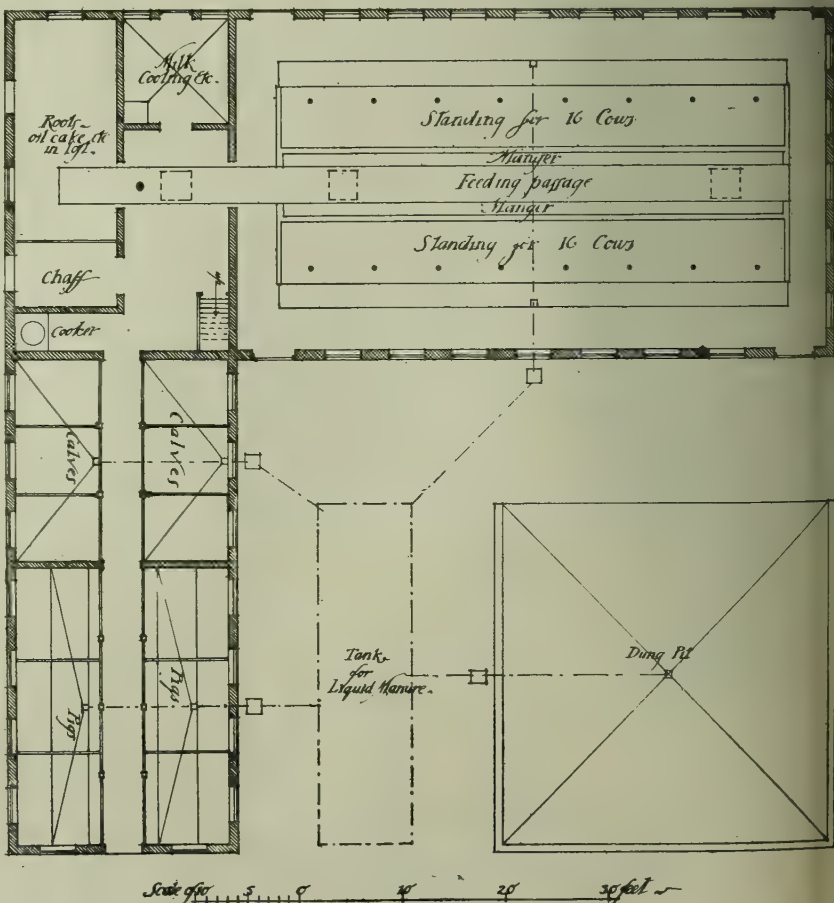

Fig. 7.

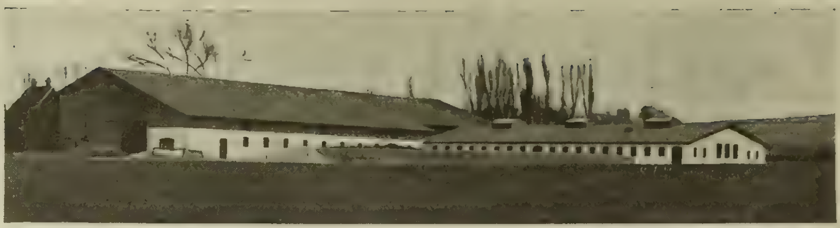

Fig. 10. Design and Construction of Cow-Houses. (*See page* 440.)

y. In Westminster they had just had
sider the matter of street paving. Many
ir streets were paved with wood, and,
t material could only be obtained at a
ost, they had had to curtail their renewals
content themselves with repairs which
s afraid in the long run would not be
nical. They had endeavoured to make
old wood blocks as far as possible, and
ow employing women for cleaning them.
revious day they discussed the paving for
ane, and, owing to the cost of wood, had
d to make a trial with a new paving,
Lithomac." It was only an experiment,
would be interesting to see how that
al resisted the heavy traffic to which the
as subjected.

H. P. Boulnois, M.Inst.C.E., read a
in which he surveyed the whole field of
ipal activity and pointed out where
nies might be effected. As regarded
and streets, he said that all road engineers
agreed that any large curtailment of
diture in this direction would inevitably
a much heavier expenditure in the near
. They might to some extent economise
ferring the resurfacing of a road and
g the existing surface in repair. Tar-
ng should be proceeded with on all
the surfaces of which were in fair repair.
wood-block pavement had worn to an
that renewal seemed imperative, it was
imes an economy to reverse the blocks
et a further life of four or five years out
em. Women had been employed with
erable success in some towns as street
ers, the only fault being that they were
rticular in cleansing the street like they
their own back yard. Street watering
be reduced to some extent, but it was
difficult to define the boundary between
and necessity with regard to this service.
uld be false economy to attempt to
ish the scavenging service, but a great
could be effected if householders would
more of the refuse. If a simple domestic
tor could be designed to be attached to
a gas or coal kitchen range it would
assist in a much needed reform. Any
nies in the direction of sewerage and
disposal should receive very careful
eration, or the standard of sanitation
be seriously lowered. Whether the
of stopping contracts which had been entered into on favourable terms would result in an eventual economy was very doubtful if the works had to be finished hereafter, as the trend of all prices was in an upward direction and they were not likely to come down after the war. The only economies which the water engineer could practise was a closer supervision of the pumping station, filter-beds, etc.; but the public could materially assist if they would prevent the excessive waste of water that occurred in all homes and establishments. The work of clearing slum areas must, he feared, be suspended during the war, not only from the difficulty of procuring housing accommodation for the people turned out of their homes, but also the great expense incurred in these operations. Greater vigilance must be exercised temporarily by the health officers in such districts, and very glaring isolated cases dealt with. With regard to "Housing," this would loom large after the war, even if it had not already done so. They heard on all sides of the present dearth of houses for the working classes, aggravated by the establishment of munition works, etc.; but what was to be done? The great rise in the value of labour, materials, and haulage was likely to continue, and every day it would become more difficult to build cheap houses at suitable rents. This, to his mind, was the one great line in which the war would seriously affect the question of the maintenance of the standard of sanitation, and, unless some scheme could be introduced whereby the employers of labour would be held responsible for the provision of suitable houses for their employees, he did not see how the problem was to be solved. The subject was deeply interesting, but would require a paper to itself to properly discuss. A large number of branch libraries and reading-rooms might be closed altogether, and perhaps even all such places, as well as museums. An example in this direction had been given in London by the closing or partial closing of a number of museums. In any case the purchase of books, specimens, and exhibits could be postponed. In some cases the general markets might be closed, or at all events less expensively managed and maintained. Economies in heating, lighting, etc., could be practised in all public buildings, and evening meetings of all kinds should be discouraged. The author also advocated the cutting down of unremunerative tramway services, the utilisation of conservatories, etc., in parks, and forcing houses for vegetables, and various general economies in regard to printing, etc.

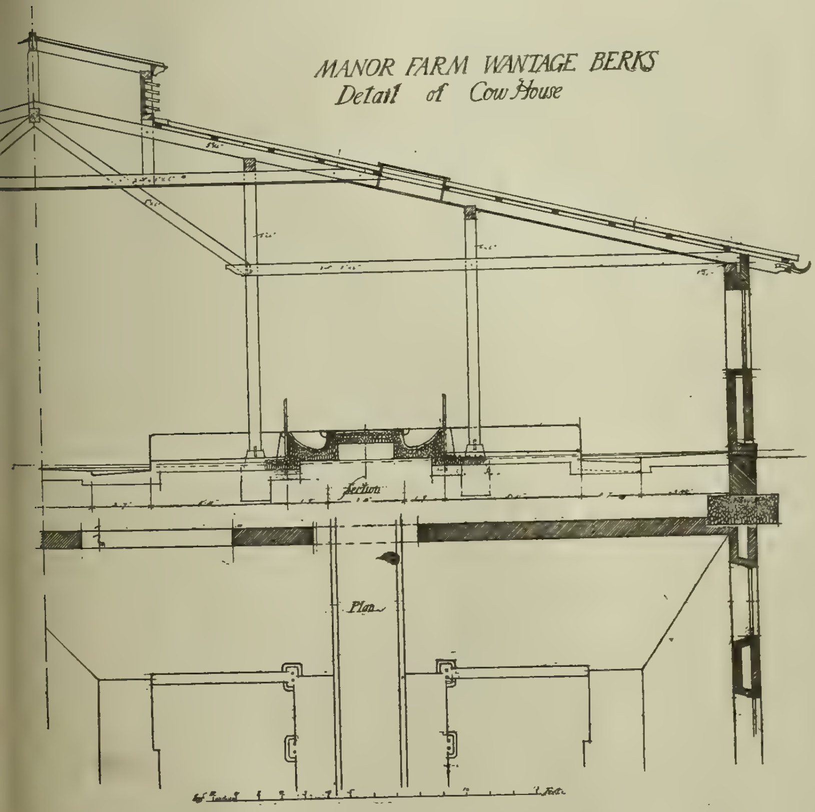

Fig. 9. Design and Construction of Cow-Houses. (*See page* 440.)

Dr. James Wheatley (Medical Officer of Health for Shropshire) followed with a paper which dealt with the question of economy from the medical point of view, and urged the desirability of not neglecting scavenging if the health of the children was to be preserved.

Considerable discussion took place, which followed largely on the line of the danger to health if excessive economy in sanitation was practised.

Dr. Carr (Newcastle-on-Tyne) suggested that local authorities ought to have more control over the plans of houses erected for munition workers. They had had a large number erected in their district, and, thanks to the courtesy of the contractors, they had been able to influence them in several matters, but in regard to drains they were "up against them"! The result was that, whilst in a large area the drainage now was fairly efficient, it would not be efficient after the war or for any extension of the present area.

Major A. J. Martin thought that as men were conscripted for the trenches those left at home ought to be called upon to do the work of scavenging the roads and other like work.

Mr. Chapman (Holborn) expressed the hope that local authorities would set aside money in these times for the work which would be required later. Holborn had set aside £5,000 for roads.

Alderman Todd (Gateshead), Dr. Nash (Norfolk), Dr. Miller (Hereford), Dr. Boobbyer (Nottingham), the Rev. F. Darmody (Wolverhampton), Mr. Cotterill (London), and Dr. Jones (Hereford) also took part in the discussion, and it was decided to ask the Council of the Institute to consider what temporary extension of local powers were necessary in order to economise labour in the public health service and to make it more efficient.

The meeting concluded after votes of thanks to the readers of papers had been heartily agreed to.

◆

WORKMEN'S HALL, SHEFFIELD.

A new workmen's hall has recently been opened at the Tinsley colony in Bawtry-road, Sheffield. An area of 31 acres has been laid in streets and covered with forty-seven blocks of single-storied wooden buildings containing 199 houses for families; fifty-three hostels, each to accommodate thirteen workers and a caretaker; fourteen other hostels, each for twenty-eight workers; and three colony groups, each for 120 workers, who will get their meals in special restaurants. The hall, which will seat about 360 persons, is to be used for recreative and social purposes, and for religious services. The City Architect, Mr. F. E. Edwards, has undertaken the work of arranging for the colonies.

THE BUILDING TRADE.

THE CUTTING OF GALVANISED-IRON.

We have received the following interesting letter from Sir John Cockburn:—

"Sir,—I recently had occasion to take to pieces for the purpose of re-erection elsewhere a large galvanised-iron shed, and, as an unexpected difficulty was encountered, perhaps some account of the manner in which it was overcome may be of service to those who find it necessary to undertake work of a similar nature. The wooden framework of the structure was slight, the necessary strength being obtained by innumerable mushroom-headed $\frac{5}{16}$-in. screw bolts, by which the sides of the corrugated sheets and their ends in the curved roof were riveted together. The nuts of these were found to be rusted so fast on the threads that, with few exceptions, all attempts to unscrew them, even after copious paraffin and oiling, were futile. An attempt was made to separate the sheets by cutting through the bolts or splitting the nuts with cold chisels, but progress was so slow and the damage to the iron so great that this had to be abandoned. No better success attended the use of hack saws. Bolt croppers were tried, but it was found impossible to insert the jaws of these either outside or inside. Many machinists were consulted without avail. At last I came to the conclusion that what was required was a bolt cropper with pincer jaws not more than $\frac{3}{8}$-in. wide and capable of opening wide enough to pass over the nuts on the inside, so as to seize and divide the bolt within the hollow of the corrugated-iron. There was, however, no such tool to be obtained in London. Eventually Messrs. Buck & Hickman, 2, Whitechapel-road, made one for me by converting a pair of the shear jaws of Porter's No. 2 "New Easy" Bolt Clipper into pincer jaws. With this the nuts were snipped off almost as easily as one gathers blackberries, and the job was finished in a very short time without the slightest damage to the iron. John A. Cockburn."

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The Plans Committee of the T.C. has approved of the following new buildings in Aberdeen:—Alterations and additions in connection with premises on the north side of Spring Garden, for Messrs. W. M'Kinnon & Co., Ltd., engineers, per Mr. George Coutts, architect; offices, York-place, for Messrs. Hall, Russell, & Co., Ltd., per Mr A. H. L. Mackinnon, architect; petrol store in connection with Phœnix Works, Russell-road, for Messrs. W. Riddell & Co., oil merchants; shelter in connection with Grammar School recreation ground, Harlaw-road, for the Aberdeen School Board, per Messrs. Walker & Duncan, architects; stable, Wellington-street, for Mr. Alexander Walker, carting contractor, per Mr. John Rust, architect; alterations in connection with the premises, Nos. 77 and 79, Crown-street, for Messrs. Mackenzie & Wilson, advocates, per Mr. W. J. Devlin; temporary building in connection with St. Fittick's Church, Walker-road, per Mr. James Clark, session clerk; temporary building (boiler house) in connection with King's College, for the University Court, per Mr. D. R. Thom, Secretary to the University; plan of coal sheds, Regent-road, for Messrs. Ellis & M'Hardy, coal merchants, per Messrs. Kelly & Nicol, architects.

Beaconsfield.—The U.D.C has passed the following plans:—Building plan, house, Curzon-avenue, Mr. E. H. Goodyear; drainage plans, The Firs, Burke's-road, Mr. T. G. Cowan; the Gas House, Station-road, Uxbridge Gas Company; Mordeen, Reynolds'-road, Mrs. Garth.

Burnley.—The Burnley Borough Surveyor has been instructed to draw plans and estimates of a building for a central reference and reading library.

Cambuskenneth.—The Patrons of Cowane's Hospital have adjusted the articles of roup of ground at Cambuskenneth. The ground has been feued to Mr. John Fraser, architect, Dunfermline, on behalf of a company for the erection of houses of the class suitable for miners.

Canada.—The Imperial Trade Correspondent at Toronto reports that a company which has been operating two stores in that city for many years is increasing its capital to 7,500,000 dollars for the purpose of erecting new premises and acquiring a departmental store at Montreal as a subsidiary enterprise.

Derby.—The Improvement and Construction Committee of the T.C. has approved ten building plans.

Dundee.—Plans passed by the T.C.:—Byron-street, boiler-house for Messrs. Francis Stevenson & Sons; West-street, alterations on warehouse for Messrs. Francis Stevenson & Sons; Yeaman Shore, shed for Messrs. Nicoll & Son.

Girvan.—Girvan T.C. recently considered a petition from the proprietor of Bargany Estate for warrant to lay-out two new streets between Montgomerie-street and the railway. It was stated that miners' houses are to be built on the new streets, and that it was necessary that the erection of these houses should be proceeded with at once. The Council continued the petition for a week in order to suggest several modifications of the plans.

Glamorgan.—At a recent meeting of the Glamorgan Roads and Bridges Committee it was stated that the Roads Board was prepared to make a grant of £6,000 towards the cost of tar-spraying and tar-macadamising the roads in the county during the year. It was stated that the proposed road improvement near the Cow and Snuffers Hotel, Llandaff North, was to be proceeded with forthwith. The Surveyor added that it was proposed to spend altogether about £13,500 on road repairs during the year.

Glasgow.—Glasgow Dean of Guild Court has granted the following linings:—The Cassel Cyanide Company, Ltd., 19, St. Vincent-place, to erect an extension to their works in Shuna-street; Messrs. Millers, Ltd., tanners, 847, Duke-street, to erect a new boiler shed; Messrs. Frederick Braby & Co., Ltd., Petershill-road, to extend their sheet mill; Messrs. Barr & Stroud, Ltd., engineers, to erect workshop sheds at Caxton-street, Anniesland; Messrs. Andrew Brown & Son, rope manufacturers, 52, Bellfield-street, to erect workshop, office, and store; Messrs. George Christie, Ltd., 197, Broomloan-road, Govan, to add to their works; Messrs. David Carlaw & Sons, engineers, 11, Finnieston-street, to construct an additional story in Houldsworth-street.

Grimsby.—The R.D.C. has passed a plan for a new temporary mortuary near the Police Station at Immingham.

Kensington.—The Licensing Justices have passed plans of alterations intended to be carried out in the Portobello Tavern, 138, Portobello-road, Kensington.

Kinghorn.—A glass-blowing establishment at Kinghorn are extending their premises at a cost of £13,000.

London.—The Licensing Justices have passed plans of alterations to the Rose and Crown, Union-street, St. George, Mr. D. Aylott, licensee, and the Angel, Upper Ground-street, Christchurch, licensee, Mr. J. Donaghy.

Marsden.—The Health, Sanitary, and New Buildings Committee has approved the plan of a workshop in Peel-street for Mr. James Schofield.

Middlesbrough.—At the recent conference of local ironmasters, employers of labour, and education authorities of Durham and the North Riding, held at Middlesbrough, a scheme was launched for the establishment of a technical college at Middlesbrough.

Newcastle.—Plans for the erection of a new electric power station have been approved by the U.D.C.

Ramsgate.—The T.C has approved plans for the erection of a female staff and officers' room, Ramsgate Brewery, owners, Messrs. Tomson & Wotton, Ltd.; and for alteration at 15, Albion-place, owner, Mr. Dicker.

Ravensthorpe.—The Yorkshire Electric Power Company contemplates making extensions to its central station at Ravensthorpe at an expenditure of £100,000.

Redhill.—The Reigate T.C. has approved plans from Messrs. Love & Malcolmson, Ltd., for the reconstruction of the Athenæum Printing Works, Redhill.

Southwick.—At a recent meeting of the Southwick-on-Wear U.C. a plan was approved for the erection of an electric power sub-station a Southwick yard of Messrs. Swan, Hunte Wigham Richardson. The firm are exten their premises and making provision for ex ing more work.

Tunbridge Wells.—The Burial Board mittee of the T.C. has decided to tar pain paths at the cemetery, at a cost of £165.

Wantage.—At a recent meeting of the R. tenders were received for laying a drain at combe Regis for dealing with the flooding t and referred to a committee to deal with report. It was also resolved that an applic be made to the L.G.B. for sanction to borro sum of £2,550 to carry out a scheme of drai for the parish of Letcombe Regis. The Surv has been instructed by the U.D.C. to tar Church-street in addition to the streets us treated.

WAGES IN THE BUILDIN TRADE.

Dublin.—The following are particular advances in wages or war bonuses give the various trades from October 18, 191 June 9, 1916, with the various dates came into operation:—Labourers: War b at the rate of 6d. per day for each day wo provided no time is lost by default of work Came into operation October, 1915. tricians: Increase from $9\frac{1}{4}$d. to $9\frac{3}{4}$d. per h when working the winter hours, $10\frac{3}{4}$d. engaged on War Office work or work dir controlled by the War Office to be pai addition to this a war bonus of 3s. per wee 6d. per day or any part thereof. Came operation November 22, 1915. Brassfoun Finishers, and Gasfitters: Increase from per week to 38s. per week from April 1, Carpenters: Increase from 9d. to $9\frac{3}{4}$d. May 12, 1916, and a further $\frac{1}{4}$d. on June 27, bringing the rate up to 10d. Brickla Increase of $\frac{1}{2}$d. per hour, making the wages per hour, and in addition a further $\frac{1}{2}$d. hour war bonus. The wages therefore be $10\frac{1}{2}$d. per hour until the next pay day peace is signed, after which the rate wi 10d. per hour. The wages and war bonus into operation on May 19, 1916. Overtim be computed at the 10d. rate. Painters: bonus to be at the rate of 4d. per day for day worked, provided no time is lost by de of workman. Apprentices to be 2d. per under same conditions. Bonus to be pai week ending June 3, 1916. Plaste Increase from 9d. per hour to $9\frac{3}{4}$d. (fifty- week) and a war bonus of $\frac{1}{4}$d. per hour d the continuance of the present war, bri the wages to 10d. until next pay day peace is signed. Overtime to be comp at the $9\frac{3}{4}$d. rate. The increase to come operation as from May 22, 1916.

Portsmouth.—At the recent qua meeting of the South-Eastern Centre Boa Conciliation for the Building Trades an a was heard from the following trades in district:—Carpenters and joiners, brickla masons, plasterers, painters, plumbers, na and labourers, for advance of wages alterations of rules. The appellants' case stated by Messrs. Healy and Lacey (carpe and joiners), Penn (bricklayers), and Pe and Glasgow (painters). The demand wa an advance of wages of $1\frac{1}{2}$d. per hour i case of carpenters and joiners, brickla plasterers, and masons, and of 2d. per in the case of plumbers, painters, na and labourers, and was based upon increased cost of living and excep conditions prevailing. The demand inc a new rule for an extra rate for men ployed on silicate-cotton work, an additi the rule as to shaft and steeple work to extend it to buildings and works of struction, and a further addition for fire and work in confined spaces, an alterati the overtime rate on Saturdays, and a rule to provide for night-gang work. appellants made a strong point of the adv already conceded in other towns during twelve months or so, and urged that the conditions had in effect taken away from n the purchasing power which their wages ı-rly gave them, and they asked that it be ially restored to them by the advance of es, etc., demanded. For the employers srs. Priyett, Salter, Coghlan, and Roskell eared, and in their reply traversed the uments of the appellants. They agreed erally as to the increased cost of living, and neet the views of the operatives they now gested that the summer working hours ıld be increased and the increase paid at time and a quarter. After answering stions the parties retired, and the Board sidered and decided the case as follows:—

---

* See also our list of Competitions, Contracts, etc., on page 446.

hat this Board, having heard the case from employees and employers of Portsmouth, eby decides that the case will be met by the ment of 2s. 6d. per week as war bonus, as n May 1, 1916, which bonus shall cease e months after peace is declared, no bonus be paid until a full week has been made ept where time is lost by stress of weather."

Board then considered and settled remainder of the operatives' demands ollows:—Rule 2: Rates of wages as before s war bonus as per resolution given above. posed new rule *re* silicate-cotton work ck out. Rule 3: Rule to remain as before h the addition, "That all men engaged on ert work receive ½d. per hour extra, and men on hot work 2d. per hour extra, such es to be cooled down below 120 deg. before ng repaired." Rule 5: Rule to remain as ore, but with the overtime rate on Saturdays ied so that the rate from 12 noon to 8 p.m. ll be paid for at time and a half, after 8 p.m. ble time. Also the addition of the following o night gangs:—"Men engaged on a night g to be paid 1d. per hour in addition to the inary rate of wages, but the hours worked hout overtime rates not to exceed fifty week, being ten hours each night for five hts during summer, and not to exceed y-five per week, being nine hours each night five nights during winter. Meal-time rs during the night to be one and a half. m Saturday midnight to Sunday midnight, ble time. Any time worked by a night gang ween leaving off time on Saturday morning starting time Monday night shall be paid according to the following rates:—The t four hours worked on Saturday, time and half, afterwards double time till starting e on Monday night, at night gang rates."

TRADE NEWS.

he Sherburn Picture Hall, Hull, is being plied with Shorland's special inlet ventilators Messrs. E. H. Shorland & Brother, Ltd., of lsworth, Manchester.

oyle's latest patent "air-pump" ventilators latest improved air-inlet brackets have n adopted for the offices of Messrs. Engert & lfe, Ltd., at Barchester-street, Poplar, E.

Ve have received a copy of a new price list Clincher Band Solid Rubber Tyres, just ued by the North British Rubber Comny, Ltd., Castle Mills, Edinburgh. These es are supplied for use in the United Kingn, and are guaranteed for 10,000 miles' vice. The price list shows patterns of the es.

'Coatostone" has been ordered by His ghness Maharajah Alwar for internal and ernal treatment of Seriska Palace, India, and same has been exported by the Stone eservation Company, Ltd., of 9a, Little mes-street, Gray's Inn, W.C., who have rchased the Coatostone Decoration Company, d are now the sole proprietors and manuturers of "Coatostone."

Vith reference to the particulars of an proved window fitting which appeared in r last issue, it should have been stated that patent referred to has passed beyond the visional stage, the complete specification ving been accepted and the patent sealed. e present address of the patentee (Mr. J. anford) is "Ledbury," 3, Hardwicke-road, igate, Surrey.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

—	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers' Labourers.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi.; Public Appointments, xxii.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

⁎ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3829. JUNE 23, 1916.

CHARING CROSS BRIDGE.

WE have expressed our decided views as to the proposals which have been brought into the region of practical politics by the endeavour of the South-Eastern Railway Company to obtain Parliamentary powers for strengthening e present railway bridge over the river. There can be no vo opinions as to the unsightliness of the hideous example of ngineering utilitarianism which now spans the river; but, hile recognised as an eyesore and a disgrace to the greatest ty in the world, it is clear that we have to pay for the mistakes past generations, and we were prepared to wait until time ndered the demolition of the bridge inevitable. But when e South-Eastern Railway Company, knowing that their ridge was of an inadequate strength to bear the weight of creased traffic, brought forward a scheme involving the xpenditure of a great amount of capital in strengthening ne side of the bridge alone, the question became one of urgent nd immediate importance.

We have agreed on a party truce in politics to meet urgent ational and patriotic wants; we have made sacrifices of habits nd convictions such as no previous generation has made, ecause we all know that history is being re-made and the xistence of all we have cherished hangs in the balance. There at present no party within the confines of these islands, and r the first time in the memory of any of us every class nd section of the people have one common object to which all se is subordinated.

It is extraordinary that in such a crisis a private company ould seek to obtain powers for a measure which is highly ontroversial, especially as it is recognised that the work if arried out cannot be put in hand until the termination of the resent colossal struggle. Considering the serious preoccupaon of Parliament and the local authorities concerned, the tion of the railway company would seem to be that of a ody which seeks to obtain an advantage which it is doubtful gaining when national politics no longer entirely occupy the ttention of the public.

Some critics may wonder that we have not referred to the uestion at greater length in previous issues, but our position a clear and logical one. When, through the energetic and apable action of the Royal Institute, the London Society, and ther bodies, it was agreed that the opponents of the ill should be heard by the House of Lords Committee, e considered the question for the time *sub judice*, and hought that the comments of the Press were more likely prejudice than to help matters. A Committee of he House of Lords is a judicial body, and in that apacity has to confine its attention to the evidence placed efore it and to deal with no extraneous matter. The fact hat a question has become one of popular Press commentary efore it comes up for the consideration of a judicial committee ould appear to us to be likely to do harm rather than good to he adherents of any cause. But, now that the preamble of the ill is approved, the reticence which we have employed is no onger necessary, and we can freely state our views on the hole question. We do not think that the fact that the Bill is o be brought before the House of Commons is a sign that its romoters are likely to obtain the approval of Parliament to heir proposals, but take it to be an admission on the art of the Committee that the questions involved are so sharput and definite that the nation's representatives can be xpected to form an accurate judgment as to the merits of he proposal; while there is no doubt in the minds of any a suspicion that any alternative scheme is likely to be somewhat unpractical because it is so evidently æsthetically desirable! It is difficult to rid ourselves at once of one of the fetishes of the nineteenth century, which was that necessity involved the destruction of beauty—a fetish which is responsible for the hideous deformation of town and country and the absolute want of all proper foresight. We are at the beginning of a new era, and find that much of the work we must do involves the undoing of past mistakes and the adoption of entirely new methods if we are not to weight down successive generations in our turn.

Cheapness was the recommendation of the original bridge, and like most cheap things it is likely to prove expensive to its owners. Now it is proposed to strengthen it at a cost of £170,000, and it would appear in doing so to make it, if possible, an even greater eyesore than it is at present. The Committee, of which Lord Bristol was the chairman, was instructed to take into consideration *the requirements of traffic over the river at this point*, and to hear evidence from the various bodies interested. Now, Westminster and Waterloo Bridges are 960 yds. apart, a greater distance, as Professor Pite points out, than that separating any other public bridges in Central London, and if the railway bridge is to remain there is no practicable position for road access from bank to bank between those points—a factor which has an important bearing on the subject, seeing the enormous growth of road traffic which has taken place within recent years. Again, all those who are interested in the welfare of London recognise that the district which is most urgently in need of improvement is the southern side of the river, and a necessary part of such improvement is the provision of means of açcess; moreover, there is hardly a point in the whole course of the river through Central London where such communication would be more useful, for Trafalgar-square is to the west of London what the Bank is to the City—a great meeting-place of important thoroughfares. The scheme by Mr. Barclay Niven and Mr. Raffles Davison, shown by sketches in this year's Academy, illustrates this, and, though the plan is only suggestive, we can realise the enormous importance for traffic purposes of a road bridge at this point communicating directly with Trafalgar-square and leading up to a new station on the southern side of the river. The company's station at Charing Cross is already cramped, and the space available there only amounts to four acres, an area which is now too small for the company's requirements, and will become increasingly so with the passage of time, while there is no available space for enlargements. More than this, the approaches to the station at right angles to one of the busiest streets in London, and within a stone's-throw of the junction of Trafalgar-square with the Strand, are as inconvenient and dangerous as they could be, and must become more so in the future. South of the river it would be possible for the railway company to obtain a cheap and adequate site with perfect approaches, and the size of the site would enable the company to consult both their own convenience and that of the public. The rateable value of property on the southern side of the river would be much enhanced, while the sale of the present site would produce an immense sum of money, which would go far towards compensating the company for the cost of a new station, and it would be the gainer by being saved the heavy charges involved in the upkeep and repair of a great bridge. This is the practical aspect of the problem, but the æsthetic gain to London would, if anything, be immeasurably greater. As we have pointed out, no more fitting memorial to commemorate those who have fallen in the present war could be imagined than a fine monumental bridge over the Thames at a point where it is badly needed now, while in the future it will inevitably have to be provided at far larger cost if the present opportunity is neglected.

No one can fail to be struck with the unanimity of those who, like Mr. John Burns, have devoted their lives to municipal and public services, Sir William Lever, a typical representative of commercial interests, and architects of established reputation like Sir Aston Webb, Professor Beresford Pite, and Mr. Paul Waterhouse; while to the growing volume of protest are added letters from Mr. Reginald Blomfield, Mr. Ernest Newton, Professor Lethaby, and Mr. William Woodward in the columns of this week's *Observer*. Though the supporters of the Bill would, for obvious reasons, prefer less discussion and more privacy, the General Manager of the South-Eastern Company has been compelled by *force majeure* to write a letter which we can only describe as a half-hearted admission of the weakness of the case of the supporters of the Bill. From it we gather that the company are convinced of the advisability of a great reform, and are proposing to strengthen the existing bridge instead of widening it in accordance with Parliamentary consent previously obtained, in order to give time for plans to be prepared for the removal of the terminus to the southern side of the river, and for the County Council and other authorities to come to some agreement as to the construction of a new road bridge! Frankly we are not inclined to take this optimistic view of the company's motives, but we believe with Mr. Ernest Newton that if the present opportunity is not utilised we shall be saddled with a monstrous anachronism and eyesore for another generation.

If the railway company did not use the powers they had obtained for widening the bridge before the war, presumably they did not do so because the need did not seem to them to be an urgent one; but now that a great London improvement is on the *tapis* they would take steps at a most inopportune time in order to fetter improvement for many years.

Sir Aston Webb stated in his evidence that no one had any authority over London, and it is due to this remarkable fact that public convenience is so frequently sacrificed at the altar of private interests, and we may add that in making the sacrifice private interests are not always attained.

In dealing with such a question as this it will usually be found that if we take a sufficiently broad and enlightened view private interests and public amenities can be met at one and the same time, and this would seem to be the case here. Present arrangements involve the company in the traffic difficulties arising out of inadequate terminal facilities—the upkeep of an expensive and unnecessary bridge, while a better and cheaper site of ample size is available. On the other hand, the development of the southern side of the river is checked and its rateable value prevented from expanding because the railway bridge and station are badly placed. These facts cannot be controverted, and it is on this very practical basis that unanimity of opinion is inevitable to all who consider the question. The statements made by Sir Francis Dent as to the time which the preparation of a larger scheme would involve are scarcely justified. The London County Council have throughout their history shown energy and determination in every case involving the greater interests of London, and even now we are sure would give their consideration to the best method of dealing with the problem; while the services of engineers of standing and architects are available. We are living in times when our constructional works are occupied for the most part with the production of munitions of war, and therefore, assuming it were desired to strengthen the existing bridge, the work could not be proceeded with. But this does not apply to the preliminary discussion of a great improvement which could be taken up without the withdrawal of a single man from national services, while time spent in the consideration of the problem would be of national service in preparing for the problems of peace which will possibly be with us at no distant date.

Those who have given up their occupations and positions in order to serve their country in a time of crisis may reasonably expect that those who are unfit through age or circumstances to help directly should be working for the common good—the future prosperity of the nation—while they are away.

Both the Royal Institute of British Architects and the London Society have taken a leading part in such work, and architects, while contributing a great proportion of thei numbers to the combatant services, have shown foresight an enthusiasm by instituting schemes such as the London Civi Survey and the London Development Plan, which serve th double purpose of affording assistance to those who ar especially badly hit in consequence of the incidence of wa and of preparing useful and necessary data which will b required in connection with the schemes of improvement an development which time has rendered necessary.

Everywhere round us there are signs of life which presen difficulties and trials have stimulated. We may mention th activities of the various town-planning societies, the deter mination to put the housing problem on a sound and workabl footing, and the movement to improve the design of ou commercial products.

But the greatest of all services which we could render t London would be the institution of an improvement which i urgently needed for practical purposes, while at the same tim it would form a better memorial for those who have fallen i the country's service in the great war than anything else whic could be mentioned.

The battle is now joined, and, judging from what has bee already done and the interest and enthusiasm evoked, th prospects of a successful issue are encouraging, thanks to th public-spirited efforts of those who have initiated, at the sacrific of much time, a proposal of the first practical and æstheti importance.*

SIR ROBERT ROWAND ANDERSON, KT. LL.D., R.S.A., ROYAL GOLD MEDALLIST

AN APPRECIATION.

THE bestowal of the Gold Medal of the Royal Institute of British Architects on Sir Robert Rowand Anderson, LL.D., may be looked upon not only as a recognition, long overdue, of his great attainments as an architect, but also as a tribute to Scottish architecture in general.

The doyen of the profession in the northern portion of the United Kingdom, the eminent architect who has thus tardily but very deservedly been honoured has consistently maintained a very high standard of excellence in all the numerous and important works of both a public and private character which he has carried through in the course of a long and successful career, extending through half a century or more. He has also by his example, as well as by his teaching, inspired others to strive to reach the same high level of attainment.

In public affairs his advice has constantly been sought in matters more generally affecting the domain of architecture and its allied arts, and his influence has always been directed towards the support of such projects, for instance, as protected or enhanced the amenities of the city in which he has so long and honourably laboured. It is not too much to say that the upholding there of the tradition of good building, which has always been a living force, has had fresh vigour put into it by his steady endeavour and example.

In a city which enjoys the appellation of "The Modern Athens" it is meet that good architecture should persist, and the history of the Edinburgh of the last hundred years or more shows how much has been done to keep up the excellence of the tradition.

The ancient Guild of the Masons—real masons these were—had up to the latter part of the eighteenth century practically controlled building in the city, and members of the body not only erected the actual structures but very often planned them as well. William Adam, father of the famous brothers Robert and James, was a master mason, and as such both built and designed a large number of country houses and other buildings, many of which are still extant (*vide* "*Vitruvius Scoticus*"). Thomas Mylne, another master mason, was the father of that Robert Mylne, a Fellow of the Royal Society, who practised so long and successfully in London, both as architect and engineer, and ıo was Surveyor to St. Paul's Cathedral, in the crypt of which lies buried. This Robert was eleventh in direct succession this family of master masons, and could trace his descent ɔm John Mylne, master mason to King James III. of Scotland the fifteenth century.

---

* We give among our inset illustrations a drawing by Mr. Raffles Davison, a description of which is given on page 455, and which has been specially prepared for us.—Ed.

But although some, like Mylne and the Brothers Adam, came ıth and found success, many others, equally able, remained beautify their native country and city with fine buildings—ıe both in composition and design and in the manner of their ecution. For while the London of the Regency was being built in brick and stucco a great town-planning scheme was king shape in Edinburgh in a more lasting and beautiful edium, the well-known "Craigleith" stone.

Edinburgh alone can show many fine buildings erected during e nineteenth century, planned by able scholarly men, the uals of Cockerell, Smirke, Barry, and others of their times, ıt whose names are hardly known in the South. The city ves much to the genius of men like Playfair, Hamilton, Bryce, hind, and many other immediate predecessors of Sir Rowand nderson, and he has worthily followed in their footsteps.

Very few architects now living have shown greater activity practice, and fewer can point to such an extensive range executed works of such extraordinary versatility. It is ıpossible here to give anything like a complete list of these, ıd one can only indicate a few of the most important of them.

A Continental tour undertaken in early days produced a ost interesting volume on "Examples of the Municipal, ɔmmercial, and Street Architecture of France and Italy." his book is dedicated to Sir George Gilbert Scott, R.A., who ıd already recognised in the author a promise that was terwards fulfilled, and who had associated him with himself the erection of a large Episcopal church at Leith, near dinburgh.

The reform of Scottish elementary education, initiated by e Act of 1870, necessitated the erection of large numbers of ew schools, especially in the towns, and, as the result of a ɔmpetition under the auspices of the newly-constituted dinburgh School Board, Robert Anderson was awarded st place, and was entrusted with the erection of three large ew schools in the city. The designs of these show the fluence of the tour already mentioned, and the buildings are nongst the most interesting of his many works. He later ected several other schools in various parts of the country.

A more important competition, a few years later, got for im the commission for the new buildings of the Medical School the University of Edinburgh, a fine and most interesting oup, completed in later years by the erection of a large hall ɔr University functions named the "McEwan Hall," after the enerous donor.

Amongst other works done for the University was the ɔmpletion of the old college buildings of Robert Adam and thers by the erection of a large dome over the entrance front. ı his design for this he departed from the type indicated by dam in his original drawing for the buildings which still exists ı the Soane Museum, and he erected a larger and more mbitious structure, and has been much criticised for so doing.

After the burning of the old Mount Stuart House, somewhere ı the seventies, the late Marquis of Bute entrusted Anderson t is said on the advice of Burges, who had himself declined the ork) with the preparation of plans for a very large new ıansion, which has only comparatively recently been completed y the addition of a magnificent private chapel, the interior of hich is lined throughout with white marble.

About the same time the Caledonian Railway Company ere erecting the large new Central Station in Glasgow, and nderson was commissioned to prepare the design for the large lock of offices which were to enclose it on two sides. When ıese had been nearly completed the company decided to ɔnvert the building into an hotel, and this difficult task was arried through by him with considerable success, the result eing the Central Station Hotel, so well known to travellers in ıe West of Scotland.

Amongst other works of a public or semi-public nature ıention should be made of three large buildings, all in Edinburgh —the Scottish National Portrait Gallery, a structure of Gothic ype in red stone; the Scottish Conservative Club, built in the talian Renaissance manner; and the Hall of the Ancient ompany of Archers, the King's Bodyguard in Scotland.

When the competition for the Imperial Institute was arranged for in 1884 Anderson, as the representative Scottish architect, was asked to send in a design, and again in 1901 for the Queen Victoria Memorial.

In church work he has always been active, and in many of the smaller towns of Scotland are to be found interesting churches designed by him for the Episcopalian body. For the Church of Scotland he erected a large parish church at Govan, near Glasgow, and many others elsewhere for the various branches of the Scottish Presbyterian Church. Another notable church of his is the important one belonging to the Catholic Apostolic body in Edinburgh, which contains some very delightful mural decoration by Mrs. Traquair.

The roofing in of the nave of Dunblane Cathedral and the making of it again available for Christian worship after several centuries of ruin was carried out under his direction. He also advised on and superintended the repair of many other notable historical ecclesiastical buildings, such as Jedburgh Abbey, St. Germain's Cathedral in the Isle of Man; King's College Chapel, Aberdeen; the Abbey churches of Dunfermline, Paisley, Culross; St. Virginian Church, Arbroath; the first repairs at Iona, and many others.

He likewise erected many country houses, both large and small, such as Lord Strathcona's highland residence in Glencoe; and his advice was sought by the late King in connection with extensive additions to and improvements of Balmoral Castle.

Many memorials to eminent men were designed by him, amongst others the monument to the great Montrose in St. Giles's Cathedral, Edinburgh.

In town planning his influence has been considerable, two of the largest estates in the neighbourhood of Edinburgh, for instance—Fettes and Braid—having been developed under his guidance during the last thirty or forty years.

He early recognised the importance of having systematic records made of all the principal historical buildings of Scotland, ecclesiastical, municipal, and domestic, and he initiated the preparation and collection of a series of measured drawings and photographs of such buildings. Long years ago he used to encourage his pupils and assistants to devote portions of their holiday-time to such work, both for their own improvement and in order to form the nucleus of what has now become a large and important national collection.

In education his influence has always been exerted to good purpose. In his own office it was his custom to initiate individual responsibility amongst his pupils, who at an early age were given charge of small works, thus drawing out any latent talent and leading them on to think for themselves and to develop instincts which stood them in good stead in later life. Many architects whose names are now well known, both in Scotland and out of it, have to thank him for giving them a fair start in thought and activity of work.

He was largely instrumental in starting the School of Applied Art in Edinburgh under the Board of Manufactures, in which teaching was given by trained architects, and of which he acted for many years as Honorary Director. This School has more recently been embodied in a much larger scheme of technical instruction, on the governing body of which he still occupies an important position.

He has even devoted some of his hard-earned leisure to work of public usefulness. At Tangier, in Morocco, where he had built himself a haven of rest, he initiated, amongst other things, a revival of the silk industry, and himself started plantations for the breeding of silkworms.

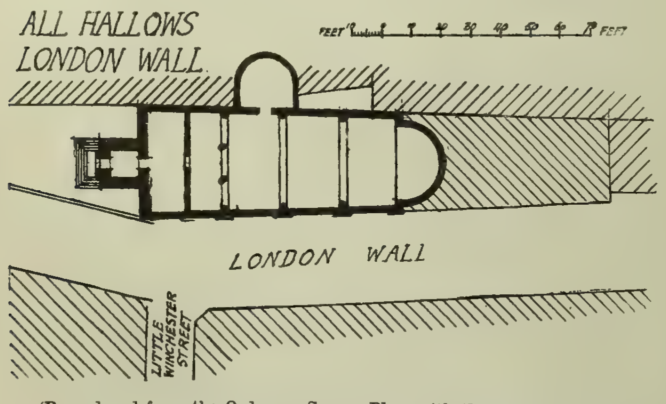
Sir Rowand early became an Associate of the Royal Scottish Academy, of which he is now an Honorary Academician. The University of Edinburgh many years ago gave him the degree of Doctor of Laws in consideration of his services to the University. He was further honoured about fourteen years ago by having conferred on him the dignity of Knight Bachelor as a recognition of his great attainments in architecture. It is well, therefore, that the central representative body in architecture in this country should have given such a very distinguished exponent of the art the highest recognition in their power, thus honouring not only him but themselves in so doing. May he be spared many years to enjoy his numerous honours and the fruits of that leisure which does not always come to everyone after a strenuous and prosperous career!

R. W. S. W.

NOTES.

War Statistics. In these sad times it is well not to dwell too much on our own hardships, but to compare our condition with that of others. Thus although statistics have been robbed of some of their value so far as employment is concerned by the diversion of labour in civil callings to military activity, yet they serve in some respects to enable us to compare our lot with that of other belligerents. In the *Labour Gazette* for June we read that the men still remaining in the building trade were well employed in May, but the German Department of Labour Statistics has to report in April, "No real improvement was observed in the building trades, although in South Germany there was a partial revival." Our trade unions report but 0·5 per cent. as unemployed in May; whilst the German trade unions, with about the same membership, report 2·3 per cent. as unemployed in April. As regards wages, no statistics are available from Germany, but we know here that wages are high; indeed in the five months of this year the net result of the changes in rates of wages was an increase of £140,000 a week, affecting some million and a half workpeople. The building trade has participated in £10,274 of this sum. Any mention of increased wages is, however, always "counter-attacked" by a reference to the increased cost of living. Even so we can turn to a comparison with other belligerent countries for consolation. Taking the country as a whole, and regarding articles of necessity in working-class households, the retail prices of food here in May were 59 per cent. above pre-war level; but in Berlin in April they were 120 per cent. above the prices prevailing in July, 1914. Prices in Berlin are, moreover, not as is the case here, actual prices, as many of the articles listed are unobtainable at any price, whilst in other cases the articles of food are blended with substitutes—in fact, in Germany those asking for bread may well complain that they have received a stone. We commend the above figures to the consideration of the grumblers, if there are any avowed persons of that ilk, and it would certainly surprise our forefathers to learn that in the course of a great European War it was not this country which was starving, but the enemy countries, for in Austria prices are even a trifle higher than in Germany.

Debt and Churches. It is stated on the authority of a Fellow of the Royal Statistical Society that in one denomination, that of the Primitive Methodists, the huge sum of £47,000 annually is needed to pay the interest on money borrowed for the building of chapels. We have sometimes wondered whether it would not be better to build fewer churches and chapels rather than incur the heavy burden of debt which renders the life of a clergyman or minister one of trial. The man who of all others needs quietness for reflection and thought—live he ever so frugally—is often put in the position of a spendthrift who lives beyond his means, and this without having committed any of the follies or extravagances which should bring their just punishment. In one of Harold Frederick's novels, "Illumination," we read how in America the services of a "Debt Raiser" are utilised—that is, a man who combines with glibness of tongue and an ability to arouse the emotions a shrewd business sense, and who travels from congregation to congregation to hold Revivalist meetings. We never see a new church or chapel without reflecting on the immense effort which has been expended in raising funds, and we greatly wish that clergyman or minister could say, "Money is required for a new place of worship; it is your business to provide it if you want to carry on a useful work; it is not my province to deal with such matters." We wonder whether the enlightenment of future generations will draw a line of separation between matters which are so radically distinct as the raising of funds and the giving of spiritual help and advice?



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

Housing Shortage in Newcastle. A local paper complains of the apathy shown l the Newcastle authorities in the matter of housin It is calculated that 4,000 married men, the majori of them with families, are occupying hired roo and that there is a housing shortage of this amou in the city. Our contemporary says the Corporation have be apathetic in carrying out the Walker Housing Scheme. The Committ having the matter in hand could make no satisfactory arrangeme with contractors, and so the Local Government Board ha withdrawn their sanction to the £60,000 loan required in connecti with the building of 300 dwellings. The municipal authorities ha paid many thousands of pounds to the dependents of municipal servan who have gone on active service, and it is urged that if they had tak an equally broad-minded view with regard to the contracts for t Walker Housing Scheme much would have been done to allevia local hardship. It is suggested that the high rate of infant mortali is largely due to overcrowding, and it is asked how we can expe to produce a rising generation of sufficient stamina to carry on t race in such conditions. It seems to us that there is urgent necessi for the relaxation of the enactments which have checked priva speculation in housing, and there is much to be said not only for th but for the policy of granting municipal bonuses to those who w fill in the gap—always providing they do so in accordance with t maintenance of a satisfactory standard of design and constructio In no other way that we can see can the necessary work be carri out without great and even prohibitive cost to the State.

Housing in Dublin. The Honorary Secretary of the Sub-Committee the Dublin Watch Committee writes to a loc paper to say that, though the rebuilding of Sackvill street has been the subject of constant discussio one important aspect of the case has been entirely overlooked. is felt by the writer that any attempt to rebuild Sackville-stre on a grand scale will be money wasted so long as the slum proble is untouched. There were, it is added, in 1814, 37,552 persons wh were occupying dwellings almost unfit for habitation and 22,70 persons inhabiting houses unfit for occupation and incapable of bei improved. When we consider that those who have been rejecte as unfit for active service in the war are in many cases unfit becau they have not lived in healthy conditions, the fact is brought hom to us that it is necessary for the safety of the State to do away wit insanitary conditions at any cost, and future legislation mu more and more recognise the necessity. Intemperance, crime, an disease are all direct products of insanitary conditions, and it is crying shame that in this age modern science and civilised legislatio should not have banished the evil for ever. Hospitals and priso are very largely a recognition of the fact that civilisation has faile and socialism can be most effectively banished by wise and tempera social reform. In the physical and moral well-being of the peop will be found the best assurance of the stability of the State—an en which all should work for.

The Cunard Offices, Pierhead, Liverpool.
Messrs. Willink & Thicknesse, Architects; Messrs. Mewès & Davis, Joint Architects.

HE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. XLI.—All Hallows, London-Wall.

The Church of All Hallows was designed in 65-7 by George Dance, R.A., the architect Newgate Prison. His work shows the fluence of his long stay in Italy, where he ined the Royal Medal of the Academy of ne Arts in Parma in 1763, and was greatly fluenced by the work of Piranesi. All allows is externally a simple brick building, th a stone tower; but its internal design is ceptionally good. A range of engaged Ionic lumns on either side supports a curved ceiling to which large semicircular windows break. ne ceiling is well designed, and a pleasing nse of proportion and refinement of detail aracterises what is one of the most beautiful enaissance interiors in London.

No. XLII.—St. John the Evangelist, Westminster.

The Church of St. John the Evangelist as designed by Thomas Archer, who was .P. for Warwick and was much employed uring the first half of the eighteenth century. rcher was a pupil of Vanbrugh, who appointed m architect for the church, which was one the fifty churches ordered to be built during ne reign of Anne. St. John the Evangelist as built between the years 1721-28, and is id to have cost £40,000. Columns supporting ne ceiling were a part of the original scheme, ut after a fire in 1741 they were removed. alleries were added in 1758 and increased in 821 by William Inwood.

The church is an interesting one, and is ery characteristic of its period. It occupies n exceptional site in the centre of Smith-quare. Its design is vigorous, though coarse, randiose, and expressive of the manner of anbrugh.

THE NEW CUNARD BUILDING.

The Cunard Building is conveniently situated on a site adjacent to the Liverpool Landing Stage and commanding a magnificent view of the Mersey Estuary.

Before commencing building operations the foundations had to be prepared, and it was decided to embed the massive pillars which support the structure in the solid red sandstone which was the stratum underlying the old dock. Arrangements, too, were made by a system of pumping for dealing with any water which might find its way into the old-time excavation, and with these preparations successfully negotiated the work proceeded apace. Operations were commenced in December, 1912, and in June, 1916, the Cunard Company were enabled to move into their new quarters.

The style of building to be erected was a matter of much consideration. Eventually it was decided to embody in the structure, both in general outline and decorative detail, the best features of the Italian Renaissance as represented by the Farnese Palace at Rome. The length of the building from the front façade on the pierhead to the city façade is 330 ft., the width of the former being 170 ft. and the latter 200 ft. The height from the basement is 125 ft., and from the foundations in the bed of the old George's Dock 170 ft.

The design of the building is the combined work of Messrs. Willink & Thicknesse, of Liverpool, and Messrs. Mewès & Davis, of London. The contract for the construction was entrusted to Messrs. Cubitt, of London.

We illustrated this great building in our issues of January 22 and 29, 1915, and consider that a detailed description of the accommodation provided is unnecessary. The Cunard Company is the pride of our mercantile marine, and all will be pleased that its prosperity and importance should be emphasised by the building of new offices. The plan of the new offices is an admirable example of architectural planning.

OBITUARY.

Mr. E. Thornton.

We regret to announce the death of Mr. Edward Thornton, F.R.I.B.A., which took place suddenly in his forty-seventh year. He was the third son of Sir James and Lady Thornton, and was articled to Mr. Rowland Plumbe, F.R.I.B.A. He worked for some years with Mr. A. H. Ryan Tenison, F.R.I.B.A., and for the past nineteen years has been in Calcutta, where he carried out many extensive works.

Mr. W. H. Hillyer.

We regret to announce the death of Mr. Wm. Harold Hillyer (Captain, R.E.), who was killed in action in France. Deceased was educated at Timsbury, Eastbourne, and Dover College. He served his articles with Mr. S. Clifford Tee, of Moorgate-street. He was assistant in Mr. Leonard Stokes's office, and later with Sir Aston Webb. He subsequently started on his own account, practising at No. 8, Buckingham-street, W C. Illustrations of his work, "Brantham Court, Suffolk," appeared in the *Builder* on March 12, 1915.

Mr. E. Willmott.

We regret to announce the death on June 12, at Bramleys, Little Kingshill, Great Missenden, Bucks, of Mr. Ernest Willmott, of Raymond-buildings, Gray's Inn, W.C., aged forty-five years. Mr. Willmott was elected a Fellow of the Royal Institute of British Architects in 1906. He was the architect of the New House, Lympne, for Sir Philip Sassoon, Bart. (conjointly with Mr. Herbert Baker, of Cape Town, South Africa); of the Orphanage, All Saints' Convent, London Colney, near St. Albans, for sixty girls and the resident members of the Sisterhood; houses at Meadway and Great Berkhampsted; and Nos. 80-3, Margaret-street, St. Marylebone, W., for the All Saints' Sisterhood and Religious and Charitable Community. Mr. Willmott brought out five years ago a book on the subject of "English House Design."

GENERAL NEWS.

Professional Announcement.

Mr. Ernest G. Theakston has removed his offices to 12, New-court, Carey-street, Lincoln's Inn, London, W.C. His telephone number is Central 660.

Discovery at Wetherby.

During the making of foundations for the new Council School at Wetherby an ancient stone was found. It is of the Decorated period. At some time, it is stated, it has evidently been used for decorative work above the door or window of some church or abbey.

Arts and Crafts Exhibition Society.

With reference to the forthcoming Exhibition of the Arts and Crafts Exhibition Society in the Galleries of the Royal Academy in the autumn, it may be observed that the Exhibition will be open to all craftsmen, whether members of the Society or not, and that works will be received and exhibited under conditions similar to those of the Summer Exhibitions at the Royal Academy. The address of the Secretary, Professor E. S. Prior, A.R.A., is 1, Hare-court, Temple, E.C.

Architects' and Surveyors' Company in the King's Royal Rifles.

Those of our readers who are liable to be called up at immediate notice under the Military Service Act will be interested to learn that arrangements have been made for the formation of a company of Architects and Surveyors in connection with the 22nd (Res.) Battalion King's Royal Rifle Corps. It need hardly be pointed out that it is of great advantage to recruits to be able to join a company composed of men of their own class, military life under such conditions being much more pleasant. Lieut. and Quartermaster H. G. James (with the permission of the Commanding Officer, Lieut.-Colonel L. Whitehead) has the arrangements in hand, and readers desirous of joining the new company should communicate with him at Norfolk House, Laurence Pountney-hill, Cannon-street, London, E.C. It is necessary to make immediate application. The duties of the battalion are largely in connection with field engineering. The training-ground is at Wimbledon.

Leonardo da Vinci.

On the 15th inst. Mr. Selwyn Brinton gave to the members of the Italian Circle of the Lyceum Club a lecture on "Leonardo da Vinci as Artist and Thinker." The lecture was illustrated by some thirty lantern slides from the pictures and drawings of the master, including some of his studies of flight, from the "Codex Atlanticus." The lecturer, in his concluding remarks, said: "One point has become more clear in my own mind during my recent study of Leonardo. We have seen Pater, Symonds, Muther, and others allude to the unfathomable quality in Leonardo, and I myself, when I published my study of Leonardo and his followers (in 1900), felt very intensely this quality of mystery. But, thinking over this point, it has occurred to me that there is on one side a very clear and sufficient explanation. The Italian genius for three centuries had climbed up to the perfect means of art expression. With Leonardo it had reached the summit; it looked on its own achievement—out and beyond, to the unconquered domain, a forest of shadows and dark mysterious depths, yet unexplored, of nature and of science. Leonardo definitely marks the spirit of modern science in his test of experiment as the only true method. 'It is experience,' he writes, 'alone that leads to simplification, by ways that are frequently very intricate.' But he stops, baffled, driven back on himself by causes beyond his control; by war, anarchy, even worse than these—the free spirit of thought fettered and chained—the Inquisition established in Italy as a method of government; the mind of his age refusing his great gift to it of splendid, illimitable progress."—A vote of thanks to the lecturer was proposed by Mr. A. G. Temple, Director of the Guildhall Gallery of Art, seconded by Mr. W. Warry Stone, and agreed to unanimously.

Masons' Company.

Mr. G. H. Judd has been elected Master of the Masons' Company; the Lord Mayor, Upper Warden; and Mr. Robert L. Hunter, Renter Warden.

"Concrete and Constructional Engineering."

We have received a copy of the June issue of *Concrete and Constructional Engineering* which contains, amongst other useful and interesting material, an illustrated article on the "King's College for Women, Kensington," by Mr. Ernest G. W. Souster, A.R.I.B.A.; Part II. of a valuable article entitled "Researches on Reinforced Concrete Beams, with New Formulæ for Resistance to Shear," by Mr. Oscar Faber, D.Sc., A.M.Inst.C.E.; and an interesting article—the third of a series—under the heading of "Concrete the Money-Saver." This contribution deals with the adaptability of local materials and their application for general purposes, and it is well illustrated. The author of the article is Mr. Thomas Potter.

Town Planning at Chelmsford.

The Chelmsford Town Council have adopted a report from the Town Planning Committee which stated that, having discussed the question of applying to the Local Government Board for sanction to prepare a town-planning scheme, they had deferred the further consideration of that matter. In the meantime they had requested the Chairman, Town Clerk, and Surveyor (Mr. Percival T. Harrison) to have an informal interview with representatives of the Great Eastern Railway to ascertain what developments are likely to be made by the company in Chelmsford in the future, in order that, if possible, these may be made in conjunction with proposals which the Town Council may subsequently desire to insert in a town-planning scheme.

All Hallows, London-Wall, E.C. (*See page* 453.)

South African Hospital.

The South African Military Hospital
just been officially handed over to the W
Office. The hospital has accommodation
304 beds. The architect is Mr. Allison, a
Mr. McFerran is the engineer.

Organisation of British Engineering Industr

Mr. F. Dudley Docker, C.B., Chairman
the Metropolitan Carriage, Wagon, and Finar
Company, Ltd., has joined the Committee
the Council for the Organisation of Briti
Engineering Industry.

Mr. Ernest Newton, A.R.A.

The Minister of Munitions has appoint
Mr. Ernest Newton, A.R.A., President of t
Royal Institute of British Architects, in
voluntary capacity to advise the Ministry
various problems arising out of the stoppa
of private building operations.

Reconstruction after the War.

"Reconstruction after the War" was t
subject of a lecture delivered by Profess
Patrick Geddes in the Royal High Scho
Edinburgh, recently. Professor Geddes sa
that the military preparations of Europe befo
the war were reckoned as the equivalent in co
and labour of ten Panama Canals per annu
and now, in war-time, certainly at least 1
probably more. Thus the war revealed to
the magnitude of our possible reconstructi
resources and energies. Strange as was t
economic paradox, the great constructions
the world had by no means always been ma
in time of peace and wealth, but rather aft
war and in poverty. The French architects a
town-planners had long been busy, so that t
exposition of the cities reconstituted was open
by the French President recently.

Memorials to Admiral Cradock.

The memorial to Admiral Sir Christoph
Cradock that Lord Zetland unveiled in Yo
Minster on June 16 is placed beneath the o
chimney clock in the north transept. It
the joint work of Mr. F. W. Pomeroy, A.R.
and Mr. Walter Tapper, F.R.I.B.A., archite
to the dean and chapter, and consists of
mural tablet, 12 ft. 6 in. by 6 ft. 6 in., of pu
Derbyshire alabaster; the central panel bea
a bust, executed in Saravazzi marble, of t
late admiral, and in niches at the sides a
gilded figures of loyalty and courage. T
inscription commemorates the Admira
gallant attack, when in command of the *Go*
Hope, of the enemy's forces off Coronel, ne
the Falkland Islands, on November 1, 191
The marble tablet recently set up in Hartfor
Church, near Richmond, Yorks, was design
by Mr. W. S. Weatherley, F.R.I.B.A., a
executed by Messrs. John Underwood & So
of Baker-street, W., in Rosso Antico marbl
and marble from the ancient quarries ne
Athens.

The Leeds and West Yorkshire Architectur Society

The annual general meeting of this Socie
was held on June 15 at No. 5, Greek-stree
Leeds, Mr. G. F. Bowman in the chair. M
Whitehead presented the annual Report
the work done by the Society for the past yea
and mentioned the fact that at last the Depar
ment of Architecture at the Leeds School
Art, under Mr. G. J. Coombs, has receiv
recognition from the Royal Institute of Britis
Architects, and is the first provincial school
art to obtain same. Mr. R. Fielding Farr
presented the annual balance-sheet, which w
adopted, and it was proposed, seconded, a
approved that a sum of £150 be invested
the War Loan. The following officers we
elected for the ensuing year:—

President—Mr. G. Fredk. Bowman.

Vice-Presidents—Messrs. J. F. Walsh, F.S.
C. B. Howdill, A.R.I.B.A.

Hon. Treasurer—Mr. R. Fielding Farra
A.R.I.B.A.

Hon. Librarian—Mr. G. J. Coombs, A.R.C.

Hon. Secretary—Mr. Wm. Whitehea
A.R.I.B.A.

And the following members of the Council-

The Charing Cross Improvement.

THE sketch suggests some of the possibilities which a great clearing-out scheme at Charing Cross would bring about. Not only would the utlook from existing properties, such as the ational Liberal Club, Whitehall Court, and the otel Cecil, be vastly improved, but new building tes of the greatest value would be created. The te on the eastern side of the new *place*, corresponding with that of the National Liberal lub to the west, would be an ideal one for a reat hotel or club. Between this and the otel Cecil a shallow crescent of new buildings ight be built which would form either plendid suites of residential chambers or even great public building. Overlooking the public ardens of the Embankment and accessible from he Strand level this position would be one of utstanding importance and value. Then the ngle building where the new street up to the trand joins Northumberland-avenue would ave a commanding outlook, whilst the new rontages created on each side of this new treet would be of exceptional value.

The other aspects of the scheme—the nbroken continuity of the Embankment ardens—the creation of a great *place*—the evelopment of a magnificent vista from rafalgar-square, down Northumberland-venue, across a great road bridge to the outh side of the river, possibly leading p to an Imperial Senate House—the rection of a National Memorial Chapel o our fallen soldiers in the centre of the *place*, s suggested by Mr. Lewis Hind in the *Daily Chronicle*—these are some of the artistic assets f the scheme.

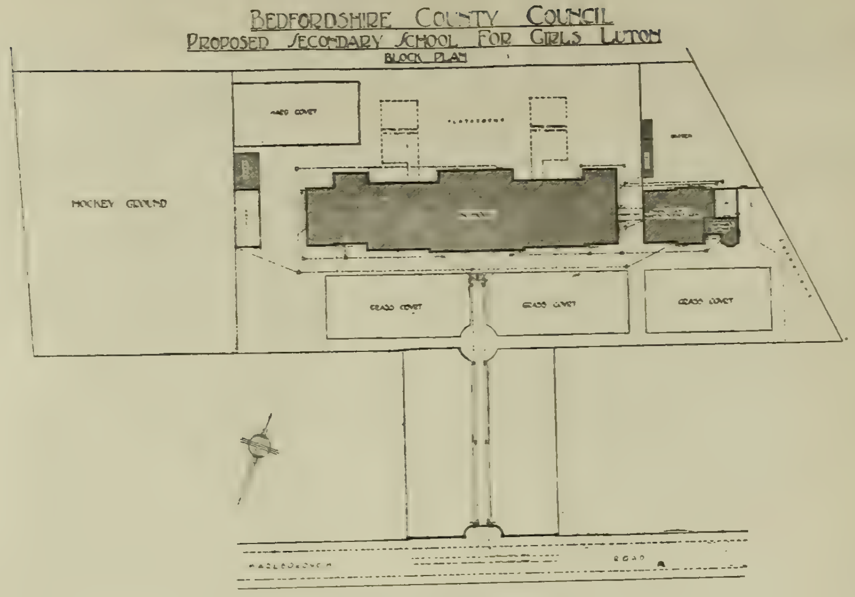
It is difficult to see how any scheme for a high-level bridge could be generally approved. Having once got rid of the present "red oxide behemoth," with the congested mass of mean buildings and underground tunnels and arches behind them, could it possibly be wise to obstruct the views and spoil the land values once more for the doubtful result of cutting off the direct communication between the embankment and the new bridge?

Surely, if ever in the history of London there has arisen an opportunity to stir the pulses and rouse the imagination of her citizens it is to be found in the present issue at Charing Cross. In applying for leave to tinker up and preserve the bridge I cannot but believe that the railway company are riding for a fall. And almost one thinks that if London does not wake up to its chances at such a time as this it deserves the fate which will befall it.

T. RAFFLES DAVISON.

The Work of Sir R. Rowand Anderson, LL.D.

WE give three illustrations of work by Sir R. Rowand Anderson, LL.D., this year's Gold Medallist. We should have liked to give much fuller illustrations of the contribution which Sir Rowand has made to the sum of modern architecture, and hope at a later date to illustrate some of his other work.



First Premiated Design.

By Messrs. J. R. Brown & Son.

Drawings by C. E. Mallows.

WE give a further selection of reproductions of the admirable collection of drawings by the late C. E. Mallows, whose untimely death is a loss to the architectural profession.

Luton Secondary School for Girls.

THE arrangement of plan, with a wide central corridor on each floor giving access to the several rooms, was adopted with a view to simplicity of design and efficiency in the general supervision of the school. The assembly hall, which is also to be used as a gymnasium, is placed within easy reach of all entrances, and in addition to the side windows has a large window at each end above level of adjoining flats, thus securing good lighting and ventilation. The classrooms are placed on the south side of the building. The architects are Messrs. J. R. Brown & Son, of Luton.

ral MEETING of the Royal Institute Architects was held on Monday Conduit-street. Mr. Ernest Newton in the chair.

Deceased Members.

y Dawber said that before coming dinary business he would ask the record its profound sorrow at the stitute had sustained by the tragic Lord Kitchener and Sir H. F. Lord Kitchener was elected an ow of the Institute in 1910, and Sir onaldson, who perished with him, an Hon. Associate since 1896. At Planning Conference held at the n 1910 Lord Kitchener, who was held very enlightened views on the ook the chair at one of the meetings per on the planning of Khartoum and he himself contributed a most r address. Sir H. F. Donaldson touch with the Institute in 1895 at the brickwork tests. He was then the London and India Docks Joint , and he secured them the use of a ground on which to conduct their ts, and he took an active part in iments, which brought out some nts.

te of condolence was passed in

wber also announced the deaths of ard Thornton, of Calcutta, elected te in 1892 and Fellow in 1904; and . Willmott, Fellow, elected in 1906.

Presentation of the Royal Gold Medal.

esident said: "My Lord Provost. d Gentlemen,—We are assembled afternoon to do honour to a tish architect, Sir Rowand Ander- regret very much, and I am you regret also, the absence wand on account of illness, and will wish those who represent is occasion to convey to him our and to tell him that, although his s given us the pleasure of welcom- obert Inches, the Lord Provost of n, who has so kindly honoured us by pressly to receive the medal on Sir behalf, and Mr. Lorne Campbell, ead Sir Rowand's address, we were rward to the occasion as an oppor- testifying personally to him our for his work as an architect and riation of the great services he has do architecture. This is the second which I have had the honour of the Royal Gold Medal, and each s had this special point of interest. the recipient was Mr. Frank ho was the first Canadian architect this mark of the esteem of the titute of British Architects. This medal in being conferred on Sir Anderson goes for the first time Border.

ione of those occasions on which the r is not expected to do more than prefatory remarks before present- dal, and he then leaves the field to it Sir Rowand Anderson has had g and distinguished career that it is condense even introductory remarks oming length. He was born in the ear 18 and I have obtained from him, in his own words, the following interesting sketch of his career :—

"Like some others, I was not brought up to architecture in the recognised way—that is, by means of an apprenticeship—but was articled to a lawyer in the hope that I would follow a legal career. After four years spent in what to me was the most uncongenial work, my parents recognised the inevitable and allowed me to follow the profession of architecture.

I became a pupil of a teacher of architectural drawing, and entered also the Architectural Section of the School of the Board of Manufactures, the precursor of most of the schools of design in this country. I afterwards left for a year's residence in Italy and France, where I spent my time in measuring and drawing work of the Renaissance and Mediæval periods.

On returning to Edinburgh I spent some time in several offices, took part in some competitions, gained some and lost others. In 1875, when the new schools were being built under the Education Department, I was invited to enter a limited competition of six. I came out first, and the carrying out of three of the largest schools was entrusted to me.

In 1878 the University of Edinburgh launched a large new scheme for housing all their medical classes in one building, and invited six architects to submit plans for the same. I was one of them. Previous to preparing my plans I made an extensive tour in Germany, France, and Holland to examine and make myself acquainted with the new buildings that had been erected at the centres of education there, so that my design might be applied to the new methods of teaching.

My plan, which was based entirely on the use to be made of these buildings, carried the day, and I was appointed architect. Later on I was asked to design and carry out the great Graduation Hall, known as the McEwan Hall, and other buildings for the University, and also for the University College at Dundee.

As architect to the Board of Manufactures I designed and carried out the Scottish National Portrait Gallery and National Museum of Antiquities, Edinburgh; also the restoration of the cathedral at Dunblane, which at the time was under their jurisdiction. These were followed by a number of public and private buildings."

A complete list of Sir Rowand's works will appear in our *Journal*, but amongst them the following demand particular mention :—

Public Buildings.—New Medical School, Edinburgh University. He won this in competition, and the buildings have cost in all nearly £1,000,000. (Included in this group is the well-known McEwan Hall.) The Central Station Hotel, Glasgow; the Scottish Conservative Club, Edinburgh; the National Portrait Gallery, Edinburgh; the Pollokshaws Town Hall.

Churches.—The Catholic Apostolic Church, Edinburgh; the Govan Parish Church; St. Paul's Church, Greenock; Glencorse Parish Church; Inchinnan Parish Church; St. James's Episcopal Church, Inverleith; the Episcopal Church, Stirling; the Episcopal Church, Colinton; the Episcopal Church of St. Andrew's, Kelso; the Episcopal Church, Forfar; the Episcopal Church of St. Augustine, Dumbarton; the Episcopal Cathedral Church of St. Andrews; All Saints' Church, Parsonage, and Schools, Edinburgh; St. Margaret's Roman Catholic Church, Dunfermline.

Public Memorials. — The Buccleuch Memorial, Edinburgh; the Montrose Memorial, Edinburgh; the Inglis Memorial, Edinburgh.

Domestic Work.—Mount Stuart House, for the Marquis of Bute; a mansion at Glencoe for Lord Mountstephen.

Restorations.—He has carried out important restorations at Dunblane Cathedral; King's College Chapel, Aberdeen; Bothwell Collegiate Church, and at Jedburgh and Kelso.

Schools.—In the early part of his career he carried out several large schools for the Edinburgh School Board.

One might have thought that the carrying out of such a formidable list of important works would have been sufficient to absorb the energies of any ordinary man, but, with all these heavy responsibilities, he nevertheless found time to devote to the improvement of architectural education in Scotland.

The Edinburgh School of Applied Art, now merged in the Architectural Section of the Edinburgh College of Art, owes more to him than to any other man, and many of the schools since started throughout the country are based on the principles laid down by him.

He presented a valuable collection of architectural books and casts to the School, as well as a large number of measured drawings of Scottish ecclesiastical and mediæval buildings, prepared at his own cost. These drawings now form the greater part of the collection of the National Art Survey of Scotland; they are of great educational value, and a lasting record of buildings many of which have already disappeared.

I wish I could speak from a personal knowledge of Sir Rowand's actual buildings, but such is my incurable distaste for travel and adventure that I blush to have to confess that it is more than forty years since I made my first and only visit to what was then rather a far country. I will therefore avail myself of the appreciation of one who has been more fortunate in this respect than I have, and who gives as the characteristic quality of his work its evident integrity, each building being thought out for its special purpose with a simplicity and directness of conception which dominates the whole design, the beauty of any particular *motif* or the careful study of its detail never being allowed undue prominence, each work being eloquent of the conscientious study of the requirements and purposes of the building and of his knowledge of and sympathy with the various crafts employed.

It is not too much to say that his work and teaching have not only influenced large numbers of architects now in practice, but that many of the building firms in Scotland owe their capacity for fine craftsmanship and selection of material to his work and guidance.

As a proof that this high view of Sir Rowand's attainments is shared by others outside Great Britain it is only necessary to mention that he has been awarded medals in Paris, Munich, and Chicago. Our own country, true to her traditions, is the last instead of the first to mark the appreciation which it has long felt for one of Scotland's most eminent architects.

My Lord Provost, I now have the pleasure of presenting this—His Majesty the King's Gold Medal for Architecture—to you as representing Sir Rowand Anderson. I should like you to tell him that it was awarded to him by the unanimous vote of the Council and of the members of the Royal Institute of British Architects, and that we are proud to have his name on the roll of those who have been honoured by this distinction."

The President then presented the Gold Medal to the Lord Provost of Edinburgh for Sir Rowand Anderson.

Appreciation by Sir Aston Webb.

A letter was read by the President from Sir Aston Webb, who expressed regret at his inability to be present. He said he had had the honour of knowing Sir Rowand Anderson for some years, and asked to be permitted to take the opportunity of expressing his respectful admiration for his work, not only as an architect—in which he, of course, excelled—but also for his work in the cause of education and for the high example he had set for them during his long life.

Address by Sir Rowand Anderson.

Mr. Lorne Campbell, who read an address prepared by Sir Rowand Anderson, prefaced his task by expressing the regrets of Sir Rowand at his inability to attend. Sir Rowand had asked him to read the address as a fellow-architect and a personal friend.

Sir Rowand Anderson wrote :—

"Mr. President, Ladies, and Gentlemen,—This unexpected and great honour which has come to me from the King acting on the advice of this Institute, and the generous and appreciative remarks of the President, and the reception you have given to them, make it very difficult for me to frame an adequate reply.

This Gold Medal may be justly looked upon as the blue ribbon of the profession. It is not a political or social honour like the blue ribbon of the Order of the Garter, of which Lord Melbourne, Queen Victoria's first Prime Minister, on the occasion of the selection of someone to fill a vacancy in that exalted Order, said there was no difficulty in making a selection, as there was no 'damned merit' about it. Now, quite the contrary is the case here. Merit, you say, is the sole title recognised by this Institute. The difficulty in making a selection from a body where so many are worthy of the honour is great, and on the list there is no name that does not reflect the care with which it has been chosen and with which it is not a great honour to be associated.

Our President has told us that this is the first time that the Royal Gold Medal has crossed the Border. That is an additional reason why I should feel proud to be the one selected for it, and this unique event gives me an opportunity for pointing out to you that, although this is the first time that such an honour has crossed the Tweed northwards, there has been a steady flow southwards from Scotland of much architectural talent, contributing greatly to the advancement of our art. From the time of the Union of England and Scotland, which was largely accomplished by intrigue and bribery, but has nevertheless resulted in great blessings to Scotland as well as to England, the road to the South became the great highway for Scotsmen in search of fame and fortune, and, in spite of much opposition and prejudice, many found them.

The first man I should refer to is Sir William Bruce, of Kinross, a contemporary of Sir Christopher Wren. His connection with England is very slight. He appears to have done some work at Ham House, in Surrey, for Lady Dysart.

The next name of any consequence is James Gibbs, of Aberdeen, born 1674, died 1754. He studied for some years in Rome, and returned to London in 1710, where, under the influence of his early patron John Erskine, Earl of Mar, he soon rose to fame.

Colin Campbell, a Glasgow architect, well known as the author of *Vitruvius Britannicus*, under the patronage of the great chief of his clan, the Duke of Argyll, removed to London and carried on a considerable business as an architect.

The Mylne family have a long and continuous connection with building and architecture. A Mylne appears as master mason to King James III. of Scotland. His family can be traced down to the end of the eighteenth century, and had a hand in almost everything, such as royal palaces and castles, town halls, etc., etc., and many bridges. Robert Mylne, a descendant of the master mason of King James III., was born in Edinburgh in 1733. After about four years studying architecture in various parts he returned to England in time to take part in a competition for the new Blackfriars Bridge, and was successful against sixty-nine competitors. From this time work flowed in on him, and in 1766 he was appointed Surveyor to St. Paul's Cathedral, and it was he who suggested the widely-known epitaph to Sir Christopher Wren. He has a further claim to the remembrance of this Institute, as he was an original member of the Architects' Club, founded in 1791, which dined once a month in the Thatched House Tavern during the season, out of which gathering grew the present Institute.

The next best known name is that of Adam: the three sons of William Adam, of Maryburgh, in Fife, an architect of great repute, with many good buildings to his credit. These brothers made their descent on London in 1768. Their influence on architecture exists to the present day. A Wren church and an Adam house still hold their own.

I could prolong this list, but will close it with the names of two men who have done much to deserve to be remembered and held in esteem—the late R. Norman Shaw and J. M. Brydon, both of them my countrymen.

You have been good enough to include my services to architectural education as one of the qualifications for my receiving this Gold Medal. I acknowledge most gratefully your reference to this. I began to take an interest in architectural education in 1892. South Kensington up to that time had the entire control of art education, but the education they gave never seemed to produce any result beneficial to the architectural student, and it is not difficult to see why this was so. The system of payment by results poisoned the whole thing. The teacher's income rose and fell according to the number of the prize drawings produced by the student. These had to be worked up to a standard of excellence, as drawings, to meet the views of the examiners in London. So it eventually came to pass that the school existed for the benefit of the teacher more than for the taught. The hopelessness of expecting anything to come out of this system of teaching as regards architecture culminated in 1892. A number of architects and others, including myself, with the aid of the Board of Manufactures, then combined to start a school entirely free from the baneful influence of South Kensington. I should here inform you that the Board of Manufactures came into existence about the time of the Union of Scotland and England, and administered some of the money known as the Equivalent Grant for the Advancement of the Arts and Industries of Scotland. In addition to what this Board was able to do for us, a fair amount of money was subscribed by those interested in this new departure. But the scheme was nearly wrecked by the difficulty of getting a Director of sufficient standing and acquirements for such a salary as we could afford. So, to prevent the collapse of this promising movement, I was asked, and undertook, to act as Honorary Director. I gave as much time as I could possibly spare to what has always been to me interesting work. With the assistance of one or two paid teachers a start was made. From the very first the scheme caught on. It gradually became recognised by the student as the best means of getting an education to supplement what he was acquiring as a pupil or apprentice in a private office. It would take up too much of your time if I gave a detailed account of the school work, but I shall allude to one or two of the leading features of it. In the beginning of my architectural career I kept myself in contact with the best work of the past by spending all my spare time in sketching and measuring both at home and abroad, including a year in Italy and France. There was no golfing for youth in those days. Knowing the benefit I derived from this, I thought we could not do better than make the study of old work the basis of our teaching. With the consent of the committee this was done.

Another important feature in our teaching was the organising of a scheme for obtaining accurate records of buildings erected previous to the eighteenth century. This was called a National Art Survey. It was a very ambitious scheme, but it worked out all right. Two of the best draughtsmen were selected annually, and to enable them to devote their entire time to this they were paid small salaries, and in addition an allowance for travelling and incidental expenses. All the drawings made by them became the property of the school. This work has been going on since 1894, but has been stopped for the last two years owing to the war. There are now something like two thousand sheets, forming, I should say, the finest collection in this country. It contains, in addition to the surveys of the buildings, a large collection of drawings and details of early plaster-work, wall panellings, fireplaces, and a most interesting collection of old furniture to be found in buildings still inhabited. The result of all this has been most stimulating. I never knew a more enthusiastic or industrious set of students. The work they produced was of a very high standard of excellence, and some of them secured many of the coveted prizes which you offer here to competitors from all quarters. On leaving school the students have always been greatly sought after as assistants. They are scattered all over Britain and its colonies, and from letters I have often received they all attribute their success to the sound practical education they had received.

I have always contended that the degree of beauty we see in our buildings and the satisfaction we derive from them depend largely on their fitness and the more or less successful expression of the purposes that call them into existence. One or two examples from my own town of Edinburgh will bring my meaning home to you. Take the Royal High School and the Surgeons' Hall, both of which belong to the period of the Greek revival. They were designed by men thoroughly educated in the art of their day. Looked at as abstract pieces of design they are of the highest order, but the façades of these buildings are not the product of the buildings they are attached to. They are mere screens to mask what is behind them, and that might have been anything other than what is actually there. Now, let us take a look at the great valley that divides the old from the new town. Overhanging the steep cliffs of the Calton Hill is seen what looks like a castle. As a matter of fact it is mistaken by many who enter Edinburgh for the first time by the North British Railway to be the world-wide-known Edinburgh Castle. It is actually the Calton Jail. I remember meeting the late Mr. Billings, the architect, and author of "The Baronial and Ecclesiastical Antiquities of Scotland," a work which had a great influence on the domestic architecture of Scotland for many years during the last century. I had just before then seen a building of his erected for a waterwork. It took the form of a castle. I asked him why he made this work like a castle and not something evolved out of the use of the building. He replied, "Can you tell me what a waterwork is like, as I must have a type to work from?" As I could not do so or convince him that, as he ought not to build a waterwork like a castle, he might at least approximate to something characteristic of the purpose of the building, I had to retire from the dispute, leaving Mr. Billings quite satisfied that his imitation castle with a high tower was a very good representative of a water-pumping station. The architect of the Calton Jail, the building I have referred to, under the influence of the prevailing taste of the day, must have looked at the problem he had to solve from the standpoint of working from a type, and so he chose a castle, but, as a castle is a building to keep people out and a jail to keep people in, see what a deplorable result: one of the finest sites in the world covered with a toy castle, devoid of expression and utterly meaningless.

Again, if you take the plans of the old Scottish castles or mansions of the sixteenth and seventeenth centuries, you can read them like a book from the foundations to the chimney-pots. You can distinguish the original tower that the family once lived in and held its own against all comers. On further examination you will notice an addition made when the family became richer and times were not so warlike. As time rolled on and it was no longer necessary to provide for defence you will find larger additions. But now everything is done for comfort, as understood in those days, and a peaceful country life, the whole group becoming wonderfully picturesque; but it was never built to look picturesque or interesting; it was built from time to time to suit the necessities of the day and the means of the family, and hence its resulting picturesqueness. Contrast with this the mansions erected in imitation of the old ones, and try to read them from the inside to the outside or the reverse. You cannot do so, as the one contradicts the other. The whole thing is a modern house, a very modern house masquerading as a castle of a territoria baron, and so you have everything in these buildings that is false, misunderstood, and misapplied, the result being a costly delusion that such a building is true art and i harmony with the traditions and scenery o the country.

The aim of the teaching in the school wa to counteract this sort of thing by teaching the students to look at buildings with a analytical eye and to dissect them as medical student does his anatomy, and t realise the ideas and purposes that call th buildings into existence. The seed sown b this school and others which have wisel adopted our system of teaching was bearing good fruit before the outbreak of this terrible and unjustifiable war, and there were signs everywhere in Scotland that we had begun to develop architecture, especially in domestic work, on right lines with a distinct national bias. The contention that Gothic and not Italian, or *vice versâ*, was the only state fit to be used in this country has spent itself, and there is now better Gothic and Renaissance work being done than during the period of the Battle of the Styles, as well as a growing absence of those inconsistencies I have alluded to, and I believe we can now look forward to our buildings becoming more and more characteristic of their age and purpose. With these few and inadequate remarks I again offer my grateful thanks to His Most Gracious Majesty and to this Institute for the great honour conferred upon me to-day, an honour well worth a lifetime of earnest labour and thought, to advance art."

Sir J. Burnet, in proposing a vote of thanks to the Lord Provost of Edinburgh, said the inception of the School of Applied Art in 1892 was due to Sir Rowand Anderson, and, although he was supported by others in his scheme, had it not been for Sir Rowand undertaking to act as Honorary Director the School could not have been carried on. That he should have found time to fulfil the duties of such a post and to continue as a member of the College of Art until 1913, thus giving those many years to the cause of architectural education, was all the more remarkable when it was remembered that during those years his greatest work was being carried out. That the head of the great Corporation of Edinburgh should come specially to London to receive the Gold Medal on behalf of Sir Rowand was a proof of the esteem and respect in which he was held in Scotland.

Mr. J. A. Gotch, in seconding the motion, remarked that it must be a great privilege and a great delight to be Lord Provost of Edinburgh—a city full of ornaments so renowned in history and blending in so singular a way the charm of the past and the prosperity of the present. To the lovers of Scott Edinburgh must always be a city of enchantment, and he was sure they were all convinced that such a noble heritage could not have fallen into better hands.

The vote was carried unanimously.

The Lord Provost, in reply, said it had given him great pleasure to come there and take possession of that Gold Medal. He was associated with Sir Rowand Anderson in the starting of the Applied Arts School, and nothing was more gratifying to the citizens of Edinburgh, and especially to those who took an interest in applied art, than the fact that he came forward and offered himself as Director of the School. He did that without fee or reward, and he presented very many valuable specimens, not only in the way of photographs and drawings of architecture, but pieces of colour, because colour scheme was a great part of their scheme. Sir Rowand Anderson devoted night after night to the instruction of those students, and he (the speaker) believed that many of them took prizes either from the R.I.B.A. or some other institute in London. It was impossible sufficiently to express their gratitude to Sir Rowand for all he had done for Edinburgh, and particularly for what he had done to improve not only the architecture but the architects of the city. He had always been a tower of strength, and he had never been known to give way on a point that he thought was really vital in the matter of architecture. He had presented the city with four halberds, which were always carried in front of the Lord Provost, etchings of which were hanging in that hall. He could assure them that he had come there with the greatest pleasure; his only regret was that Sir Rowand Anderson was not able to be there himself. When, however, they considered that he was eighty-three years of age, and that he had been a man who had worked up to the last, they would agree that when the doctor told him he was not to come the best thing he could do was to stay at home.

The President said that was the last meeting of the session, and the arrangements for the new session would be published in due course.

WAGES IN THE BUILDING TRADE.

Birkenhead.—At the recent quarterly meeting of the National Board of Conciliation for the Building Trades an appeal was heard from the carpenters and joiners, stonemasons, and bricklayers of Birkenhead for an advance of wages and alterations of rules. The advances asked for were:—Carpenters and joiners from 11d. to 1s. 3d. per hour, masons from 11d. to 1s. 1d. per hour, bricklayers from 11d. to 1s. 1d. per hour. The case for the operatives was stated by Mr. Dobson (carpenters and joiners), supported by Messrs. Roberts and Robinson (carpenters and joiners), Tyles and Snape (bricklayers), Newnes and lamb (masons). The case for the employers was presented by Mr. Snape, supported by Mr. Fleming. The arguments and essential facts brought forward were substantially similar to those set out in the Liverpool case given below. After considering the evidence the Board decided:—"That the appellant operatives receive 1d. per hour advance as from May 1, 1916, the proposed alterations to the other rules being dropped."

Cheltenham.—Mr. Charles Doughty, the arbitrator appointed by the Board of Trade to decide certain matters in dispute between the Cheltenham Master Builders' Association and the Cheltenham Building Trades Joint Committee, issued his award on May 30, fixing the rates of wages to be paid as follows:—(1) Plasterers and plumbers, 9¾d. per hour, painters 9¼d. per hour; (2) labourers, 6½d. per hour, and scaffolders, stone-sawyers and drainers, 7d. per hour, and to these men, in addition, extra war wages of 4d. per day for every day upon which full time is worked at ordinary rates.

Erith, Dartford, and Bexley.—The arbitrator appointed by the Board of Trade to decide certain matters in dispute between the master and operative painters in these districts issued his award on June 5, deciding that the standard rate of wages to be paid to skilled painters and decorators shall be increased from 8d. to 9d. per hour, such increase to be regarded as war wages and recognised as due to and dependent on the existence of the abnormal conditions now prevailing in consequence of the war.

Liverpool.—An appeal by the carpenters and joiners, stonemasons, bricklayers, slaters, and wood-cutting machinists for an advance of wages and alterations to the working rules was heard by the National Board of Conciliation for the Building Trades at its recent quarterly meeting. Mr. Dobson (carpenters and joiners) conducted the case for the operatives, and was supported by Messrs. Wallis and Robinson (carpenters and joiners), McConville and Caulfield (bricklayers), Whittaker and Challoner (machinists), De Luce (slaters), Ashcroft and Foxcroft (masons). The demand for an advance of wages was of 2d. per hour, the existing rates being mostly 11d. per hour, the machinists, however, having a graded rate which they desired changing to a flat rate, and the slaters' existing rate being 10½d. per hour. The demand was based upon the state of trade, cost of living, and extraordinary conditions prevailing, especially in the shipping, where men were earning high wages. Facts and figures were advanced in support of the appellants' contentions, and the various proposed alterations in the rules were dealt with in detail and reasons given for their demand. For the employers Mr. Moss conducted the case, and was supported by Messrs. Brown, Stirling, Costain, Hall, Morrison, and Johnson, all employers in Liverpool. The defendants, whilst not unsympathetic to the claims advanced by the operatives, urged that this is not an opportune time to grant these demands. That if sympathy was due to the operatives in the present extraordinary circumstances, it was also due to the employers, who were being hit hardly by the fact of having pre-war contracts to carry out under war conditions and upon a rapidly rising and unstable market. There was a great decline of turnover in the building trade, but standing charges remained much the same. Labour was scarce, and not so effective in the matter of output as previously, and there was also the competition of lower-paid districts to contend with. The witnesses having retired, the Board considered the case, and the following was carried and became the decision of the Board:—"That the appellant operatives receive 1d. per hour advance as from May 1, 1916, the proposed alterations to the rules being dropped with the exception that the marble polishers be included in the masons' rules."

London.—At the recent quarterly meeting of the National Board of Conciliation for the Building Trades an appeal was heard from seven sections of the London operatives for an advance of wages and alterations of the working rules. The demands in respect of wages were:—Bricklayers for an increase from 11½d. to 1s. 1½d. per hour, carpenters and joiners from 11½d. to 1s. 1d. per hour, plasterers from 11½d. to 1s. 1½d. per hour, smiths and fitters from 9½d. and 10½d. to 1s. per hour, stonemasons from 11½d. to 1s. 1½d. per hour, labourers from 8d. to 10d. per hour. In the case of the wood-cutting machinists the appeal was for the insertion of a graded set of rates implying an advance of about 1d. per hour. The plasterers, not being affiliated to the Conciliation Scheme, were not represented at the hearing, but had agreed to accept whatever award was made to the other trades. The case for the appellants was stated by Mr. Stennett (carpenters and joiners), supported by Messrs. Murrey (stonemasons), Lane (bricklayers), Dagger (machinists), Haggerty (labourers), and Massey (smiths and fitters). The demand was based upon the same reasons as those advanced in the Liverpool case reported above, and upon the fact that provincial rates of wages in some of the large cities were up to or nearly up to London rates, whereas London was a relatively more costly place for the workers. The various alterations proposed in the other rules were explained and reasons given why they were desired. In the case of the machinists, the plea was for a substitution of a recognised machine rate instead of an unrecognised and fluctuating man rate. For the employers Mr. Renshaw replied, and was supported by Mr. Thorne. The arguments may be shortly stated by saying that in the respondents' opinion this was not an opportune time to consider demands of this kind, which they thought ought to stand over until after the war. They traversed the claim that London was a dearer place to live in than large provincial cities. The witnesses having retired, the Board considered the case and, after a deliberation lasting more than six hours, the following resolution was carried:—"That the appellant trades be granted an advance of 1d. per hour as from the termination of their respective notices, such advance to be for the period of the war and to continue until nine months after the declaration of peace, the rest of the rules to remain unaltered; but it shall be in order for either side, six months after the declaration of peace, to give notice, in the usual way, for an alteration of rules notwithstanding anything to the contrary in the rule as to notice therein contained." The respective dates of termination of notices are as follows:—Bricklayers, July 14, 1916; wood-cutting machinists, smiths and fitters and labourers, July 15, 1916; stonemasons and plasterers, July 17, 1916; carpenters and joiners, July 29, 1916.

Pontypridd.—An appeal by the carpenters and joiners of this district for an increase of wages of 2d. per hour was heard by the National Board of Conciliation for the Building Trades at its quarterly meeting. The operatives' case was stated by Mr. Williams, and was based upon similar grounds to those alleged in support of the Liverpool and London cases reported above. It was stated that there were no pre-war contracts and little work of any kind in hand, though much held up, and the argument was advanced that in view of present circumstances employers would not suffer in respect of existing commitments by giving an advance. For the employers Messrs. Julian and Jones stated the case, and objected to the demand on the ground that to grant it would kill what little trade now existed; they also feared the competition of neighbouring districts. The witnesses having retired, the Board considered the case and decided:—"That an advance of ½d. per hour be granted to the carpenters and joiners of Pontypridd as from May 1, 1916."

THE BUILDING TRADE.

SLAG AND ALLIED CEMENTS.

PREVIOUS articles under this heading have left undiscussed a special class of cements which, though unimportant as far as most building works are concerned, are of great value in special circumstances, and which, as far as the artificial class is in question, are likely to show development in the future. These are bodies known as pozzuolanas, which, while not actually cements themselves, have the power of developing hydraulic properties when mixed with lime. They can be conveniently discussed under the headings natural and artificial pozzuolanas, the former including the well-known material which formed the mortar of the buildings of ancient Rome, and which is still in use; the latter class being represented by cements made from blast-furnace slags. Both classes are very similar in composition, and consist of silica (SiO_2), alumina (Al_2O_3), with some iron oxide (Fe_2O_3), and a very variable proportion of lime (CaO).

Natural pozzuolanas owe their origin to what are termed by the geologist igneous rocks, *i.e.*, stones such as granite and basalt which have been in a molten condition at the time of their formation. The less important of these materials are represented by such products as arênes, a sand resulting from the decay of igneous stones, which has caused the decomposition of felspathic minerals, with the liberation and solution of alkalis, leaving a silicious and aluminous residue. Easily obtained, such materials are of local value; but the hydraulicity they are able to exhibit with lime is too small to admit of transit for wide application. The other members of this group which may be called natural pozzuolanas proper are of volcanic origin, *i.e.*, igneous stones which have cooled rapidly after ejectment from volcanoes, ancient or modern, or volcanic mud—dust from eruptions, which has been mixed with steam or water and converted into mud, subsequently hardened into rock by age and pressure of overlying materials. Of this volcanic mud trass may be taken as an example.

Sometimes quarried on the surface and sometimes mined at several hundred feet in depth, these materials vary considerably in the cost of production; but although mostly used locally, the export trade in these cements is not inappreciable. The process of manufacture consists of screening and then grinding the rock, which is sometimes also roasted, which operation improves its hydraulic properties. It is then mixed with dry slaked lime, when it is ready for use as a cement. Pozzuolanas are obtained not only from Italy, but from the Azores, the South of France, the Island of Santorin—which gives its name to the material thence obtained—and other places. The composition of these natural materials ranges approximately within the following limits:—Silica, 63 to 44 per cent.; alumina, 21 to 10 per cent.; iron oxide, 29 to 10 per cent.; lime, 18 to 2 per cent; magnesia, 5 per cent.; potash and soda, 11 to 4 per cent.; water, 9 to 3 per cent.

Artificial pozzuolanas include in addition to slag any argillaceous materials which can be burnt to yield products of a similar composition. Clay, for example, has been so used for large engineering works in situations where the cost of transit would have made the employment of Portland cement prohibitive, and very satisfactory results have been thus attained. Probably the classic example of such use is in the construction of the Asyût dam, where three parts of burnt ground-clay were used mixed with two parts of lime. The average tensile strength developed in inch briquettes of this cement is stated to be 272 lb. at one year, increasing to 320 lb. at two years, which compares favourably with many hydraulic limes in general use.

The most important cements here dealt with are, on account of the prospect of industrial development, those made from slag, which is produced in vast quantities in the manufacture of iron and steel, as an inevitable and very bulky waste product, for which very few uses have been so far found. Slags from metallurgical processes naturally differ very much in composition, but the basic slags formed in steel manufacture are silicates and aluminates of lime, and within certain limits of composition are suitable for cement manufacture.

Though not prepared to a large extent in this country, slag cements have a not inconsiderable sale in the United States, and there seems no reason why the British steel producers should not endeavour to foster this industry, which would be greatly to their advantage, by debating the possibility of producing slags possessing such regularity of composition as would render the cements obtained from them acceptable to engineers and architects.

Le Chatelier has stated that the compound in slag cements which confers hydraulicity is $3CaO\ Al_2O_3\ 2SiO_2$; and Eckel quotes the specification of an American firm, which states that the combined percentage of lime and alumina in the slag employed must not exceed 49, while that of the alumina alone must be between 13 and 16; the maximum of magnesia admitted is 4 per cent. This appears to admit of a very reasonable licence in composition.

As regards manufacture, though various processes have been tried, it is believed that all slag cements at the present time are prepared by allowing the molten slag to flow into a running stream of cold water, and the higher the temperature of the slag the better is the result. This sudden cooling granulates the slag, and also removes in solution a large quantity of the inevitable sulphur in the form of sulphide which these slags contain. This element is present chiefly as calcium (lime) sulphate and sulphide. The former in reasonable quantity is not objectionable, its action being merely to decrease the rate of setting; but the latter in the presence of moisture breaks up into slaked lime and sulphuretted hydrogen, and, since the former compound is formed with a great increase in bulk, it is a distinctly dangerous body to admit into any finished product. Cements which contain objectionable quantities of sulphides are said to give a fracture, having a greenish tint when briquettes are broken which have been kept under water, though no standard test based on this property appears to have been formulated. The granulated slag, which contains a very large proportion of entangled water, is dried and finely-ground, and then mixed with lime, the proportion of which to 100 parts of the slag varies from twenty-five to forty parts. Fat lime is generally used, and is as good as any other as far as the hydraulic possibilities of the slag are concerned; but, owing to the great shrinkage which fat lime undergoes on drying, a slightly hydraulic lime is preferable to obviate any risk of cracking of the cement mortar after use.

Slag cements are lighter in colour than Portland, and have a lower specific gravity, about 2·7 to 2·9. Though they never attain the strength of good Portland cement, the better brands are not much below this figure. It should be noted, however, that in compression—in which condition all cementing materials should really be judged—they are a good deal inferior to Portland. The ratio of tensile to compressive strength for Portland is about one to ten, but according to Eckel this ratio for slag cements is only about one to five.

BATHS, TREHARRIS.

The pit-head baths provided by the Ocean Coal Company, Ltd., for the workmen at the Deep Navigation Colliery, Treharris, were recently opened. The baths have accommodation for 700 men and boys. Mr. G. D. Jones prepared the plans and supervised the work. [We are always glad to hear of the provision of baths in connection with manufactories and works.—ED.]

PROPOSED NEW BUILDING AND OTHER WORKS.*

IN these lists care is taken to ensure th accuracy of the information given, but it ma occasionally happen that, owing to buildin owners taking the responsibility of commencin work before plans are finally approved by th local authorities, "proposed" works, at th time of publication, have been actually commenced. Abbreviations:—T.C. for Tow Council; U.D.C. for Urban District Council R.D.C. for Rural District Council; E.C. fo Education Committee; L.G.B. for Loca Government Board; B.G. for Board o Guardians; L.C.C. for London County Council B.C. for Borough Council; and P.C. for Paris Council.

Aberdeen.—At a recent meeting of the Plan Committee of the Aberdeen T.C. seven sets c plans at an estimated value of £13,700 were considered. Two of these were plans of dwelling houses, the remainder being plans of busines premises.

Bedford.—Plans approved by the T.C.:—Ope shed, Grammar School playing fields, fo Governors of the Harpur Trust; alterations Converter House, Queen's Engineering Works for Messrs. W. H. Allen, Son, & Co., Ltd. covered way, the Brewery, Lurke-street, fo Messrs. Newland & Nash; entrance to coffe bar, 33, Kempston-road, for Committee o Soldiers' Home; extension of offices and new car shed, St. Leonard's Saw Mills, for Messrs Astell Bros.; engine shed, Cauldwell-street, fo Mr. F. Ray; diversion of S.W. sewer, Queen' Engineering Works; alterations, 49 and 51 Hurst-grove, and new lavatories, Queen' Engineering Works.

Bolton.—The U.D.C. has decided to acquain the L.G.B. of the serious state of overcrowdin in the district, with the request that they woul allow the Council to proceed with the housin scheme at once.

Bournemouth.—The Buildings Committee ha approved the following plans:—Additions Cripples' Home, Burnaby-road, the Shaftesbur Society and Ragged School Union; additions "Charlton," Wimborne-road, Mr. J. Whireley conservatory, "Capri," Chessel-avenue, M G. H. Radley; alterations, Criterion Hotel, Ol Christchurch-road, Mr. C. H. Cartwright additions to basement premises, Christchurch road, Messrs. W. S. White & Co., Ltd. additions, "Woodstock," Priory-road, Dr. B. W Mankivell; alterations, 308, Holdenhurst-roa Home and Colonial Stores, Ltd.; motor hous Christchurch-road, Messrs. Butler & Co.; alterations, "Dalton," Hengist-road, Mrs. Pritchard

Braintree.—Plans for the erection of ten pai of cottages at Chapel-hill, by Mr. E. Valentin and a new power house, for the Crittall Manufacturing Company, have been passed by th U.D.C.

Cardiff.—Mr. Seager, a Bristol Channel shi owner, has given £2,500 for extensions to Cardi Hospital.

Clydebank.—Clydebank Dean of Guild Cou has passed plans for a new block of twent tenements for the accommodation of shipyar workers. The block will consist of 160 one-roo and kitchen and two-room and kitchen house and will be situated in Dumbarton-road, betwee the Public Library and the Caledonian Railwa bridge.

Denby.—The Denby and Cumberworth U.D. has approved plans for three dwelling-house being a conversion of farmhouse, etc., at Low Cumberworth, for Mr. Longley, and plans ar sections for alterations and additions and th substitution of a modern plant for sewa effluent treatment at the Lower Cumberwor sewage works.

Dorchester.—The T.C. has approved the following plans:—Mr. A. Hallett, for conversion No. 5, Westerhall, into maisonnettes; and th Wilton Estate, for redrainage of No. 7, Frederic place.

Dover.—Plans approved by the T.C.:—Mot garage, Messrs. Worsfold & Hayward, to be bui in Queen-street; plans from Lieut.-Command Spencer, Senior Officer of the R.N.A.S., of proposed Church Army hut to be built in Cast place.

Dundee.—The following plans and sections proposed new buildings, etc., in Dundee ha been lodged at the office of the City Engineer: Constitution-street, extension of works, f Messrs. W. G. Grant & Co., Ltd.; Inverar terrace, motor shed, for Mr. J. F. Munro.

Edinburgh.—At a recent sitting of Edinbur Dean of Guild Court plans were submitted the Incorporated Soldiers' and Sailors' He Society for converting premises at 18, Greensi lane and Marshall's-court into workshops f disabled soldiers and sailors.

---

* See also our list of Competitions, Contracts, et on page 462.

ipswell (Yorks).—Sir Hugh Bell and Lady
have promised to provide and equip at an
y date a large hut for the Y.M.C.A. at
swell, near Richmond, Yorks.
grow.—A scheme has been issued provision-
by the Charity Commissioners in respect of
um of £2,400 left by the late Mr. Hebden
ght, of Ingrow, for the foundation of a
mit Hole (Keighley) Hebden Wright Alms-
se Trust.
ettering.—The R.D.C. has passed plans for a
house at Corby, for Messrs. Lloyd's Iron-
e Company, and a motor shed at Messrs.
& J. Wallis's flour mills, Burton Latimer.
ongniddry.—It was reported at a recent meet-
in Edinburgh of the Ladies' Committee of
Scottish Veterans' Garden City Association
t it is hoped that a beginning will be made
the erection of the buildings at Longniddry
y next month, the estimates for which will
accepted at the next meeting of the Associa-
.
owestoft.—At a recent meeting of the T.C.
Sea Defence Committee reported the consent
he Board of Trade to the construction of the
ynes which the Surveyor had reported as
essary.
acclesfield.—An appeal is being issued to the
lic of Macclesfield and district for the funds
ded to carry out a contemplated extension of
premises at the Mill-street Mission
hyl.—It is proposed to erect a soldiers' hall
Kinmel Camp, Rhyl.
omford.—The D.C. has approved a plan for
erection of a factory in Mawney-road, for
H. N. Brook.
uislip-Northwood.—The U.D.C. has approved
ns for a garage at Field End Lodge, East-
e, submitted by Mr. W. J. Page, for Mr.
J. Hall.
eaham.—The Seaham Harbour U.D.C. has
proved plans for new club premises in North-
race, on behalf of the Seaham and District
rkmen's Club.
outh Shields.—A L.G.B. inquiry has been
d in regard to applications by the South
elds Corporation and the South Shields
).C. for sanction to prepare town-planning
emes.
troud.—The U.D.C. has approved a plan pre-
ted by Messrs. P. Ford & Son, on behalf of
. George Osborne, for alterations and addi-
ns to a dwelling-house at Tower-hill, Stroud.
wanage.—The U.D.C. has approved a plan for
litions to Rutland Cottage Victoria-avenue,
omitted by Mr. Date. and plans for two
tages at Newton, for Mr. Burt.
Vednesbury.—The T.C. has approved a plan
the erection of mess-rooms and canteen at
rks adjacent to Rose-street, King's-hill.
Vest Hartlepool.—The T.C. has approved the
owing plans:—Royal Electric Theatre Com-
ny, alterations to gallery and operating-box,
itby-street: South Durham Steel and Iron
mpany, Ltd., temporary workshop in works,
insforth-terrace.
Veston-super-Mare.—The U.D.C. has approved
ns and sections presented by the surveyor in
erence to the proposed provision of an addi-
nal storage tank on the west side of the exist-
low service reservoir at Montpelier.
Volverhampton.—The Electricity Committee
pose to make large extensions. Application
l be made to the L.G.B. shortly for per-
ssion to borrow £34,240.
Voolwich.—The licensing justices have passed
ns for alterations to the Powerful public-
se, Chapel-street, Woolwich (Mr. George
mm, licensee).
Vorksop.—Messrs. Thomas Turner & Sons,
ne and sand merchants, of Kiveton Park and
rksop, have decided to establish a large glass
tle works at Worksop. Plans have been pre-
red, and will be presented to the Worksop
D.C. at an early date.

GENERAL BUILDING NEWS.

CHURCH, CURRY RIVEL.

The dedication service in connection with the
toration of the north chapel of St. Andrew's,
rry Rivel, took place recently. The parish
urch of St. Andrew is a fifteenth-century
ilding situated at the north end of the village
een, and is conspicuous from the Langport
d Sedgmoor sides. Attached to its south
le is a thirteenth-century chapel, containing
its north side a series of recessed fourteenth-
ntury tombs. The chapel measures in-
nally 30 ft. 9 in. by 18 ft. 8 in., and is built
local blue lias with Ham stone facings. The
apel is divided from the chancel by an arcade
two arches. A feature of the chapel is the
nb arcade which runs the whole length of
north side. Until recently the chapel was in
very neglected state. The floor-level had
en raised by 10 in. to 12 in., and hid entirely
bases of some beautiful monuments. A
reful restoration has been carried out by Mr.
igh Bond, F.R.I.B.A., the Diocesan Archi-
ct, the work being undertaken by Messrs.
Pittard & Son, Langport, while the masonry
ork has been carried out by the sexton,
. E. Pitman. The total cost is about £500.

RATES OF WAGES IN THE BUILDING TRADE.

THE following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

—	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers' Labourers.
	d.	d.	d.	d.	d.	d.	d.	d.	d.	d.
Aberdare	9½	9½	9½	9½	9½	9	8	6½	6½	6½

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv.; Public Appointments, xvi.; Auction Sales, xviii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

Salary 7s. 6d. per day (seven days).

◆

TRADE NEWS.

The picture palace, Beverley, is being supp
with Shorland's special inlet ventilators
Messrs E. H. Shorland & Brother, Ltd.,
Failsworth, Manchester.

Under the direction of Mr. H. Fo
Licentiate R.I.B.A., Carlisle, Boyle's la
patent "air-pump" ventilators have
applied to the new Public Hall, Carlisle.

In the Smallpox Hospital at Ipswich
cavity walls were grouted with waterpro
cement, we are informed, and the
Medical Offices of Health at Ipswich
similarly built with Pudloed cement.

We have received from Messrs. S. W. Fra
& Co., Ltd., 64-70, Gray's Inn-road, W.C
neat little leaflet which they have just is
in place of their usual yearly catalogue.
contains illustrations and particulars,
veniently arranged, relating to rolling shu
of various types of which Messrs. Francis &
are the makers. They also manufacture
fronts in brass, gun or white metal; sp
roller sunblinds, collapsible steel gates,
fascias, gilt wood and metal letters, etc. Qu
tions will be submitted free of charge
requirements being communicated to the a
address.

[Those with an asterisk (*) are advertised in this issue.]

RICES CURRENT OF MATERIALS.

[Owing to the exceptional circumstances which evail at the present time, prices of materials ould be confirmed by inquiry.]

Timber prices and glass have been revised since last ue.—ED.

* Our aim in this list is to give, as far as possible, the erage prices of materials, not necessarily the highest lowest. Quality and quantity obviously affect prices a fact which should be remembered by those who ke use of this information.

LAW REPORT.

Official Referee's Court.

(Before Mr. Pollack.)

Spencer Santo v. H.M. Office of Works.

After ten and a half days' cross-examination by Sir Reginald Acland, the re-examination of Mr. Patten was postponed until after the vacation.

The witness was cross-examined as to the quality of the stone and the loss which the contractors alleged they had suffered from waste. He said that out of 113,000 ft. of stone, about 14,700 ft. was wasted owing to bad quality, in addition to the usual allowance customary in the trade, which was 15 per cent. He did not suggest that every stone cut out of the building or not allowed to be fixed had been charged for. Stones of inferior quality ought not to have been supplied. About 61,320 ft. of stone was left over when the work was finished, but it was not any of the good stone. It was taken to a yard in Battersea and was absolutely wasted. Some might still be there, but he could not say what became of it. It was sent there by the plaintiffs, but he had nothing to do with the removal. The great feature in obtaining stone was to secure good weather-resisting quality. According to the contract the builders were to be responsible for defective stone. The test for soundness was by tapping, but that was not an infallible test. A stone might be sound and true, but when it came to be worked a vent might appear, and a stone which developed a vent in working was the risk of the builder.

Sir R. Acland said that that disposed of the claim for bad stone supplied, because all the stones mentioned in the particulars had been worked.

Witness said that they did not have the opportunity of obtaining the proper stones, as they were not allowed to select them at Portland. They did not even see the stone until it arrived at the yard.

The re-examination was postponed.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3830. JUNE 30, 1916.

ARCHITECTS AND THE WAR.

SILENCE has been described as being golden and speech compared to a less valuable metal, but circumstances arise in which silver has an enhanced relative value. After the defeats on the Tugela in the South African War many journals told us "We must continue the struggle whatever the cost may be." Such statements are surely unnecessary, as no English Government could make peace because the struggle forced upon us proved more arduous and costly than had been anticipated. In like manner the Prime Minister's pledge that we should make no peace until Belgium had been compensated in full for the losses she had undergone was unnecessary to any who know the history and traditions of our race, and, though it is possibly well that such a statement should be made, because part of the electorate do not realise the facts and foreign Powers may have suspicions of our motives, most of us regret the necessity for such pronouncements.

Something like one-quarter of the whole number of architects in the country, comprising with very few exceptions all capable of active service, volunteered before any question of compulsion was mooted. But no profession or calling can in this respect be said to be pre-eminent, and England has found her sons as eager to serve their country as in any past age of her history.

We may say without danger of contradiction that the educated classes, excluding an insignificant number, have responded to the call of patriotism regardless of personal loss and hardship. If unanimity among the working classes has not been equally pronounced, it is due to want of a full realisation of conditions, not to want of patriotic instincts.

Architects, builders, and others connected with building have amply fulfilled their duty as citizens, but to express surprise or great gratification that they have done so would seem to be an insult to those we know and value; the wonder would have been had they behaved otherwise.

The men who have fallen have taken their place in the nation's roll of honour; while others who have distinguished themselves—and many have done so—have done honour not only to their calling, but to that great race to which all of us are proud to belong.

While we feel that notices in our pages of those who have rendered distinguished service or made the greatest sacrifice of all are a poor and inadequate acknowledgment, we shall welcome any note from friends with a view to recording their achievements in our pages, in which we shall gladly give any photographs which are sent to us.

Architects and others engaged in callings connected with building have been hit by the consequences of war to a greater degree than almost any class of the community. War has increased the immediate prosperity of many classes of the nation, it has made great demands of the profession of medicine, and produced unusual prosperity in the shipping trade. To architects it has in many cases meant temporary ruin and financial stress; nor have the Government adequately utilised the services of men whose knowledge would have enabled them to save millions on the nation's emergency building work.

Apart from the admirable work of the Professional Classes War Relief Council, the various architectural societies have organised work of their own which urgently required doing, and have by means of subscriptions and donations been able at one and the same time to help the victims of circumstances and to carry out work which required professional skill and knowledge of a high order which would not in ordinary times be available.

The Civic Survey and the Development Plan are instances of such work, and the example set in London is being followed in other large centres of population. It is not too much to say that through the action of those who are not able to bear arms, but have expended much time and effort in organising, work has been done which may be said to be essential for the right solution of the problems which we must deal with when peace returns. We intend in subsequent articles to give a specific account of the scope and character of the work which is being done.

Others again are giving work, time, and energy to the movement for improving the arts of design as applied to commercial uses. They are thus helping in building up the sinews of commerce, for it is in the design of the objects of common everyday use that we are deficient—a deficiency marked by the extent to which our markets have been successfully exploited by our trade rivals in the past.

Besides the Civic Arts Association, the various town-planning organisations and societies are doing much useful work, the result of which will be apparent when normal conditions are restored.

In every direction we investigate we find that architects who are at home, no less than those who are in our armed forces, are "doing their bit" and carrying out work of value and importance to the community.

We feel that a technical journal can do little, but if our readers can indicate how we can make the *Builder* of greater use to those who are serving their country at home and abroad we shall be glad to assist to the utmost of our power.

We whose field of activities covers the arts of peace cannot fittingly chronicle the deeds of war except in so far as they affect architecture and the arts. It may be felt by some to be a relief to find no war news in our columns, and, while war is happily a temporary and abnormal condition, the arts of peace are a necessity for mankind, and will be even more of a necessity in the future than at present.

We all know that "business as usual" is a misleading phrase when nothing can be as usual, but we have considered that a technical journal should chronicle as far as possible the attempt of those who remain by force of circumstances spectators and not actors in the great drama now being played to carry on their occupations and pursue their aims as usual.

We cannot name a date when war will give place to peace, but we know that date will come, and that the deeds wrought by our people will form an imperishable page in the records of our race, and will have secured for future generations an ideal to live up to and a charter of freedom for the suffering nationalities of Europe.

The men whose deeds will bring about this result are not among those who care for or need the laudations of the Press or are encouraged by the hysteria of easily-moved audiences, but those who would rather act than talk, and who are following in this in the footsteps of those who have built up our history in the past. Drake insisted on finishing his game of bowls when he was told the Armada was sighted, Wolfe would have preferred to have written Gray's "Elegy" than to have conquered Quebec, and we know our people to-day are what they were in the emergencies of our past history.

NOTES.

Dublin Town Planning Award.

We have a communication from the Royal Institute of Architects of Ireland with reference to the repeated delays which have taken place in connection with the competition for a Town-Planning Scheme for Dublin. Lord Aberdeen, as our readers will remember, gave £500 for this purpose, and the assessors selected were the City Architect and two American architects. The story is one of delays. The time of sending in was postponed till April, 1915, in consequence of the war, the competitors, after much delay, receiving a printed notice stating that May 1, 1915, was the closing date for receipt of designs. On June 10, in reply to a letter from the Hon. Secretary of the R.I.A.I., it was stated that two of the three assessors were not available and that the third would not act without his colleagues. The Hon. Secretary thereupon sent Lord Aberdeen a letter enclosing a resolution passed by the Council of the R.I.A.I. to the effect that Lord Aberdeen should appoint others who would adjudicate. The Council was informed that Mr. William A. McConnal, Assistant Hon. Secretary of the Civics Institute of Ireland, would assess, and the R.I.A.I. are now informed that the adjudicators commenced their work on Saturday, June 17. We trust the award will commend itself to all since the conduct of the matter would appear to have been deliberate rather than hurried.

Charing Cross Bridge.

Much space is given in the *Observer* to further letters protesting against the South-Eastern Railway Company's action, the protests including a letter from Mr. Lutyens. The most interesting contribution is an account of the interview accorded to a representative of the *Observer* by Sir Francis Dent. The company's motives have, we learn, been misunderstood, and they are anxious to effect improvements, a statement which is pleasing, if surprising in the face of what they have left undone in the past. We should gather from the letter that it would take something like fifty years to get the improvement carried out and that the company in the meantime are considering the convenience of the public with tender solicitude. We are told Vauxhall Bridge took eight years to build, but Sir Francis Dent knows perfectly well that the statistics of the past are no criterion in dealing with the problems of to-day. While he was about it he might as reasonably quote figures relating to Old London Bridge We can imagine, if the question of building a cathedral at Liverpoo were under discussion, someone urging that, though Liverpool needed a cathedral, as judging from past experience it would take between 300 and 500 years to complete one, and therefore the question might be adjourned *sine die*, since it had no bearing on practical politics. We undertake to say that there is no reason why the whole improvement should not be completed within four years after the termination of war if the problem is taken in hand at once, and that for the time being no one will be surprised at suffering inconveniences when travelling on the South-Eastern Railway Company's system. They always have suffered in the past, and might be disturbed if it were found that convenience was considered now!

The Value of a Name.

Mr. W. D. Caröe suggests in a letter to the *Times* that the bridge we all hope to see built at Charing Cross should be called "Kitchener Bridge." In the first place, we trust that the present struggle may be determined by a battle which may be as immortal and decisive as Waterloo and not by a gigantic period of attrition comparable in kind, though not in magnitude, with the final stages of the South African War. If a colossal battle in the West decides the fate of Europe the name given to it will transcend that of the most illustrious of leaders or of men and would be more fitting to commemorate all that the war stands for. But can we reasonably abandon the epithet Charing Cross, the only memory which connects London with the story of a great English king's devotion to his wife, and will the new bridge be less of a memorial to those who have fallen in the war if it is connected with one of the most picturesque incidents in our past history? We question whether Mr. Hind's suggestion of a memorial chapel in the centre of a busy thoroughfare is a wise one; but, if the idea finds favour, why should not a new and greater Charing Cross at one and the same time commemorate an incident in past history and the present war? A chapel would take up much space, a great memorial cross flanked by sculptured groups and memorials would take up comparatively little. If a memorial chapel is erected we hope that it may take the form of a structure at Westminster in close connection with and proximity to the Abbey.

A Monument.

By Mr. John Keppie.

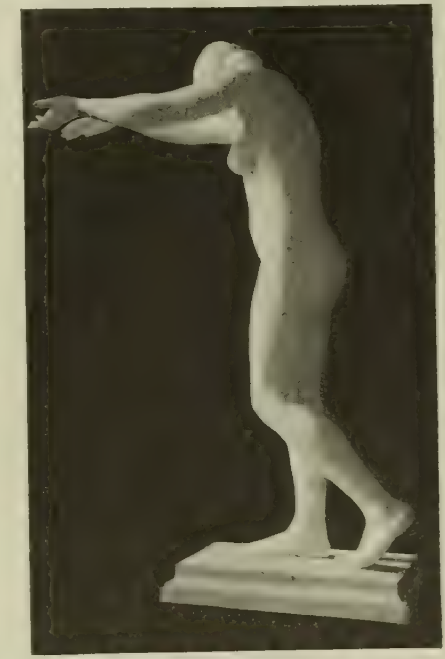
Scottish Royal Academy Exhibition. (*See pages* 468 *and* 474.)

SCULPTURE AT THE ROYAL SCOTTISH ACADEMY.

The Academy recently had an exhibition of foreign sculpture, and again it has a specialised collection, this time the works of Scottish sculptors of the late eighteenth and nineteenth centuries—lean years when the patronage accorded provincial men was meagre, so that even where their work remains the knowledge we have of the artists is slight. In the catalogue are over twenty short biographical notices, together with a well-written critique from the pen of Dr. Pittendrigh Macgillivray, to whom largely is due the credit of bringing together the present collection.

The representation of busts is fairly adequate, though its limitations are obvious and admitted, small pieces only being available when larger ones would more worthily have displayed the artists' power. This reason one can appreciate; but might not photographs have been had of groups and the like? Supplementary indeed, not only to this but to every exhibition of sculpture, that method of representation may be commended. Two or three well-chosen views may not inadequately prove a substitute for an actual statue as for a piece of architecture; even were the actuality transportable it would still be advantageous with it to have a view of its location, especially if it entered into the composition of a building. As a case in point, among the general exhibits are small-scale sketch groups—"Science and Agriculture" (93, 94), by Mr. Birnie Rhind—that, unless intended to be isolated and self-sufficient in themselves, would have their merits more judiciously appraised if accompanying them were illustrations of at least the part of the building they are to decorate—if for nothing else to guide in the placing of the model, whether purposed at or above eye level. In all exhibitions are some pieces that would be the better of this explanatory illustration.

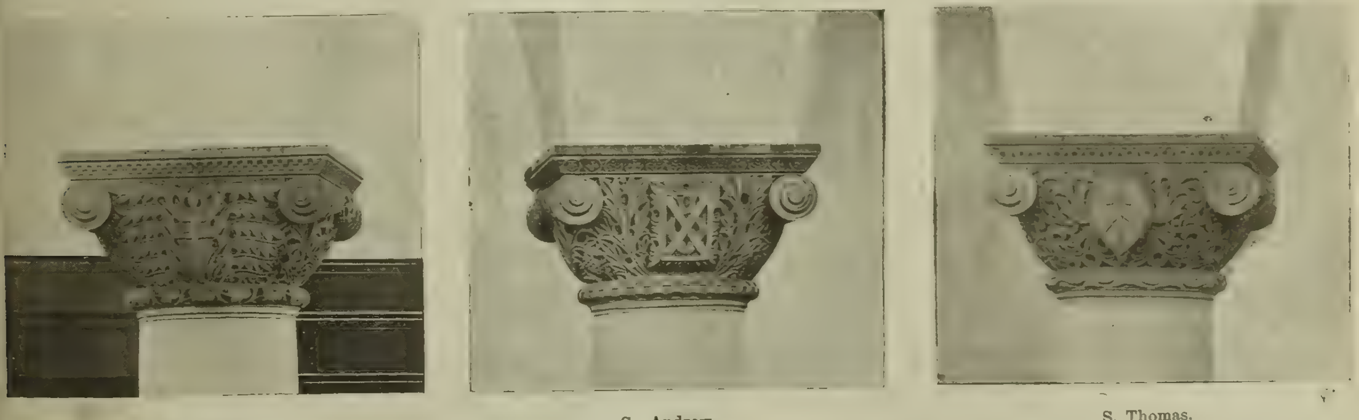
There are about forty marble busts, of Scottish worthies chiefly, many of them famous, and the ordinary visitor is divided between interest in the persons portrayed and the artistic worth of the sculpture. Viewed simply as models, some must have been a joy to the artist: such heads as Christopher North, Hugh Miller, Dr. Chalmers, and John Henning are inspirations. With strongly-marked features that might easily be exaggerated, one has a measure of assurance in their truthfulness, noting the exactitude of finish given, the treatment then admired in distinction to the sketchy suggestiveness nowadays preferred. A recent bust of Lord Kelvin (53), by Mr. A. McF. Shannan, and it no extreme of modernity, illustrates the difference in method. The hair in these older portraits, one suspects, is conventionalised; locks and beards were hardly so clustered and ropy, yet, after all, that arbitrary treatment is perhaps as successful and as true as the blocked-out manner general now. Hamlet, Portia, and Rosalind are imaginative essays; and besides these are over twenty miniature medallions of heads by the celebrated Tassie (1735-99) and others; these are modelled on the full half-round, and so avoid the difficulties of low relief. Larger pieces are "Grief" (46), in plaster, by Mr. Jas. Fillans, not very sensitively modelled; "Two Children with Hound" (34), in marble, by Mr. Patric Park, where the over-precise definition of the eyes hardly conveys the child character—both were artists of the early part of last century; "The Bard" (30), a terra-cotta group, rather too dispersed, by Mr. Geo. A. Lawson; "Echo" (74), a three-quarter size nude figure, by Mr. D. W. Stevenson, with fluttering scarf and graceful pose if idealised form, proper enough in the expression of a thought: "Hebe" (62), a severely classical study, by Mr. W. Calder Marshall; and the "Murmer of the Shore" (67), a semi-draped female in plaster, by Mr. Chas. McBride. Burns is a perennial exercise for Scottish sculptors—(75) and (80) are standing figures, by Mr. Wm. Mossman and Mr. John Rhind respectively. The former is the more sentimental, as a poet may be imagined to look like: the other discards the plaid and accessories that proclaims the ploughman, and elects to show him in the graceful dress of his period, but with pen and notebook, to denote the man of letters. An adjoining figure of a wearied "Thresher" (63), by Mr. Kellock Brown, if given the features preserved by contemporary portraits, might serve equally for Robert Burns. Best of all is a half-size marble figure of an "Athenian Youth" (95), by Mr. John Rhind, beautifully modelled and most carefully finished.



"1914."

Mr. Percy Portsmouth, A.R.S.A., R.B.S., Sculptor.

Of present-day artists' works (77), in dull bronze, a nude standing figure of a woman stunned and groping, with outstretched arms, one hand seeming to deprecate attack, the other inviting succour, is how the year 1914 is personified by Mr. Percy Portsmouth; "Eve" (82), a marble statuette, by Mr. Allan G. Wyon, may be compared with "Grief" (46)—the titles are interchangeable. This is the more muscular form, but treated with that purposed indefiniteness of finish that is a modern note, for in marble, as here, it is an intentional effect, something not incidental to plastic modelling, and in effect quite legitimate, but, like the slur in music, to be sparingly used. (No. 81) is a charming boy's head in marble, by Mr. David A. Francis; it may also be compared with the two children (34), and to the advantage of the modern; (73 and 71), by Miss Christine Gregory, small bronzes of a girl lying in unstudied attitude and a child, both admirable; (89 and 88), by Miss Florence A. Kendrick, are delightful—bronzes of a "Laughing Peasant" (a head) and "Puck." Of works of the late Associate, Mr. A. McF. Shannan, there are two examples, bronzes, besides that one noticed (72), the "Hunter and the Wood Nymph"—the two heads rather conglomerate; and (97) the "Music of the Marshes," taking its title from the frogs that attend a maiden nicely posed with a long bullrush that gives a fine line—both pleasing compositions. The biggest exhibit of all is in one of the picture-galleries, "Les Tigres" (96), by M. le Comte Jacques de Lalaing, honorary member, a tremendous thing in bronze, two animals, more than life-size, face each other over their prey: realistically modelled but withal composed so that there is a practical symmetry even with contrast. Dr. Macgillivray's contribution is modest (85), "Petrarcha," a portrait medallion from the only extant drawing; (86) the "Purple Iris," a female half-figure among the reeds; and (87) "Fantasy," rather incomprehensible, and why in bronze, perpetuating the few suggestive touches of a clay model?



S. Philip. S. Andrew. S. Thomas.

Capitals: Dalziel United Free Church, Motherwell. (*See page* 469.)

Mr. H. F. Kerr, A.R.I.B.A., Architect.

ILLUSTRATIONS.

Interior of St. Giles' Cathedral, Edinburgh.

THE picture is drawn from the Preston aisle, looking across the nave to St. Eloi's Chapel. In the foreground are the graceful fourteenth-century pillars, with their rich bases and capitals, and beyond the massive octagonal Norman piers (bearing the marks of fire and violence) support the dark masses of the heavy vaulting. Two stained-glass windows (by Cottier) to the left of St. Eloi's Chapel form the distant point of interest, whilst the sombre-coloured banners of the Highland regiments, suspended from the arches, add to the colour effect and romance of the picture.

STEWART CARMICHAEL.

West End of Bishop's Hostel, Lincoln.

OUR illustration shows a characteristic example of Mr. Temple Moore's work exhibited in the Scottish Academy Exhibition.

Ewelme Down, Near Wallingford.

THIS house is built of a rough grey stone from Marcham, with the dressings of Doulting stone. The walls are hollow and lined with brick, and the roof is composed of grey stone slates. The house is built on a very exposed spur of the Chiltern Hills overlooking Wallingford, and the doorstep is 700 ft. above sea-level. The views in all directions are magnificent.

The general contractors were Messrs. Simpson & Sons, Paddington-street, W. The metal casements were by Messrs. Geo. Wragge, Ltd., London and Manchester; and the consulting engineer was Mr. E. Wingfield Bowles, Victoria-street, S.W. The architect was Mr. Walter Cave, Sackville-street, London, W.

Our illustration is from a photograph kindly lent to us by *Country Life*.

The New Royal (Dick) Veterinary College, Edinburgh.

THE main buildings of this College are devoted to teaching and administration, and comprise separate departments for anatomy, chemistry, physiology, pathology, biology, materia medica, medicine, and obstetrics. They are entirely separate from the buildings forming the Clinical Department, and are so arranged on the ground as to allow of a large open courtyard in connection with the latter and a quadrangle to the former, which will be tastefully laid out with lawns, shrubbery, and flowers. The front is three stories in height, with the central part rising to four stories and forming the principal architectural feature in the elevation. The south wing is two stories high and the north wing three.

In connection with the various departments there are provided seventeen laboratories and five lecture theatres, with appropriate preparation-rooms adjoining, large dissecting-room to accommodate sixty-two students, hall for special functions seated for 300 persons, with ante-room, board-room, principals' room, and space for the Secretary's Department, and public waiting-room, etc., and professors' private rooms. Extensive laboratory accommodation has been provided for research into animal diseases, the aim of the authorities being that the institution should not only train students, but should also extend knowledge of the cause and prevention of disease. Excellent lavatory accommodation is provided throughout the buildings and abundance of storage; provision has also been made for laboratory and other extensions should such be required There is also a large general museum and several departmental museums.

In the Clinical Department, at rear of main buildings, and the front elevation of which forms the fourth side of the "quad," provision is designed for the treatment of all kinds of animals, there being accommodation for horses, cows, and a couple of sheep pens, five isolation and general wards for cats and dogs, with enclosed "runs" adjoining the latter, two operating theatres for large and small animals respectively, with dressing-room adjoining; post-mortem-room, stocks and X-ray apartment, and rooms for teaching pharmacy and giving surgical demonstrations. It is proposed that the stable and other fittings throughout the buildings shall be of the most hygienic patterns. There is a large special laboratory in connection with this department and accommodation for the smaller animals. A bath for horses has been provided, and provision is made for teaching practical shoeing; while there is the necessary food and bedding stores, etc., required for such an establishment. The professors have their private rooms, and there are waiting and consulting rooms adjoining. The electrical work was carried out by Messrs. Malcolm & Allan, Ltd.

D. McARTHY.

Easterton, Milngavie, Dumbartonshire.

THE work illustrated is from a western wing added a few years since to what was formerly a plain square house of classical type, but without much architectural interest either in plan or elevation.

The additional accommodation thus provided comprises a new drawing-room and smoking-room on the ground floor, with bedrooms on two floors over. The old morning-room was altered to form a hall, with a new porch and vestibule; the dining-room was remodelled internally and the kitchen premises extended.

At the same time the garden extending to the west of the new wing was rearranged, with a path opening, across a sunken lawn, axially in line with the semicircular bay window of the drawing-room, and a garden house and dovecote were erected at the diagonally opposite angle.

Externally the house is of a warm white freestone with grey roughcast and dark purple-blue slates. As regards the internal finish, the woodwork of the hall is painted white, that in the drawing-room is lightly stained to a cedar tone and waxed, the walls throughout being all in plain tones of white and dull stucco or fawn colour. The principal contractors were:—

Masons—Messrs. J. H. White & Sons, formerly Albert-road, Glasgow, now at St. Andrews.

Joiners (including finishings)—Messrs. A. & D. McMillan, Milngavie.

Painters—Messrs. John Orr & Sons, Wellington and Glasgow. ALEXANDER N. PATERSON.

Library, Carrickarden, Bearsden.

THIS was an existing apartment—an ordinary parlour—remodelled and fitted as a library. The bookcases, fireplace, panelling, parquet, etc., are executed in "Japanese" oak, which, while it may not be quite so fine as Austrian, has the merit of coming from the country of a friendly Ally. To adopt Austrian oak at present would have been tantamount to "trading with the enemy." The oak is finished in a cool-grey tone, slightly waxed. The mid-walls are treated with Burge's "leather paper," of a quiet neutral tone, divided into panels with bands of like material with dull gilt studs. The upholstered seats flanking fireplace are finished in leather specially treated, the inside of the hides being exposed, presenting a soft, silky surface of a warm brown tone. Below the seats the space is utilised for loose magazines, and, in lieu of an ordinary coal-box, behind one of the flaps a pull-out compartment for coal is provided, with special runners and ball-bearings for ease of handling.

The oak fitments, etc., were executed by Messrs. James Grant & Co., 128, Pitt-street, Glasgow, and the painter-work by Messrs. J. & W. Guthrie and Andrew Wells, Ltd., 237, Old George-street, Glasgow.

WM. HUNTER McNAB.

Dining-Room, Redlands, Bearsden.

THIS forms a wing, added to the side of an existing dwelling, embracing new entrance porch, cloak-room, and lavatory. The house standing on quickly sloping ground, advantage was taken of the fall to obtain a motor-house below; indeed the primary reason for the new wing was to secure motor accommodation, as indicated. The former dining-room became the new entrance hall, from which access is given to the new dining-room, which forms the subject of the illustration.

The builders were Messrs. Dewar & Elliot, Glasgow. The fireplace, of fine white selected Auchenheath stone, was carved by Mr. James Young, Glasgow.

The panelling, in this case of Austrian oak—contracted for, however, prior to the war—is left in its natural state, without stain or polish of any kind, and was also executed by Messrs. James Grant & Co., Glasgow. The floor is of Canadian oak, in plain 3-in. boards, polished over entire area.

The ornamental plaster-work is by Mr. Geo. P. Bankart, London. The plain plaster-work—ceiling and frieze—is finished off the float with pleasing effect. WM. HUNTER McNAB.

Hinton House.

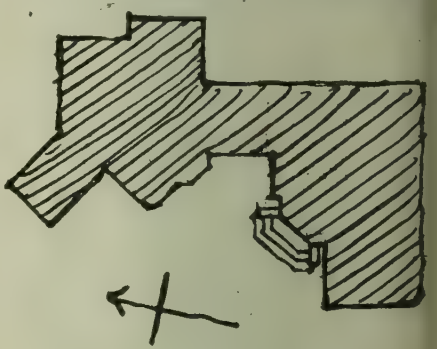
HINTON HOUSE, Northamptonshire, was built under unusually favourable conditions, the labour and materials of the structural work having been provided by a local builder and a commission paid to him on both. Several old stone-workers were found in the district, dressing stones in the old manner with a hatchet-hammer and not with the chisel. These men were turned on to the work, some old dressed stones were also used, and a quarry opened on the estate. The walling in colour is of the rich, deep tone of the well-known local material, the roofs are of red tiles, and all the windows have steel casements. The internal woodwork is mainly of oak. There is some beautiful timber on the estate, and all the old trees in the neighbourhood of the house were retained. The house itself lies well into the sun, near the edge of a large park in which are some great elms.

J. A. MORRIS.

Stobieside, Lanarkshire.

THE estate of Stobieside is in Avendale, Lanarkshire, and the site is on rising ground over 800 ft. above sea-level, with fine views of undulating pastoral country and heather-covered moor around, and the more distant hills beyond. Immediately to the south of the site is the old battlefield of Drumclog.

As shown by the accompanying key-plan, the plan of the house is somewhat irregular to meet the conditions of the site. As the illustrations indicate, the elevations are of the somewhat severe type of work typical to Scotland. The dressings of windows, doors, dormers, crow-steps, gables, etc., are of a grey-pink stone, the walls are finished with harl or roughcast, and the roofs covered with thick dark-blue slates. The interior generally is carried out in plain though typical detail, but in the hall and smoking-room the walls are lined with wood panelling, and the drawing-room has a circular vaulted roof rising from a high-panelled dado. LEADBETTER, FAIRLEY, & REID.



Stobieside: Block Plan of House.

Memorials in Stone and Marble.

THE two marble monuments are in the Cathedral at Glasgow, and were erected some years ago when I was in partnership with the late John Honeyman, R.S.A. They are in the transepts—one in each in the centre of the wall below the transept windows. They are in Carrara marble, the work being done entirely by local contractors.

In the crystal monument the bust is an old one incorporated in the new surroundings. The Sir James Watson bust was executed by Pittendrigh Macgillivray, R.S.A.

One of the stone monuments is at Denison and the other at Rutherglen Cemetery. They are constructed of stone from Craiksland Quarry, Ayrshire, and are also constructed by local contractors. I consider them excellent in craftsmanship. JOHN KEPPIE.

Dalziel United Free Church, Motherwell.

THIS church has been erected from funds bequeathed by Mr. James Clason-Harvie, of Brownlee, whose father was the first incumbent of the old church which is replaced by this arger one.

The site is recessed from Muir-street and is somewhat restricted from east to west; this suggested the square form of church, and the square form in its turn suggested a central dome, with galleries on three sides.

The dome is almost 40 ft. in diameter, supported upon eight stone columns each 20 ft. high and 2 ft. 4 in. diameter at the base. The caps of these columns are modelled on the upper tier capitals at Sta Sophia, and are richly carved, each cap symbolising one of the apostles: SS. Peter and Paul, on either hand as you enter from the west; adjoining these on either side of the dome S. Andrew to the north and S. Philip to the south; S. Thomas and S. James east of these respectively (see p. 467). The square forming the sanctuary is enclosed at the four angles by St. Matthew on the north-west, St. John on the south-west, and by wall corbels symbolising St. Mark and St. Luke, the four evangelists thus enclosing this space. The sanctuary is spanned by a plain barrel vault.

The dome is not set off in the usual manner on pendentives or arches or cornices above the main arcade; nor is there any drum. Indeed to avoid excessive height has been the chief object, so as not to prejudice the acoustics. The dome has therefore been kept low, and springs from the abaci of the columns. The consequence is that with a 40-ft. span and 20-ft. columns the dome is 40 ft. high from the floor.

To further secure perfect acoustical qualities the pulpit is kept within the limits of the dome, attached to the St. John column. The acoustics throughout are excellent.

The springing of the dome from the level of the capitals might be thought apt to give a feeling of lowness or depression. But there is instead of that a feeling of space and loftiness almost unexpected.

Nor do the galleries interfere with this effect, except rendering it difficult to get a photograph to give the true effect.

The pulpit is at the south side of the church, and in order that the sitters may all see well the rake of the south gallery is much steeper than that of the north or west galleries.

Also in order that the massive columns do not unduly impede the view the passages are placed not symmetrically but where sitters would not see; the consequence is that throughout the whole church only eighteen sitters are without a clear view of the pulpit.

Simplicity has been the keynote in the whole design, the only internal enrichment being the carved capitals, the oak work of the sanctuary, and the black iron electric fittings. The dome, arches, walls, and ceilings are all of white plaster finish.

The dome is not intended to be prominent on the exterior; a campanile 110 ft. high rising from the north-west angle gives character to a simple design and forms a conspicuous feature from a great distance.

The architect was Mr. Henry F. Kerr, A.R.I.B.A., of Edinburgh.

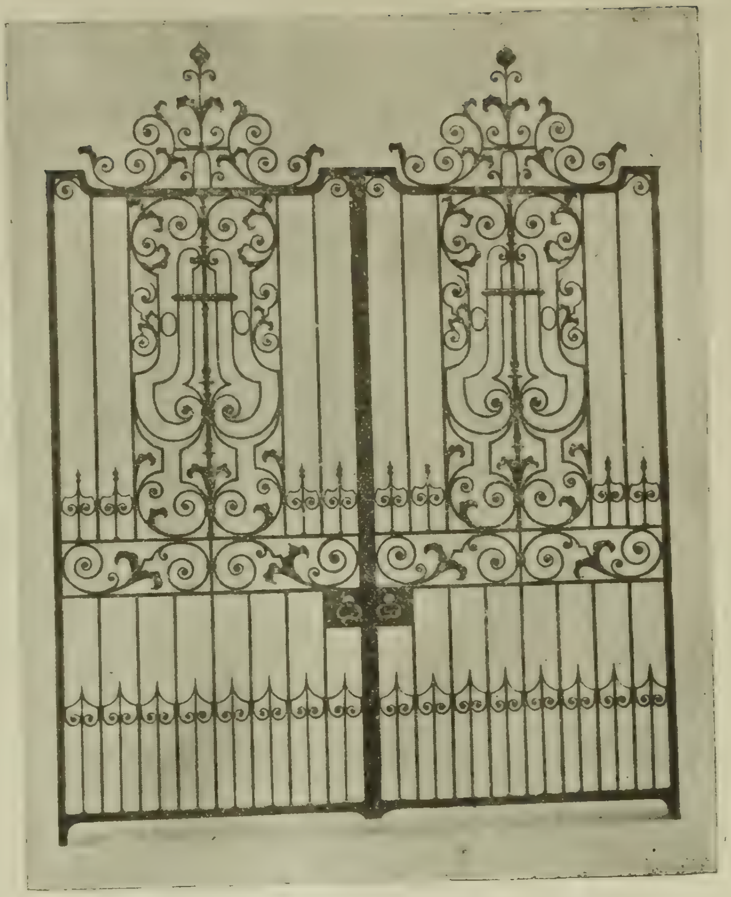
Deanbank Institution, Edinburgh.

THE purpose of this Institution is to provide the shelter and training of a happy Home for Girls.

For eighty years the Institution was conducted on premises in Deanbank-lane, Stockbridge. The School Board, in 1812, finding their school adjoining the Institution too small, purchased the building, and the Directors had to look out for a new site. They obtained a property with large garden in Cavan-lane, Morningside, the existing structure was removed, and the new building erected at a cost of £6,000.

It consists of two floors and a large attic floor, which can be utilised for extension should such be desired. The laundry and washhouse are situated in a separate building.

On the ground floor are committee-room, matron's sitting-room, waiting-room, officials' dining-room, girls' room, and play-room, divided by sliding partition—these two rooms together form a large hall for special functions—girls' dining-room, kitchen, scullery, lavatory, and girls' clothes changing-room, stores, pantries, etc., and lavatory and water-closets.

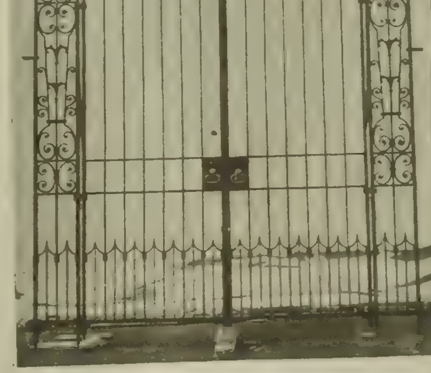


Wrought-iron Gates, Girvan (Ayrshire) Churchyard.

Mr. J. A. Morris. Architect.

On the upper floor there are four dormitories, containing forty beds, sick ward, three beds, matron and assistants' bedrooms, lavatory and bathroom accommodation, with water-closets, large stores, wardrobes, etc., and private bathroom and lavatory.

The grounds are tastefully laid out, the old fruit-trees being retained, and a large play-court is provided for the girls. They are educated in the Board schools. D. MCARTHY.



Gates, Girvan Churchyard.

Mr. J. A. Morris, Architect.

Wrought-Iron Gates, Girvan Churchyard.

THIS is one of the oldest churchyards in the county, and in it during the work was found an early Celtic cross. The church has long been destroyed, and the churchyard and enclosure walls were in shameful disrepair. In very reverent spirit the late Mr. Alexander Johnstone—whose forbears are there buried—received permission to remove the walls, which were of no archæological value, to make seemly the ground and to enclose the churchyard with hewn red sandstone walls and two large entrance-gates. In the larger of the gateways and its forecourt are placed the two gates illustrated; that with the circled head rises by the side of the two stone pillars, the other is the gate of the central stone archway. The gates were made by Messrs. George Wragge, Ltd., Salford, Manchester. J. A. MORRIS.

OBITUARY.

Mr. T. Lumsden.

The death took place at his residence, Danesfield, Jarrow, recently of Mr. Thomas Lumsden, a well-known builder and contractor in the North of England. Mr. Lumsden, who was seventy-five years of age, was born at Lowick, Northumberland. In 1868 he commenced business as a contractor in Jarrow. Amongst many building contracts which Mr. Lumsden carried out were the new Royal Infirmary, Newcastle, the Co-operative Wholesale Society's works at Pelaw, the new wing of Armstrong College, the Heath wing of the Medical College, Newcastle, and the agricultural wing of the Armstrong College. He also built several churches and was entrusted with the erection of a number of secondary and elementary schools. Several mansions in Yorkshire were erected by him, and a recent contract which he entered into was for Ampleforth College, Yorkshire.

GENERAL NEWS.

Professional Announcement.

Mr. Arthur H. Church, Licentiate R.I.B.A., has removed from 12, South-place, Finsbury, E.C., and his address is now 16 and 17, Devonshire-square, Bishopsgate, E.C. Telephone number, London Wall 9588.

The Late Mr. J. A. Martin's Estate.

The late Mr. John Ash Martin, of West Chapel-street, W., builder, has left estate to the gross value of £40,938.

An Adam House for Sale.

The town house of the late Sir James Goodhart, No. 25, Portland-place, is for sale by Messrs. Knight, Frank, & Rutley. It was built by the Brothers Adam for Robert Adam's occupation, and the original decorations have been preserved.

The Late Mr. C. Cox's Estate.

The late Mr. Charles Cox, of Eastbourne, and formerly of Hackney and Stamford Hill, builder and contractor, who died in May last, aged eighty years, has left estate to the gross value of £117,611, including personalty to the net value of £115,522. His many bequests comprise £1,000 each to the Builders' Benevolent Institution and the Timber Trades Benevolent Society.

The Proposed Mid-Scotland Canal.

Lord Provost Sir Thomas Dunlop presided at the last meeting of Glasgow Town Council. Before the ordinary business was entered upon a deputation was received from the Convention of Royal Burghs asking the support of Glasgow Corporation on the subject of a ship canal to connect the Firths of Forth and Clyde. The Lord Provost assured the deputation that the subject placed before them by the deputation would receive careful consideration, and it was agreed to put the matter on the agenda for the next meeting.

New President of the Architectural Association.

The new President of the Architectural Association is Mr. A. G. R. Mackenzie, F.R.I.B.A. Articled to his father, Mr. A. Marshall Mackenzie, A.R.S.A., in Aberdeen, he afterwards studied at the Architectural Association while in the office of Colonel Edis. He commenced practice as partner with his father, in London, in 1904. At the commencement of the war Mr. Mackenzie joined the London Scottish as a private and served in France and Belgium. Severely wounded at Messine, in October, 1914, Mr. Mackenzie spent a year in hospital, we understand, having lost his right leg. "He recently returned to work in London, and now walks five miles a day with an artificial leg, made by a Frenchman, of aluminium, which also enables him to climb ladders and drive his motor."

Educational Books for British Prisoners of War.

Arrangements have been made, with the approval of the Foreign Office, for extending to British prisoners of war interned abroad the benefits of the scheme, which has been in operation for the last year in connection with Ruhleben, for supplying selected books of an educational character to those of the interned who may be desirous of continuing their studies in any subject. Under this scheme several thousands of carefully-selected volumes, mostly standard works, have been supplied to the Ruhleben camp, which is now provided with excellent libraries (class, reference, and lending). These books, which have been sent out through the agency of officers of the Board of Education, have proved a great boon to the interned, and have enabled sustained educational work of a definite character to be carried on by the Camp Education Department formed among the prisoners. An appeal is now made for a plentiful supply of new or second-hand books of an educational character (light literature and fiction is available from other sources) to meet the needs of the many thousands of British prisoners interned in enemy or neutral countries. A circular explanatory of the educational book scheme can be obtained by sending a postcard addressed to the Board of Education, Whitehall, S.W., to Mr. A. T. Davies, who is in charge of the arrangements.

Roman Catholic Church, Lartington.

The new St. Lawrence's Roman Catholic Church at Lartington, near Barnard Castle, has recently been opened. The building has been erected at a cost of nearly £3,000. The church was designed and built by Mr. Anthony Lyons, of Norton (Malton). It consists of a sanctuary with a baptistry at the back, from which a spiral staircase ascends to the choir gallery. The presbytery adjoins the main building, which is constructed with stone from Cotherstone Quarry.

The Veterans' Club Association.

The Lord Mayor (Sir C. C. Wakefield) presided at the Mansion House on the 22nd inst. over a meeting held in support of the appeal to establish and endow the Veterans' Club as an Imperial memorial to those who have fought in the war. The following motion was unanimously carried:—"That an Imperial memorial to those who have fought so bravely for the Empire be created by establishing and endowing the Veterans' Club on a permanent basis in new and adequate premises for the use, comfort, recreation, and assistance of those surviving on their return to civil life, and by establishing and endowing convalescent homes in connection with the Club for the use of members who suffer from wounds or sickness."

The Lions of Stratford-Place.

Richard Cosway's house at the western corner of Oxford-street and Stratford-place is being demolished to make way for modern business premises, and that part of London loses one of the last of its eighteenth-century features. Each house at the corner of Stratford-place was flanked by a watchman's box, with a tablet on the Oxford-street side of each box bearing a device of two eagle-headed and winged lions sejant rampant, and on the roof of each a lion couchant in stone. The watch-box at the eastern corner was preserved when the premises were rebuilt for the London County and Westminster Bank, and the other is apparently to remain, for the lion on the roof has been boxed in to preserve it from injury.—*Times.*

National Association of Master House-Painters and Decorators.

At the quarterly council meeting of the National Association of Master House-Painters and Decorators of England and Wales (Incorporated), held at Painters' Hall, Little Trinity-lane, E.C., on June 6, Mr. Foster submitted the recommendation of an informal meeting of members at the L.C.C. School of Building, that a small committee be appointed to consider the question of the admittance of students of the school to the apprentices' competitions, and moved that such a committee be appointed. Mr. Brook Jackson seconded, and this was carried. The following gentlemen were appointed:—Messrs. Harris (Plymouth), Bar (Leicester), Milligan (Halifax), Foster (Burnley), Cantrill (Manchester), Peters (Sheffield), Roberson and Wilkinson (London), and the Secretary.

Glasgow Housing Problem.

Mr. McKinnon Wood, M.P., received at Glasgow recently a deputation representing the trade unions, co-operative guilds, and similar organisations included in the Glasgow Labour Party Housing Association. The delegates dealt with the serious shortage of housing accommodation, and asked the Scottish Secretary to lay before the Government the urgent necessity for the State providing, interest free, ground for house building. The Scottish Secretary, in reply, said the proposal would require careful consideration, as it implied practically one million sterling for Glasgow alone the first year, and if they took the United Kingdom on the same basis of population that represented fifty millions sterling. There were three difficulties in the way of dealing with such a question during the war—first, the enormous artificially increased cost of building material; second, the great scarcity of labour; and third, the very high rate of interest that the State had now to pay. Glasgow housing conditions were extremely unsatisfactory, and something would have to be done to deal with the conditions that were prejudicial to health and damaging to the moral standard of the community, but he was afraid they must wait till after the war.

PROFESSIONAL CLASSES WAR RELIEF COUNCIL.

An admirable record of work done was shown in the first annual Report of the Professional Classes War Relief Council presented at a meeting held at the Mansion House on June 20. It will be remembered that the Council was formed shortly after the outbreak of war in order to deal with distress within the professional classes, and representatives of the chief professional bodies associated themselves with the movement. At the present time amongst those serving on the Council are Mr. E. Newton (President, Royal Institute of British Architects), Mr. George Hubbard, F.R.I.B.A., Mr. Ian MacAlister (Secretary, Royal Institute of British Architects), Mr. T. E. Bare (President, Quantity Surveyors' Association), Mr. H. Chatfeild Clarke (Surveyors' Institution), Mr. A. S. E. Ackermann (Society of Engineers), Mr. H. M. Fletcher (Hon. Secretary, Architectural Association), Mr. Percy B. Tubbs (Society of Architects), Mr. Paul Waterhouse (Architects' War Committee), Mr. F. R. Yerbury (Secretary, Architectural Association), Mr. A. T. Wakelam (President, Institution of Municipal and County Engineers).

The work of the Council is carried out by a number of committees, but the general statistics showed that the percentage of architects applying for relief was 3·75 per cent. of the total applications. The range of work undertaken by the committees includes the education of children of distressed professional men, the training of adult daughters, assistance to enable male students to continue their studies, maternity aid, the finding of temporary employment, etc. One of the committees, of which Mr. Colton, A.R.A., is the Chairman, and on which Sir Aston Webb, Messrs. E. Newton, P. Waterhouse, and Chatfeild Clarke serve, developes schemes for the employment of artists and deals with cases of distress. During the year several exhibitions of pictures, arts, crafts, etc., were held, and there is evidence that artists obtained a considerable amount of employment through this means. In July a permanent arts department was opened, which has developed considerably, and now provides a link between the public who have commissions to give in art work which they are willing should be carried out by those in difficulties owing to the war, and the artists themselves.

The Lord Mayor said there could be no doubt that no class had been so affected by the war as the professional classes. The working classes had never been so prosperous, as the war had brought them greatly increased wages and continuous work, whilst the professional classes had not only lost their clients, but had the pre-war millstone of commitments in the shape of rents and taxes, school fees, and so on from which they could not extricate themselves without assistance. He therefore earnestly pleaded for increased help to enable the Council to deal with the many cases which came before it.

His Eminence Cardinal Bourne proposed:—"That this meeting is of opinion that the work of the Professional Classes War Relief Council has been proved to meet a definite need at the present time and is deserving of continued and increased public support."

Mr. Marshall Hall, K.C., M.P., seconded the resolution, and said he thought the professional classes were going to suffer more in the future than in the immediate past, and it behoved them all to do what they could to meet such an emergency.

Mrs. Scharlieb, M.D., having described the work of the Maternity Home, Sir John McClure spoke on the educational work of the Council, and said that 450 children had been helped, and grants had been made for 160 children at boarding-schools. He remarked that now they were all so busily engaged in giving up the luxuries of their neighbours they might try and assist their friends.

The resolution was carried.

The Right Hon. Lord Justice Phillimore, in proposing a vote of thanks to the Lord Mayor, said that one class greatly affected were those engaged in works of construction. Especially were architects and the humbler members of the architectural profession affected

CORRESPONDENCE.

Charing Cross Bridge.

SIR,—Would you be good enough to tell me through your columns why the name of C. E. Mallows is never mentioned in all the tempest on paper over the Charing Cross Bridge? Are the combatants so ignorant that they do not know that Mallows devoted far too much of his time and energy to this matter? Or are they too mean to acknowledge that they are trading on what he, in and out of season and place, advocated, and no one paid the slightest attention to him? JOSEPH PENNELL.

The Late R. A. Briggs.

SIR,—My attention having been drawn to an error in your obituary notice of my brother, R. A. Briggs, I trust I may correct it, especially in view of the fact that from my personal knowledge the officials of Worcester Cathedral frequently inform visitors, wrongly, as to the source of the designs for the Jesus Chapel there. In your notice you state my brother made the designs for Jesus College Chapel, Cambridge. This should read Jesus Chapel, Worcester Cathedral. *En passant* one may express the regret that the colouring of the work (executed by Messrs. Martyn, of Cheltenham) has not, so far as I know, been completed as my brother intended. ALBERT E. BRIGGS.

Diseases of Occupation among Painters and Plumbers : Board of Trade Figures—and Others.

SIR,—One is pleased to observe that after months of controversy your correspondent who writes over the name of "Philadelphian" has appreciated the fact that there is no compulsion to report cases of non-fatal lead sickness among house painters, and that, therefore, as the recent Report of the Departmental Committee on the use of Lead Paints states, "there are no reliable statistics" of such cases.

No one is likely to regard "Philadelphian's" own attempt at working out the number of cases as anything but a sheer guess; on the other hand, he puts forward two statements of fact which are curiously misleading and are worth contradicting:—

1. "The average age at death due to all causes in the painting industry is no less than eight years younger than all males." This statement is apparently based on the report of the evidence of Dr. Collis (page 46 of the Departmental Committee's Report). Dr. Collis states that in the case of two trade societies "the median age at death which Bowley in his book, 'Elements of Statistics,' regards as the most useful form of average . . . is eight years lower than it is for all males," and says that "these conclusions agree almost exactly with the corresponding deduction from the Registrar-General's figures." In the first place it should be made clear that this deduction is not a statement of the Registrar-General's: it is merely a calculation made by Dr. Collis. In the second place, Mr. Bowley nowhere in his book says that the median age at death is the most useful form of average. No one who was not ignorant of the most elementary principles of vital statistics could use such an average without regard to the age distribution of the sections of the community which are compared. The following instance will demonstrate this fallacy. The population of almshouses would yield a high "median age at death" because they are usually composed of old people, while the undergraduate population at Oxford would yield a low "median age at death." It is obvious that a comparison between the two populations (ignoring age distribution) would lead to the ridiculous inference that the incidence of mortality among the undergraduates of Oxford is much higher than in almshouses. This presumably is the sort of thing that is meant when people say that statistics can prove anything. They can be made to appear to prove anything, however ridiculous, unless all the necessary factors are taken into consideration.

The second statement is that "in every 100 deaths which have occurred among members of painters' societies between thirteen and fourteen occurred from causes attributable to lead." This is again based upon the evidence of Dr. Collis, who makes this statement in regard to the members of two trade societies. When these Reports are looked at it is found that they merely give a report of deaths with the age at death. There is no adequate record of the *numbers* exposed to the risk of death at each age or at any group of ages; and in default of this no accurate comparison of death rates is possible.

The fact is that these statements are among the most glaring instances of the notoriously amateur statistics which were presented to the Committee.

If "Philadelphian" will look at the figures of the Registrar-General he will find a much more accurate view of the rates of death among house painters on page 182 of the 1908 Supplement:—

	Comparative Mortality Figures.
(1) All occupied males, industrial districts	1,122
(2) All occupied males, London ..	1,099
(3) Group 64—painters, plumbers, glaziers	1,041
(4) All occupied males, England and Wales	925

Thus it may be seen that the mortality of Class 3 (of which the vast majority are house painters) compares well with the mortality of all occupied males in the industrial districts, and even with that of all occupied males in London, although that group contains large numbers of professional men not subject to the most ordinary trade risk. Indeed the comparative mortality of painters is only very slightly more than that of all occupied males in England and Wales.

From the Registrar-General's returns "Philadelphian" may also find that at all ages between fifteen and fifty-four the mortality among painters is lower than that among all other industrial occupations.

The subject is of sufficient importance to be worthy of more careful treatment than the slipshod estimates quoted by "Philadelphian." I would call the attention of your readers to the good sense of the remarks of your "Notes" for June 9:—"We know . . . that if reasonable precautions are taken and cleanliness insisted on there is little danger to health. . . . Most of the danger arises from the dry rubbing down of old painted work, which can be dispensed with or only permitted if the painter wears a respirator; the remaining dangers are obviated by ordinary care and cleanliness, which are within the control of the individual." ENGLISHMAN.

BOOKS.

British Standard Specification for Wall Plugs and Sockets. Issued by the Engineering Standards Committee. (London: Crosby Lockwood & Son. Price 5s. net.)

THIS is the seventy-third Report issued by the Engineering Standards Committee, and it contains a standard specification for wall plugs and sockets—five ampere two-pin without earthing connection.

The description covers domestic wall plugs and sockets for pressures not exceeding 250 volts, and particular attention has been devoted to the fact that interchangeability is of the greatest importance. In consultation with the manufacturers the dimensions necessary to obtain this interchangeability have been agreed upon, the actual design of the plug being interfered with as little as possible. It is of interest to note that the standard plug is required to have side-entry for the flexible wire and a suitable shield. The Report is divided up into different sections devoted to the Plug portion, Socket portion, General and Appendix, and there is one plate illustrating dimensions of gauges. This specification is a very useful addition to the excellent publications of the Committee, and should be acquired by all those interested in electrical accessories.

Third Appendix to the Sixth Edition of Dana's System of Mineralogy. By WILLIAM E. FORD. (London: Chapman & Hall, Ltd. Price 6s. 6d. net.)

THE "Sixth Edition of the System of Mineralogy" was published in 1892, and the book now published is the third Appendix, covering, as far as possible, the period between January 1, 1909, and January 1, 1915—six years in all. The author divides the new names into three classes:—(1) Of varieties; (2) of doubtful species; (3) of established species; and three kinds of type are employed in the classified list to distinguish these classes. The most important development in mineralogical investigation during the period covered by the present volume has been the use of the X-ray as a means of studying the molecular structure of crystals. There is every possibility of great results being obtained by this method of investigation when it has been more fully developed.

The book is well arranged and must have entailed considerable work on the part of the author, but the circulation will be strictly limited to those who make a serious study of mineralogy, as there is no text of general interest.

Analytic Geometry. By H. B. PHILLIPS, Ph.D. (London: Chapman & Hall, Ltd. Price 6s. 6d. net.)

THIS is a very useful book, prepared to equip the student for work in calculus and engineering without burdening him with a mass of detail useful only to the student of mathematics for its own sake. There is no doubt that the differential calculus should be given to the student as soon as possible, and any book which tends to simplify matters is very welcome. The author has wisely commenced at the very beginning of the subject, and explanations are given of the algebraic principles and processes which are used so much in analytic geometry. This is followed by notes and examples dealing with rectangular co-ordinate, straight-line and circle, second degree equations, graphs and empirical equations, and other allied subjects, and in every case the text is simply expressed, and the average reader should have no difficulty in following the reasoning. Several clearly-drawn diagrams are given throughout, and answers are provided to all the exercises at the end of the volume, thus making the book very suitable for home study.

MR. T. K. GREEN.

The death, on June 23, is announced of Mr. Theodore Knolles Green, of No. 70, Finsbury-pavement, E.C., and No. 2, Ellerdale-road, Hampstead, N.W. Mr. Green was elected an Associate of the Royal Institute of British Architects in 1861, and he was the architect of St. Barnabas Church, Islington.

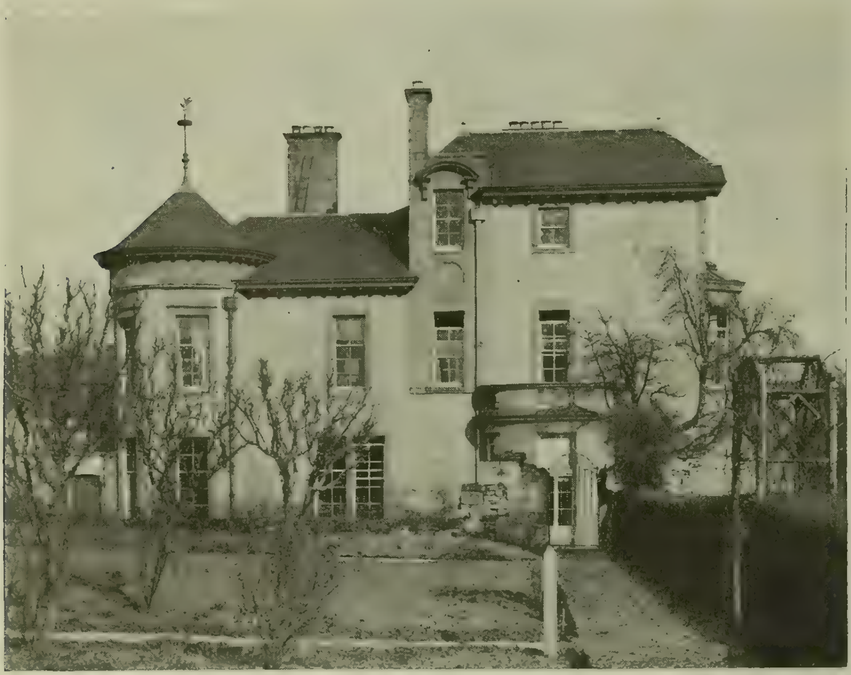
ARCHITECTURE AT THE ROYAL SCOTTISH ACADEMY



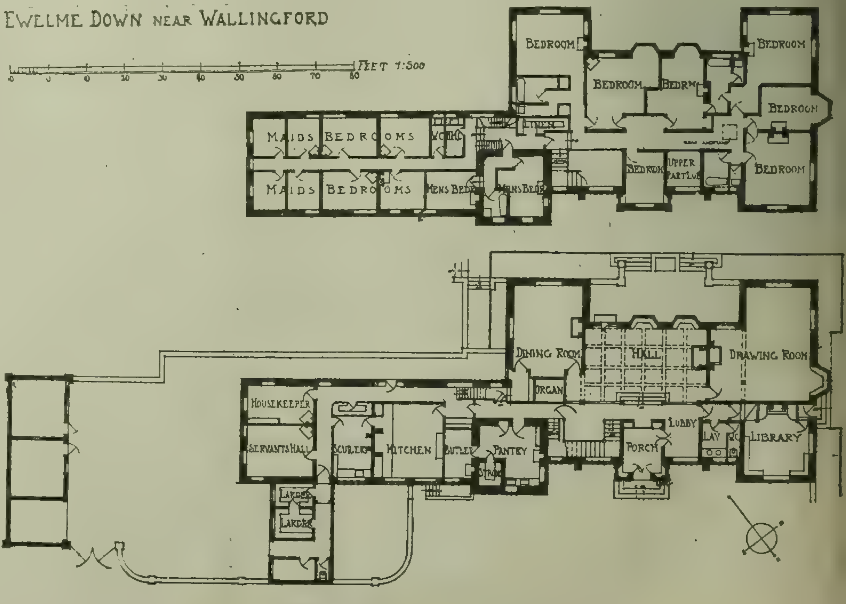
Easterton, Milngavie.

Mr. Alexander N. Paterson, Architect.

A GLANCE is sufficient to show the exceptional nature of the times; the preponderance of photographs tells of completed, not prospective, work; there is not a solitary competition drawing on view, perspective or otherwise; that any building at all is contemplated one gathers from three or four instances only. The two largest exhibits are geometric drawings with businesslike constructional details, and there are several others of the kind—a welcome variant, long urged in these columns, on the merely pictorial delineation that obtained, but just because so good an innovation one to be carefully guarded against anything likely to prejudice its success; a caution is needed as to excessive display of building technique. An ideal illustration of a building would be photographs—or prepared views of projects—with a sufficiency of plan, section, and detail to show how the effect was had; this is reached in Khartoum Cathedral (No. 559), published recently—over-reached indeed, for it is excess when a quite simple plan 170 ft. long is shown to ¼-in. scale. Elevations and sections to that size are tolerable, but barely when the harsh colours of materials, in section, necessary for practical purposes, fairly kill the parts that one actually sees in a building; is it expecting too much that an exhibitor should prepare fresh tracings of such working drawings, with the real interior of apartments, emphasised by shadings, roofs, foundations, and the like, being kept unobtrusive and only a sufficient plan? The other big stretcher has a tower and gable to even a larger scale (½ in.)—Gourock Municipal Buildings (No. 525), by Mr. A. N. Paterson, one of the few projected buildings. Specially prepared, but not an actual working drawing, it avoids these objections, has sufficiency of technical details, besides small plan and elevations of the whole scheme, and, excellently coloured by the architect himself, has enough of pictorial effect. The tower is well detailed, and as a feature is appropriate to its locality and position; the style is the more defined Classic that succeeded seventeenth-century Scottish Renaissance. The Council chamber promises to be a fine apartment.

Sir John Burnet's Institute of Chemistry (No. 564) has ½-in. working drawing prints of the elevation and section and a plan to smaller scale, supplemented by a pen-and-ink perspective and a photograph that permits of instructive comparison. The detail of door and the little interior stair is charming, but the general effect is disappointing; the brickwork is more than a trifle bald; the arch voissoirs might well have been emphasised as the sketch suggests. Sir John maintains the northern practice of recessed windows—9-in. reveals here—
preference to the flush frames painted whi
the obsession of English architects; but ev
their welcome depth does not make up
want of design. Of the new Sacristy
Brussels Cathedral (Nos. 535, .536, 5
Mr. Caluwaers gives scale drawings of t
general elevation and larger details of do
and one bay, all most elaborately shaded
pen and ink, with photographs of the co
pleted work. Working ½-in. scale drawin
of a staircase, with photographs (No. 54
Ardenrun Place, Surrey, by Mr. Erne
Newton; the finishing is in wood wi
an Order, and panels of tapestry, but t
feature is the raking stair parapet of pierc
carved scrollwork and children's figures-
the carver's name might have been adde
Supplementing the photograph of a ni
foliage-clad house, Ewelme Down (No. 561
by Mr. Walter Cave, is a mounted line
working drawing; that it shows signs
use is not to be complained of, but it
to be hoped the thrifty practice will n
increase.

Ecclesiastical work, if not dominant, abo
equals in importance any other class
building represented. The principal proje
is Sir J. Burnet's Second Church of Chri
Scientist (No. 526), shown in a full set
$\frac{1}{16}$-in. geometric drawings and a lar
perspective. The church is square, dom
covered, with four shallow recesses formi
a Greek cross; these are barrel-roofe
three contain galleries; the fourth forms t
chancel and has a screen of columns, a
where the rood beam usually is, in
four arches it appears, and from them ha
lamps. The area floor has a considerab
fall to the platform, and the side and corn
entrances are cleverly arranged. The sty
is Byzantine, and there is a square tow
with a circled story and conical spire.
seems a pity that externally the dome as
feature of the composition does not appea
lost by a needless solid parapet that mak
a high square against which the four arr
of the cross abut; these in turn have the
height gratuitously added to by circl
pediments—from the sides seen to
gratuitous—surely too big and rather aw
from the style. A nice feature is t



Mr. Walter Cave, Architect.

caded cloister-walk, but again too big in ale, and its termination as shown to be esumed as only a temporary arrangement. e clever coloured sketch would be even tter with the exaggerated dabs of blue d emerald green omitted. This about cludes the geometric delineations of ildings.

Mr. Gilbert Scott's two churches, St. ul's, Liverpool (No. 566), and Northfleet o. 567) are shown by photographs; tle key plans would have helped; both e fresh and suggestive of the newer Gothic. he latter, almost wholly of brick, has a noble est tower; its entrance front is especially e, if from the rear a little unshapely and o much a back view; the level clerestory d flat square-panelled ceiling hardly please well. St. Paul's, with three lateral bles, hipped at their apex—to mark off om the chancel?—and rather formless ntral tower has, on the other hand, its st within—a vaulted interior. St. Bride's, yndland, Glasgow (No. 573), is one of odley's churches, modified and completed Mr. Harold Ogle Tarbolton; a key plan ere is certainly desirable, not only to show e general disposition, but which is the new art. The photographs are of the interior ly, so Mr. Tarbolton's fine tower is not own.

St. Wilfred's, Harrogate (No. 542), is by Mr. emple Moore; it shows the interior only, hotographed from several points of view, ut even then difficult to make out without a lan, and hardly seen to advantage because nfinished, without floor in some parts and ith workmen about. The Gothic is of a holarly kind without eccentricity, yet not cking in niceties of detail that remove it from he merely antiquarian. Mr. Temple Moore lso sends the Bishop's Hostel, Lincoln (No. 37), a Gothic chapel; and Pusey House, xford (No. 538), in ¼-in. pencil elevation, a harming study in late Gothic. Besides is Khartoum Cathedral, Mr. Weir shows St. ndrew's Chapel, Westminster Cathedral No. 553), by photographs, the colour by eometric drawings of the decoration.

Of public buildings beyond those already eferred to the Liverpool School of Archiecture (No. 556) is perhaps the most mportant. Professor Reilly is to be ongratulated alike on his designing and in ime occupying so fine a home as this romises to be. Only a large well-coloured erspective is given—the figures are too tall nd dwarf the building—so the internal rrangements must be taken on trust. After he Florentine palace model, with ground floor lmost unbroken except by the entrance, bove is a large Doric Order of three-quarter olumns, the shafts apparently of brick, ike the rest of the walling, and over that a rieze of panels and square windows, and ll surmounted by a noble cornice—doubtless kylights or rear windows permit of its ncroachment on wall and window space; ndeed throughout one envies the amount of blank wall preserved. A frame of Mr. Lutyens' Delhi schemes (No. 552) shows photographs of wash drawings. The Ballroom exterior is admirable in its plain walling and far-reaching cornice, and internally the rectangular apartment has enough of interest in the openings of its wall, but the quite flat ceiling needs something to break up its surface; even painted lines would do, but more than the slight and spotty Pompeian decoration shown is required. For much the same reason the interior of the domed Durbar Hall (No. 551) is hardly satisfactory; itself resting on arches, with the Pantheon eye but minus its coffering, there is a want of articulation, and if a clear zone is desired it should not be broken into by more circles in the form of decorative panels. The Memorial Column (No. 551) is of a usual fluted Doric type, on a pedestal, itself on a sub-base, and surmounted by a piece of ornament that probably for Indians has some symbolical significance to justify its prominence; otherwise it is hopelessly coarse. The Colonial Palace, Gand (No. 546), by Mr. Caluwaers, is not equal to his Gothic work already noticed; the interior is singularly unimaginative. Another exhibition pavilion (No. 539) is only exhibition architecture, and a little commonplace. Sir R. Rowand Anderson sends photographs of some of his earlier work—(No. 533), the fine dome to Edinburgh University in severe Classic; sumptuous Gothic at Mount Stuart Chapel (No. 534); interior of the Antiquarians' Hall (No. 531), likewise Gothic, with provokingly assertive riveted ceiling girders; a dignified Georgian interior, the Senate House, St. Andrew's (No. 532)—there is a painting of this interior elsewhere in the exhibition; and the great Celtic memorial cross to Dean Ramsay. Other memorials are (No. 571) Mr. John Keppie's two from Glasgow Cathedral in the Italian manner, of coloured marbles, and two grave monuments in stone. Mr. James Miller has a coloured perspective of an important city block—tea-rooms and a picture-house in Glasgow (No. 565), of Carrara ware, the ground floor is of white marble, and has a great doorway with green marble columns and bronze capitals—a well-detailed composition in Empire style. The Royal (Dick) Veterinary College (No. 575), by Mr. David McArthy, is a large building, but even so it has too many features; a great Order in the centre with another in the wings only a little smaller is disturbing. In domestic work Sir Robert Lorimer's modest contribution, Kinellan (No. 572), is a very quiet square house that looks very like one of eighteenth-century date, but it may be modern; in any case the simple combined door and side windows with the approach of steps and open railing is delightful; parts of interior, too, have the same quality of reserve and delicacy. Besides the staircase noticed, Mr. Ernest Newton has several characteristic works:—House in the Grand Duchy of Luxemburg (No. 540), an exportation pure and simple, only the central court and the axial lay-out marking it off from the home article; Ardenrun (No. 547), where the feature is a porch in correct Classic; while (No. 541) is of old English cottage type—walls tile-hung, and real half-timber gabled porch, just a trifle antiquarian; Luckley, Wokingham (No. 544), is really more reasonable; No. 545 is a nicely-coloured small-scale geometric drawing of a house in Surrey. Heathcote (No. 522), by Mr. Lutyens, a photograph of a

Mr. Wm. Hunter McNab, F.R.I.B.A.

large country house almost too full of interest, of good Italian type, in stone with roll tiles on roof and, rather needlessly, on a mid-cornice; in the hall interior, stone finished, are some eccentric mouldings; the pillow frieze is overdone. Easterton (No. 520), by Mr. A. N. Paterson; photographic views of large additions to a house, externally very pleasing; there is a detached stone summer-house with upper story rather quaintly treated; within, one of the rooms has the ceiling architecturally treated with large cove and intersecting groins. Stobieside (No. 524), by Messrs. Leadbetter, Fairley, & Reid; in this is a room with a semiround barrel ceiling whose springing is only some 5 ft. from the floor—surely overdone; a segmental or elliptical form would permit of picture hanging; externally the seventeenth-century Scottish character is got very well and unaffectedly. Howbury (No. 528), a nice house of the English type, by Messrs. Mills & Shepperd; with some other pieces. Mr. McNab's interior of dining-room (No. 568) shows a rather formal projecting stone Tudor fireplace, wood panelled walls, and deep plaster beams with sloping sides, and the slight modelled work usually given that form. An interesting archæological essay is Mr. Kelly's academically-restored Aberdeenshire Castle, of date 1600, shown in scale drawings and brown wash; one would wish it carried a little further, giving sections of the apartments, their decoration and furniture. Hinton, Northamptonshire (No. 560), by Mr. James A. Morris; a frame of views of a very interesting house, early English Renaissance, full of delightful details. The same architect has also some wrought-iron gates, at Girvan, with good scrollwork, but rather affectedly bare at the centre, plain bars only; these make it look poverty-struck rather than simple. Other interiors, all shown by photographs, are Messrs. Stewart & Paterson's house at Auchterarder (No. 570), and Mr. Devlin's (No. 577), with plans in addition, all good taste, and still others pleasing enou but little more than furniture upholstery. On the whole the exhibit does not rise above a respectable level merit on the part of Scottish archite A good deal of its interest and value owes to English contributors. Certai photography is the best way of illustrat executed work; all the same, one may reg a little what is lost to draughtsmanship

◆

FIFTY YEARS AGO.

Breach of Apprenticeship Contract: Raymont *v.* Minton.

THIS was an action in the Court Exchequer for breach of covenant in a de of apprenticeship.

The defendant, who resided in Wilmingto square, covenanted to teach the plainti stepson the business of a builder, ornamen painter, and decorator, and to supply hi with meat, drink, and lodging. During t month's trial the young man was treat very well, but afterwards he was subjecte according to his account, to all kinds of i usage and indignities. Instead of bei taught the trade, he was employed as labourer; he had also insufficient food, a for a year and a half he had to sleep on fo chairs in the kitchen, which was swarmi with black beetles and cockroaches, and dress in an open area.

On the part of the defence there was complete denial of all these allegations, a counter-charges of misconduct were ma against the apprentice.

The jury, before retiring to consider th verdict, asked the learned judge wheth they had power to cancel the indenture apprenticeship.

Mr. Baron Martin: You have no pow to do that. You can only find damages f breach of covenant.

The jury, after a brief absence from cou found a verdict for the plaintiff—damage £29.

THE BUILDING TRADE.

THE REBUILDING OF BELGIUM.—III.

AFTER the war Belgium will be financially damaged in consequence of what she has undergone. Its Government ; no means of making good the large present enses which are being accumulated. The ritory which is occupied by the enemy has n exploited in the most tyrannical and dis- iest manner, and from the first days of the asion theft, robbery, and violence have been ictised by the Germans, both by soldiers, ierals, and administrators, including repre- itatives of the German royal houses.

What they could not take away they have stroyed, apparently for the pleasure of struction, while they have indulged their age instincts by illtreating women and ildren.

It is therefore necessary to wait until the ablishment of peace in order to develop the untry's resources.

But Mr. Asquith has pledged his word that ace shall not be restored until Belgium has en repaid all that she has lost during the ır, and said that she shall not suffer by the t that she had to withstand the brunt of rman aggression.

Belgium hopes that the Germans will have pay an indemnity for the damage done, and e industry of the population is sufficiently ll known to make us believe that financial ans will be found to carry out necessary rks.

The determination of the Belgian people to onstruct the nation's fortunes by independent tion has been recognised by the members of e Belgian Town Planning Congress.

At a meeting in November, 1915, it was reed that whatever was done should be done Belgians for Belgium.

Some proposals were excepted from this oad rule, and at the meeting a proposal ich had already received the approval of e Belgian Minister of Agriculture and Public orks was that a city or town should be tirely reconstructed out of international nds to form a memorial of the respect of e Allies for the part played by Belgium in e war.

This proposal has created enthusiasm and lights the pride of the people, but the great jority of them, having the choice of a autiful offering on the one hand or the storation by subscription and effort of the brary of Louvain, the monuments of Ypres d Nieuport, and the Cathedral of Dinant, would efer the last alternative, for in every country emorials will be built which will eloquently call the fraternity of the allied nations, eir aims and ideals, and the end of their eat trial. This sentiment is felt in France d Belgium, and we read in the *Builder* of ecember 3 last that the General Purposes mmittee of the London County Council knowledged the receipt of a letter from the yal Academy stating that at the instance the Institute of France the Academy have pressed their willingness to initiate a proposal the formation of a British Committee to sist in the restoration of the Library of uvain, and invite the Council to nominate delegate or delegates to serve on the Committee, d the London County Council agrees to point Major Ernest Grey and Mr. Andrew ylor to represent the Council on this mmittee.

We hope to see the monuments which have en the ornament and pride of our cities stored, though we also think of the commercial erests of the people after the restoration of ace.

Ought we to be disturbed as to the financial sition which will accompany the restoration this peace? We do not believe that in ming conferences on economical questions tween financiers and politicians the states- n of the allied Powers will fail to take adequate steps to hinder neutrals who have enjoyed peace while we have been engaged in the struggle to secure the rights of humanity, reaping the fruits of that peace to our disadvantage, but we believe it will be necessary in our common interests to impose a prohibitive tariff on their productions.

It will thus be necessary for them to use the millions gained at our expense during the war in investing them in our finances and industries. Such questions were doubtless discussed at the meetings which have taken place, and we have confidence that when peace comes the authorities will have made arrangements which will lead to the realisation of the ends we have indicated.

Charles Petein (Captain).

PARISH CHURCH, HULL.

The Archbishop of York recently consecrated the new parish church of St. Mary, Sculcoates. The new church takes the place of an old one, which has been demolished, and has been designed by Mr. Temple Moore, architect, of London. There is at present accommodation for 600 people, and this will be increased to 800 when the western part of the structure is completed. The cost of the work already done is over £5,800.

BUILDING MATERIALS FOR BRITISH INDIA.

The Officiating Director-General of Commercial Intelligence at Calcutta reports that a local firm is interested, as importers of building materials, in building and decorative specialities, such as porcelain tiles, stamped metal ceilings, collapsible gates, etc. United Kingdom manufacturers of the goods mentioned, and exporters of United Kingdom goods, desirous of doing business in India, may obtain the name and address of the firm referred to, and of the firm's shipping agents in London, on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C. In making application the reference number (185) should be quoted.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The Burgh Surveyor has been instructed to have the work carried out in connection with the installation of hot-water apparatus for the refreshment-rooms at the bathing station. Plans for the following buildings have been approved by the Plans Committee of the Aberdeen T.C.:—Two dwelling-houses, Rosebery-street, for Messrs. J. Shirras & Son, builders, per Mr. George Watt, architect; additions to engineering works at No. 80, Spring-garden, for Messrs. William M'Kinnon & Co., Ltd., engineers; additions and alterations in connection with premises, Hutcheon-street, for the Aberdeen Comb Works Company, Ltd., per Mr. William S. Boice, engineer (amended plan). The Public Health Committee of the Aberdeen T.C. has agreed to the application of Messrs. William Murray & Son, hide and tallow manufacturers, for the approval of the extension of their premises in George-street.

Aldershot.—The D.C. has instructed their Surveyor to prepare a specification for painting the old buildings at the Isolation Hospital, and the provision of two porcelain baths, and to invite tenders for the work.

Australia.—The Sydney Office of H.M. Trade Commissioner for Australia reports that the estimates submitted by the Commonwealth Treasurer to the House of Representatives include the following votes for additional works to be carried out, mostly in New South Wales:—Sydney Customs House, £5,000 (the total estimated cost of this undertaking is £30,000); Spectacle Island Naval Establishment, £6,204; Jervis Bay Naval College, £30,000; Lithgow Small Arms Factory, £30,800; Canberra Arsenal, £20,000; Post Offices, Stores, and Telephone Exchange in Sydney, £7,676; and Cockatoo Island Dockyard, £100,000.

Riley, d to carry on business as timber merchants, ilders, manufacturers, shipowners, saw-mills oprietors, etc. Nominal capital, £10,000 in 000 £1 Ordinary shares.

◆

LAW REPORT.

Official Referee's Court.
(Before Mr. Muir Mackenzie.)

Claim for Building Picture Palace:
lson Rae, Pixton, & Co., Ltd. v. Laycock.

In this action, the hearing of which occupied arly a week, Messrs. Wilson Rae, Pixton, Co., Ltd., builders, of Queen Victoria-street, C., sought to recover from Mr. Horace Scott ycock, of Great St. Helens, E.C., £546, lance of charge for converting Brixton Hall, re-lane, Brixton, into a picture palace. The fendant pleaded that the work was not in cordance with the contract, and counter- imed damages for breach of contract and lay in completing the work.

The Official Referee, in giving judgment, id that the first operative clause in the agree- ent, which was in writing, and was signed the managing director of the plaintiff mpany, was to the effect that the contract ould be carried out forthwith and with the most expedition to the satisfaction of the C.C. and the local authorities; but there s nothing in the contract which bound the aintiffs to complete by a certain date. He und that no verbal agreement to that effect d been proved, and that the plaintiffs did t know, as alleged, that the completion of e work by July 28 was necessary for the fendant's enterprise. There had been no each of contract by reason of delay. The xt issue was whether the work had been ne in accordance with the contract. The aintiffs, having substantially done the work, re entitled to the price. The defendant, wever, had made a long list of items which, said, had not been done in accordance with e specifications, the total of which amounted £309. The evidence as to this had been ry conflicting. Mr. Appleton, a surveyor, d a number of workmen had been called by e plaintiffs to say that the work had been operly done, and Mr. Stevens, a surveyor, d other workmen were called for the defence say that the materials were bad, and that e work was not in accordance with the speci- ations. As a result he found that the work d been done in such a way as to satisfy all asonable requirements. The defendant was titled, however, to certain allowances, nounting in all to £65 6s. 10d., and there as a claim by him for doors, gates, and her things which plaintiffs had taken away, though they had no right to do so. Builders d no right to remove property and take it r their own use. Property belonging to the fendant had been so removed, but defendant d put an exaggerated value upon it. He und the value of the things so taken to be 20. The counterclaim for damages had iled, and on an adjustment of the figures he und that the plaintiffs were entitled to 475 7s. 2d., and for that amount he gave dgment with costs. Judgment would be ven for costs of the action and counter- aim, as, in his opinion, the reduction had t affected the action.

Judgment was entered accordingly.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

—	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers' Labourers.

◆

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.
